HANDBOOK OF RESEARCH ON TEACHER EDUCATION

Enduring Questions in Changing Contexts

THIRD EDITION

EDITED BY
Marilyn Cochran-Smith
Sharon Feiman-Nemser
D. John McIntyre
and
Kelly E. Demers
Associate Editor

CO-PUBLISHED BY ROUTLEDGE/TAYLOR & FRANCIS GROUP
AND THE ASSOCIATION OF TEACHER EDUCATORS
Handbook of Research on Teacher Education, Third Edition

This volume provides a balance and perspective that enhances inquiry into teacher education. What the editors and authors have accomplished is to put research in context, apply research findings to relevant current issues, and draw on influential documents and current scholarship.

W. Robert Houston, University of Houston, United States; Editor, Handbook of Research on Teacher Education, First Edition—From the Foreword

The Handbook of Research on Teacher Education was initiated to ferment change in education based on solid evidence. The publication of the First Edition was a signal event in 1990. While the preparation of educators was then—and continues to be—the topic of substantial discussion, there did not exist a codification of the best that was known at the time about teacher education. The Second Edition (1996) built on the first to extend this comprehensive knowledge base. Reflecting the needs of educators today, this Third Edition takes a new approach to achieving the same purpose. Beyond simply conceptualizing the broad landscape of teacher education and providing comprehensive reviews of the latest research for major domains of practice, this edition aims to:

- stimulate a broad conversation about foundational issues;
- bring multiple perspectives to bear, including historical perspectives;
- provide new specificity to topics that have been undifferentiated in the past; and
- include diverse voices in the conversation.

Taking all of these aspirations into account, the Editors, with the help of an Advisory Board, identified nine foundational issues and, to bring these issues to life, translated them into a set of focal questions:

- What’s the point? The purposes of teacher education
- What should teachers know? Teacher capacities: knowledge, beliefs, skills, and commitments
- Where should teachers be taught? Settings and roles in teacher education
- Who teaches? Who should teach? Teacher recruitment, selection, and retention
- Does difference make a difference? Diversity and teacher education
- How do people learn to teach? Teacher learning over time
- Who’s in charge? Authority in teacher education and licensure policy
- How do we know what we know? Research and teacher education
- What good is teacher education? The place of teacher education in teachers’ education
The Handbook is organized around these questions, with a common four-part structure in each section. The Introduction, by the section editor, explains why the core issue has persisted, how it has been conceptualized over time, and why the particular framing chapters, artifacts, and commentators were chosen for the section. The framing chapters focus on different dimensions or facets of the issue as well as different ways of thinking about it. The artifacts—historical and contemporary documents, many of them classics in teacher education—demonstrate the enduring nature of the issue and how it has been conceptualized or debated over time. Each section concludes with commentaries written by researchers, teachers, teacher educators, policy makers, or foundation directors that reflect a wide spectrum of political and ideological stances.

PART 1 WHAT’S THE POINT? 1
The purposes of teacher education
EDITOR: DAVID T. HANSEN

Framing chapters 3

1 Introduction: why educate teachers? 5
DAVID T. HANSEN

2 Values and purpose in teacher education 10
DAVID T. HANSEN

3 Teacher education in a democratic society: learning and teaching the practices of democratic participation 27
EMILY ROBERTSON

4 The moral and epistemic purposes of teacher education 45
HUGH SOCKETT

Artifacts 67

1.1 Ralph Waldo Emerson, “The American scholar” (1837) 69

1.2 W. E. B. Du Bois, “Of the coming of John” (1903) 87
1.3 Jane Addams, “Socialized education” (1910)  

1.4 John Dewey, “The need for a philosophy of education” (1934)  

Commentaries  

5 Is deliberative democracy enough in teacher education?  
Michael W. Apple  

6 Advancing the public purpose of schooling and teacher education  
John I. Goodlad  

7 A thought from another world: the professional education of Black teachers in Georgia, 1930–1965  
Vanessa Siddle Walker

PART 2 WHAT SHOULD TEACHERS KNOW?  
Teacher capacities: knowledge, beliefs, skills, and commitments  
Editor: Carl A. Grant

Framing chapters  

8 Teacher capacity: introduction to the section  
Carl A. Grant  

9 Rethinking teacher capacity  
G. Williamson McDiarmid and Mary Clevenger-Bright  

10 Teacher capacity for diverse learners: what do teachers need to know?  
Tyrone C. Howard and Glenda R. Aleman  

11 Teacher capacity and social justice in teacher education  
Carl A. Grant and Vonzell Agosto

Artifacts  

2.1 James Baldwin, “A talk to teachers” (1963)  
2.2 Paulo Freire, “Teachers as cultural workers: letters to those who
dare teach” (1998)
Source: Paulo Freire, Teachers as Cultural Workers: Letters to Those

2.3 M. Greene, “The dialectic of freedom” (1988)
Source: M. Greene, The Dialectic of Freedom, Teachers College
Press, 1988, pp. 117–135

2.4 Katrina B. Flores, “They’re calling us names” 226

Commentaries

12 Do you see what I see? Teacher capacity as vision for education
in a democracy 231
MAUREEN D. GILLETTE AND BRIAN D. SCHULTZ

13 Partial movements toward teacher quality . . . and their potential for
advancing social justice 238
KEVIN K. KUMASHIRO

14 Dismantling dichotomies in teacher education 243
PAM GROSSMAN, MORVA MCDONALD, KAREN HAMMERNES, AND
MATTHEW RONFELDT

15 Teacher capacity for diversity 249
DONNA M. GOLLNICK

PART 3 WHERE SHOULD TEACHERS BE TAUGHT? 259
Settings and roles in teacher education
EDITOR: KENNETH ZEICHNER

Framing chapters 261

16 Introduction: settings for teacher education 263
KENNETH ZEICHNER

17 Teacher education programs as sites for teacher preparation 269
KENNETH ZEICHNER AND HILARY G. CONKLIN

18 An uneasy relationship: the history of teacher education in
the university 290
DAVID F. LABAREE

19 What kind of experience? Preparing teachers in PDS or
community settings 307
MARILYNN BOYLE-BAISE AND D. JOHN McINTYRE
Artifacts

Commentaries

20 Rigor and relevance in teacher preparation 373
MICHELLE RHEE AND KARLA OAKLEY

21 Settings for teacher education: challenges in creating a stronger research base 379
SHARON P. ROBINSON

22 Settings are more than sites 388
W. ROBERT HOUSTON

PART 4 WHO TEACHES? WHO SHOULD TEACH? 395
Teacher recruitment, selection, and retention
EDITOR: A. LIN GOODWIN

Framing chapters

23 Defining teacher quality: is consensus possible? 399
A. LIN GOODWIN

24 Who is teaching? Does it matter? 404
KAREN ZUMWALT AND ELIZABETH CRAIG

25 Teachers of color: quality and effective teachers one way or another 424
MARY E. DILWORTH AND ANTHONY L. BROWN

26 The next generation of teachers: who enters, who stays, and why 445
SUSAN MOORE JOHNSON AND SUSAN M. KARDOS
Teacher educators as gatekeepers: deciding who is ready to teach

A. LIN GOODWIN AND CELIA OYLER

17.1 A framework for thinking about teacher education programs

A4.3 “... Samuel R. Ward, who had himself taught in blacks schools in both New Jersey and New York. He emphasized that blacks should insist on black teachers because blacks ought to support black talent” (p. 95)

A4.4 The first Mexican school in El Paso during the 1880s. Mexican American parents developed a school to teach English to Mexican students with limited English proficiency because the local El Paso school officials refused to teach English to Spanish-speaking students. The community turned to an elderly man named Olivas Villanueva Aoy, who agreed to open a private school with the sole purpose of teaching Mexican children English to prepare them for public schools. Historian Mario Garcia (1981) notes that by the 1890s Aoy, with the help of two Mexican assistants was able to teach close to one hundred first and second graders. (Text by Anthony L. Brown)

A4.5 A Native American teacher at the Carlisle School during the early 1900s teaching American Indian weaving. The school during this period began to hire more Native American teachers and they often infused into the school curriculum the cultural and ethnic backgrounds of the students. (Text by Anthony L. Brown)

Notes on contributors

Vonzell Agosto is a former special education teacher with the Chicago Public Schools. As a doctoral student in the department of Curriculum and Instruction at the University of Wisconsin-Madison, her research interests include teacher education with a focus on multicultural education and special education.

Soyeon Ahn is a Doctoral Candidate in Measurement and Quantitative Methods in the College of Education at Michigan State University and is interested in developing statistical models for complicated data structures. Her current research focuses on the application of latent variable models to synthesizing evidence in education.

Glenda R. Aleman is an Assistant Professor in the Teacher Education Department at California State University, Dominguez-Hills.

Katherine C. Boles is a Lecturer on Education at the Harvard Graduate School of Education, teaches about school reform and new forms of teacher leadership. A classroom teacher for over 25 years, she co-founded (with Vivian Troen) one of the first professional development schools in the country, and co-authored (with Troen) *Who’s Teaching Your Children? Why the Teacher Crisis is Worse Than You Think and What Can Be Done About It*.

Hilda Borko is a Professor in the School of Education, University of Colorado at Boulder. A member of the National Academy of Education, she was President of the American Educational Research Association 2003–2004, Editor of the *American Educational Research Journal*, Section on Teaching, Learning and Human Development 1988–1992, and is currently editor (with Dan Liston and Jennie Whitcomb) of the *Journal of Teacher Education*.

Marilynne Boyle-Baise is a Professor in the Department of Curriculum and Instruction at Indiana University’s School of Education. She was a member of the Board of Directors for the National Council for the Social Studies (NCSS) from 2004–2007. She was selected as a Faculty Fellow for Service Learning for 2006–2007. She currently serves as an Academic Advisor for the Center on Congress.

Anthony L. Brown is an Assistant Professor in the Department of Curriculum and
Instruction at the University of Texas at Austin. He completed his Ph.D. in curriculum and instruction from the University of Wisconsin-Madison. Anthony is a former classroom teacher and school administrator. His scholarly interests focus on the educational experiences of African American males and curriculum studies.

Kathryn Byrnes is a Doctoral Candidate in Instruction and Curriculum at the University of Colorado at Boulder. Her research interests include contemplative education, spirituality and education, and teacher education. She is the former managing editor of the *Journal of Teacher Education* and is a visiting instructor at Colorado College, teaching Educational Psychology and Introduction to Psychology courses.

Jinyoung Choi is a recent graduate of Michigan State University, where she received a Ph.D. in Curriculum, Teaching, and Educational Policy. She is currently a Full-Time Instructor in the Department of Elementary Education at Ewha Women’s University in South Korea.

Victoria Chou is Dean and Professor of the University of Illinois at Chicago College of Education. She chairs UIC’s Council on Teacher Education and recently served as Chair of the Governing Board of the National Teachers Academy in Chicago.

Mary Clevenger-Bright is a Doctoral Student in Teacher Education, a Research Assistant in the Teacher Education Program, and a University Supervisor at the University of Washington in Seattle. A former kindergarten and primary grade teacher and literacy leader in the public schools, she is interested in researching, writing, and teaching about connections within and between settings in teacher preparation, and about sociocultural influences in early childhood development and education.

Reneé T. Clift is a Professor in the Department of Curriculum and Instruction at the University of Illinois at Urbana-Champaign and is the Director of the Illinois New Teacher Collaborative. Her research interests include teacher learning and development and the use of technology for preservice and continuing teacher education.

Marilyn Cochran-Smith is the John E. Cawthorne Millennium Chair in Education and directs the Doctoral Program in Curriculum and Instruction at Boston College’s Lynch School of Education. She was President of the American Educational Research Association in 2004–2005, co-chair of the AERA Panel on Research and Teacher Education and Editor of the *Journal of Teacher Education* from 2000–2006.

Hilary G. Conklin is an Assistant Professor in the Department of Elementary and Social Studies Education at the University of Georgia. She teaches undergraduate and graduate courses in social studies education and has research interests in the preparation of middle school teachers, social studies teacher education, and teacher learning.

Elizabeth Craig is Assistant Professor in the Master of Arts in Teaching program at Bard College. Scholarly interests focus on the demographics and quality of the public school teaching force; student resistance and school failure; and the development of pedagogical content knowledge in social studies teachers. Recent publications include chapters in *Studying Teacher Education: The Report of the AERA Panel on Research and Teacher Education* (co-authored with Karen Zumwalt).

Edward Crowe is a consultant on teacher quality reform, K-16 policy, and higher education information systems and strategic planning. He was the first director of the federal Title II Grants Program, and now works with the Carnegie Corporation, the
NYC Partnership for Teacher Excellence, the Hunter Foundation of Scotland, the Committee on Teacher Preparation of the National Research Council, and the National Commission on Teaching and America’s Future.

Linda Darling-Hammond is the Charles E. Ducommun Chair in Education at Stanford University and is co-director of the Stanford Educational Leadership Institute and School Redesign Network. She is a past president of AERA, a member of the National Academy of Education, and author or editor of more than 250 publications on education policy and practice, including, most recently, Powerful Teacher Education: Lessons from Exemplary Programs.

Danné E. Davis is an Assistant Professor of Elementary Education at Montclair State University. Her primary research centers on the process of “consultative interaction” between student teachers and schoolchildren. Dr. Davis is currently examining the contribution of Elizabeth Jennings, an African American public school teacher involved in issues of social justice during the nineteenth century.

Kelly E. Demers is a Doctoral Candidate in Curriculum and Instruction at Boston College. Her research interests include multicultural education and anti-racist education. She is currently completing her doctoral dissertation, which focuses on the way that White teachers’ ideology informs their construction of race.

Mary E. Dilworth is Vice President for Higher Education and Research at the National Board for Professional Teaching Standards. Prior to joining the Board, she was a senior officer with AACTE. She is nationally known for her work in the areas of teaching and teachers’ professional development with an emphasis on racial, ethnic and linguistic diversity.

Daniel Fallon is Program Director for Higher Education at Carnegie Corporation of New York. He designed and has administered Teachers for a New Era, a national program of philanthropic support to selected institutions leading efforts to rethink teacher education. He is Professor Emeritus of Psychology and Professor Emeritus of Public Policy at the University of Maryland, College Park.

Sharon Feiman-Nemser is the Mandel Professor of Jewish Education at Brandeis University and founding director of the Mandel Center for Studies in Jewish Education. Before coming to Brandeis, she was a Professor of Teacher Education at Michigan State University where she served as Senior Researcher with several national research centers. A leading scholar of teacher education, she has written extensively about mentoring, new teacher induction, teacher learning and the curriculum and pedagogy of teacher education.

Robert E. Floden is University Distinguished Professor of Teacher Education, Measurement and Quantitative Methods, and Educational Psychology at the Michigan State University College of Education. He is a member of the National Academy of Education and has been Editor of Review of Research in Education, Features Editor of Educational Researcher, and President of the Philosophy of Education Society.

Susan Florio-Ruane is Professor of Teacher Education at Michigan State University and recipient of the university’s Distinguished Faculty Award. Her book, Teacher Education and the Cultural Imagination, won awards from the National Reading Conference and the American Educational Research Association. She served as President of the Council on Anthropology and Education and the National Council for Research on Language and Literacy.
Kim Fries is an Assistant Professor at the University of New Hampshire. Her areas of interest include research on teaching and teacher education. She is presently the President of the New England Educational Research Organization (the regional affiliate to the American Educational Research Association). She served as the Project Manager for the AERA Panel on Research and Teacher Education.

Mary H. Futrell is the Dean of the George Washington University Graduate School of Education and Human Development and is a Former President of the National Education Association. Dr. Futrell is chair of the Holmes Partnership Board and is a member of the Boards of the National Society for the Study of Education, The National Commission on Teaching and America’s Future, The Kettering Foundation, Lynchburg College and the Teachers Support Network.

Maureen D. Gillette is Dean of the College of Education at Northeastern Illinois University in Chicago. Her research focuses on urban education and preparing culturally responsive teachers. As former director of the Paterson Teachers for Tomorrow project, she designed and implemented a teacher education pipeline project to recruit and prepare teachers of color. Maureen is co-author of the book, *Learning to Teach Everyone’s Children: Equity, Empowerment, and Education that is Multicultural*.

Donna M. Gollnick is Senior Vice President of the National Council for Accreditation of Teacher Education (NCATE) where she oversees accreditation activities. She is the co-author of the textbook, *Multicultural Education in a Pluralistic Society* and other teacher education textbooks. She is past-president of the National Association for Multicultural Education (NAME).

John I. Goodlad is a Senior Fellow in the College of Education of the University of Washington and President of the Institute for Educational Inquiry in Seattle. He is author, co-author, or editor of approximately 40 books and yearbooks. He is past-president of AERA and AACTE and has received various awards, primarily for his work in public schooling, as well as honorary degrees from 20 universities in the United States and Canada.

A. Lin Goodwin is Professor of Education in the Department of Curriculum and Teaching at Teachers College, Columbia University, and has been engaged in the preparation of teachers for over 20 years. She also serves as Associate Dean for Teacher Education and School-Based Support Services, a position she has held since September 2005.

Carl A. Grant is a Hoefs-Bascom Professor in the Department of Curriculum and Instruction and Professor in the Afro-American Studies Department at the University Wisconsin-Madison. He is a past President of the National Association For Multicultural Education and Chair of the AERA Publication Committee 2004–2007.

Jaime Grinberg is a Professor of Educational Foundations at Montclair State University. He has published journal articles, books, and book chapters in Spanish and English on teacher education and professional development vis-à-vis the education of Latina/o students. He has been the director, co-director, and presently the faculty advisor to the Montclair State University Network for Educational Renewal.

Pam Grossman is Professor of Education at Stanford University. Her research interests include teacher education, the teaching of English in secondary schools, and the teaching of practice in professional education. A Past-President of Division K (Teaching and Teacher Education) of AERA, she served as a member of both the AERA Panel on
Karen Hammerness is a Research Associate with Stanford University. In Spring, 2007, she was a Visiting Professor at Leiden University in The Netherlands. Her research focuses upon teacher preparation practices and policies, as well as upon teacher's ideals and visions. Her book, Seeing Through Teachers’ Eyes: Professional Ideals and Classroom Practices, was published last year by Teachers College Press.

David T. Hansen is Professor and Director of the program in Philosophy and Education at Teachers College, Columbia University. He is the author of The Call to Teach, Exploring The Moral Heart of Teaching, and other works on the practice of teaching. He was President of the John Dewey Society in 2003–2005 and is President-Elect of the Philosophy of Education Society for 2008–2009.

Frederick M. Hess is a Resident Scholar and Director of Education Policy studies at the American Enterprise Institute. He is executive editor of Education Next and a member of the review board for the Broad Prize in Urban Education. His many books include Spinning Wheels, Common Sense School Reform, and No Child Left Behind: A Primer.

W. Robert Houston is the John and Rebecca Moores Professor and Executive Director, Institute for Urban Education at the University of Houston. Author of over 40 books and hundreds of journal articles and research papers, he was Editor of the first Handbook of Research in Teacher Education in 1990. In 1997 ATE named him the first Distinguished Educator of the year. In 2002, he received the prestigious Pomeroy award from AACTE for his contributions to education.

Tyrone C. Howard is an Associate Professor of Education in the Graduate School of Education and Information Studies at the University of California, Los Angeles. His research interests include teacher education, multicultural education, and the social and political context of urban schools. He is the past chair of the College University Faculty Assembly and Associate Editor of Theory and Research in Social Education.

David G. Imig is a Professor of Practice at the University of Maryland, College Park and serves as Coordinator for the Carnegie Project on the Education Doctorate for the Carnegie Foundation and the Council of Academic Deans in Research Education Institutions. Dr. Imig served as President and CEO of AACTE from 1980–2005. He currently is serving as chair of the National Society for the Study of Education.

Scott R. Imig is an Assistant Professor at the University of North Carolina Wilmington’s Watson School of Education. He directs the University’s curriculum, instruction, and supervision program. From 2003–2006 he ran the University of Virginia’s Teaching Assessment Initiative, the research component of UVA’s Teachers for a New Era grant.

Richard M. Ingersoll is a Professor of Education and Sociology at the University of Pennsylvania. His book, Who Controls Teachers’ Work? Power and Accountability in America’s Schools, published by Harvard University Press, was awarded the 2004 Outstanding Writing Award from the American Association of Colleges for Teacher Education.

Jacqueline Jordan Irvine is the Charles Howard Candler Professor of Urban Education at Emory University. Her books include Black Students and School Failure, Growing Up African American in Catholic Schools, Critical Knowledge for Diverse Students,

Tina Jacobowitz is Professor of Education at Montclair State University. She founded Montclair’s Office of the Agenda for Education in a Democracy, sponsoring professional development and research on teaching in a democracy and for social justice. She is co-author of Introduction to Education: Teaching in and for a Democracy, forthcoming from McGraw Hill.

Susan Moore Johnson is the Pforzheimer Professor of Teaching and Learning at the Harvard Graduate School of Education, where she served as Academic Dean from 1993 to 1999. She is director of the Project on the Next Generation of Teachers, which examines how best to recruit, support, and retain a strong teaching force.

Susan M. Kardos is the director of a large community fund and school improvement project in greater-Boston and a researcher at the Project on the Next Generation of Teachers at Harvard University. Her research includes work on professional culture, new teacher induction and mentoring, school leadership, and education policy. She is co-author of Finders and Keepers: Helping New Teachers Survive and Thrive in Our Schools.

Mary M. Kennedy is Professor of Teacher Education at Michigan State University. She has published numerous articles and books about teacher knowledge and teacher thinking and about the role of policy and research in influencing teaching.

Joyce E. King is the Benjamin E. Mays Chair for Urban Teaching, Learning, and Leadership and Professor in the Department of Educational Policy Studies at Georgia State University. Her scholarship addresses the role of culture and community knowledge in effective teaching and teacher preparation, Black studies epistemology and curriculum change, and she is co-editor of The Review of Educational Research.

Kevin K. Kumashiro is an Associate Professor of Policy Studies at the University of Illinois-Chicago College of Education, and the founding director of the Center for Anti-Oppressive Education. He is author of the award-winning book, Troubling Education, and more recently, Against Common Sense: Teaching and Learning toward Social Justice.

David F. Labaree is a Professor and Associate Dean for student affairs in the Stanford University School of Education. He was President of the History of Education Society (2004–2005), Vice President for Division F (History of Education) of the American Educational Research Association (2003–2006), and member of the AERA executive board (2004–2006).

Meghna Antani Lipcon is a fifth grade math and science teacher at Broad Acres Elementary School in Silver Spring, Maryland. She received her master’s degree in elementary education from Teachers College in 2001. Since achieving National Board Certification in 2005, Meghna has coordinated the candidate support program in Howard County, Maryland. In addition, Meghna supports National Board candidates in Montgomery County, Maryland by planning and implementing effective Saturday Candidate Support Sessions and coaching individual candidates.

John Loughran is the Foundation Chair in Curriculum and Professional Practice in the Faculty of Education, Monash University and Associate Dean. His research has spanned both science education and the related fields of professional knowledge,
reflective practice and teacher research. He was co-editor of the International Handbook of Teaching and Teacher Education and is co-editor of the journal *Studying Teacher Education*.

**Tamara Lucas** is Associate Dean of the College of Education and Human Services at Montclair State University. Her work has focused on the education of culturally and linguistically diverse students and the preparation of their teachers. Her publications include two books—most recently, *Educating Culturally Responsive Teachers: A Coherent Approach*, with Ana María Villegas (2002).

**G. Williamson McDiarmid** is the Boeing Professor of Teacher Education in the University of Washington’s College of Education. He previously served as Co-Director of the National Center for Research on Teacher Learning at Michigan State University and Director of the Institute of Social and Economic Research at the University of Alaska.

**Morva McDonald** is an Assistant Professor of Education in the areas of teacher education and curriculum and instruction at the University of Washington’s College of Education. Her research interests include a focus on teacher education and the preparation of teachers for diversity as well as students’ opportunities to learn in and out of school.

**D. John McIntyre** is a Professor in the Department of Curriculum and Instruction with a specialization in teacher leadership at Southern Illinois University Carbondale. He was President of the Association of Teacher Educators (ATE) in 1992–1993, a recipient of ATE’s Distinguished Research Award in Teacher Education and co-editor of ATE’s Research in Teacher Education Yearbook series from 1995–2000.

**Nicholas M. Michelli** is Presidential Professor in the Ph.D. program in urban education at City University of New York’s Graduate Center, serves as a member of the New York State Professional Standards and Practices Board for Teaching, the Executive Committee of the National Network for Educational Renewal, and is editor of the McGraw Hill Teacher Education Series. He received AACTE’s Pomeroy Award for Contributions to Teacher Education.

**David H. Monk** is Professor of Educational Administration and Dean of the College of Education at Pennsylvania State University. He is the author of numerous publications dealing with economic aspects of education policy and is the co-editor of *Education Finance and Policy* (MIT Press). He is a past president of the American Education Finance Association.

**Frank B. Murray** is H. Rodney Sharp Professor in the School of Education and the Department of Psychology at the University of Delaware and served as Dean of the College of Education between 1979 and 1995. Currently, he is President of the Teacher Education Accreditation Council in Washington, DC. For his contributions to the fields of child development and teacher education, he was awarded an honorary doctorate from Heriot-Watt University in Edinburgh, Scotland.

**Karla Oakley** serves as Vice President of Training and Certification for the New Teacher Project (TNTP), a national non-profit organization that has recruited, trained or certified approximately 23,000 teachers since 1997. Karla began her career in education as a teacher in 1991, and has since worked as a teacher developer, assessor, curriculum developer, and program manager.

**Celia Oyler** is an Associate Professor in the Department of Curriculum and Teaching at
Teachers College, Columbia University. She directs the Inclusive Education Program and is the author of Learning to Teach Inclusively: Student Teachers’ Classroom Inquiries and Making Room for Students: Sharing Authority in Room 104. Before obtaining her Ph.D., she was a classroom teacher for 15 years.

Michell Rhee founded The New Teacher Project in 1997 and served as its CEO and President for 10 years. Today, the organization is recognized as an authority on the recruitment, selection, training and hiring of new teachers for urban and high-poverty schools. Ms. Rhee left the organization in 2007 to become Chancellor of the Washington, DC public school system.

Emily Robertson is dual Associate Professor of Education and Philosophy at Syracuse University. She is former interim dean and associate dean of the School of Education and a past president of the Philosophy of Education Society. Her research focuses on philosophy of education, especially on the civic, moral, and epistemic ends of education.

Sharon P. Robinson is currently AACTE President and Chief Executive Officer. She is the former president of the ETS’s Educational Policy Leadership Institute, served as Assistant Secretary of Education with the U.S. Department of Education’s Office of Educational Research and Improvement and held a variety of leadership positions in the National Education Association. She was also interim deputy director of the National PTA’s Programs and Legislation office.

Carol R. Rodgers is an Associate Professor of Education at the University at Albany, State University of New York. Her interests include reflective practice, John Dewey, presence in teaching, the inner life of the teacher, and the history of progressive teacher education. Her most recent publications include “Presence in teaching,” Teachers and Teaching: Theory and Practice (2006, co-authored with Miriam Raider-Roth), and “Attending to student voice,” Curriculum Inquiry (2006).

Matthew Ronfeldt is a doctoral candidate in Teacher Education at the Stanford University School of Education. His research focuses on the adaptation process of novice teachers and clinical psychologists during their first year of professional preparation. Previously he taught middle school math and science in Oakland, CA and coordinated a teacher research group.

Cheryl L. Rosaen is Associate Professor of Teacher Education at Michigan State University and a faculty Team Leader in a five-year Teacher Preparation Program. She teaches courses in literacy methods and teacher education, and conducts research on learning to teach literacy, and the role technology can play in supporting teacher learning.

Karen Sakash is a Clinical Associate Professor in Education at the University of Illinois at Chicago. She coordinates the graduate elementary education program and is a bilingual teacher educator in the Department of Curriculum and Instruction. She has a Ph.D. from the University of Illinois at Chicago in Public Policy Analysis with a specialization in educational program evaluation and administration.
Brian D. Schultz is an Assistant Professor at Northeastern Illinois University in Chicago. His research focuses on developing democratic curricula surrounding students’ concerns. His forthcoming book, Spectacular Things Happen Along the Way: Lessons from an Urban Classroom (Teachers College Press), details a yearlong justice-oriented project where his fifth-grade students from Chicago’s Cabrini Green fought for an equitable school building.

Katherine H. Scott is a developmental psychologist whose work focuses on adult development. She is an independent scholar and educational consultant in Cambridge, Massachusetts.

Michael W. Sedlak is a Professor of History of Education and Associate Dean for Academic Affairs in the College of Education at Michigan State University. He also coordinates the doctoral program in Educational Policy. He has published widely in the history of professional education and American high school policy and reform.

Christine E. Sleeter is Professor Emerita in the College of Professional Studies at California State University, Monterey Bay. Her research focuses on anti-racist multicultural education and teacher education. She is the author of about 100 articles and book chapters, and several books, including Facing Accountability in Education and Un-Standardizing Curriculum (Teachers College Press), and Doing Multicultural Education for Achievement and Equity (with Carl Grant, Routledge).

Hugh Sockett is Professor of Education at George Mason University (GMU) in the Department of Public and International Affairs of the College of Humanities and Social Studies. He was Dean of Education at the University of East Anglia (UK) (1982–1986) and Director of the GMU Institute for Educational Transformation (1991–1998). He has been a member of the AACTE Task Force on Teacher Education as a Moral Community since 1997.

Eran Tamir is a Post-Doctoral Research Fellow at the Mandel Center, Brandeis University. A sociologist and educational policy analyst, his research focuses on the social and political context of educational policy and teacher professionalism. He is currently leading the “Choosing to Teach” project, a collaborative study of new teachers in Jewish, Catholic and public schools.

Vivian Troen is a Lecturer at Brandeis University and a consultant on professional development school initiatives. An elementary school teacher for over two decades, she now lectures and leads workshops nationally and internationally on teaming, mentoring and teacher development. With Katherine Boles, she is co-founder of one of the first professional development schools in the country and co-author of Who’s Teaching Your Children? Why The Teacher Crisis is Worse Than You Think and What Can Be Done About It.

Ana María Villegas is Professor of Curriculum and Teaching at Montclair State University. Her research focuses on culturally responsive teaching, preparing teachers for a diverse student population, and preparing and retaining a diverse teaching force. She was the 2004 recipient of the Margaret B. Lindsay Award for Distinguished Research in Teacher Education from the American Association of Colleges for Teacher Education.

Vanessa Siddle Walker is a Professor of Educational Studies at Emory University. Her research articles and books on the segregated schooling of African American children in the south have received numerous regional and national awards, including the Grawmeyer Prize for Education and the AERA Raymond Cattell Early Career Award.
for Programmatic Research. Her research has also appeared on the PBS Series, *School: The Story of American Education*.

**Steven Weiland** is Professor of Teacher Education and Higher Education at Michigan State University. Prior to his appointment at MSU he taught English and American Studies at the Universities of Michigan, Iowa, and Minnesota.

**Joel Westheimer** is University Research Chair in Democracy and Education at the University of Ottawa where he founded and co-directs *Democratic Dialogue*, (www.democraticdialogue.com). He is editor and contributing author, most recently, of the book *Pledging Allegiance: The Politics of Patriotism in America’s Schools* (www.pledgingallegiance.org) and author of *Among Schoolteachers: Community, Autonomy, and Ideology in Teachers’ Work* (Teachers College Press).

**Jennifer A. Whitcomb** is the Assistant Dean for Teacher Education at the University of Colorado at Boulder. She is co-editor of the *Journal of Teacher Education* (2006–2009). Her research interests focus on the intersection between and among the practice and structure of teacher education and teacher learning.

**Suzanne M. Wilson** is Chair and Professor in the Department of Teacher Education at Michigan State University. She also directs the Center for the Scholarship of Teaching. She has written widely on teacher education and curriculum policy, teacher learning and professional development, and mathematics and history teaching.

**Kenneth Zeichner** is Hoefs-Bascom Professor of Teacher Education and Associate Dean of the School of Education at the University of Wisconsin-Madison.

**Karen Zumwalt** is the Edward Evenden Professor of Education in the Department of Curriculum and Teaching, Teachers College, Columbia University where she works with doctoral and master’s students. She served as Dean of the College and Vice President for Academic Affairs from 1995–2000. Along with Elizabeth Craig, she wrote two chapters for AERA’s (2005) *Studying Teacher Education: The Report of the AERA Panel on Research and Teacher Education*. 
Foreword

W. Robert Houston

Few matters are more important to our nation’s future than the education of its future citizens—or so neglected. At a time when competition throughout the world increases the need for more effective education, our nation vacillates in its support. With the advent of comprehensive post-industrial changes, the necessity of a strong, effective education has become even more vital. The technological era has ushered in a world-wide revolution whose implications are at least as far-reaching as the industrial revolution of over a century earlier.

Teacher education today is far different than it was 50 or 100 years ago. Teacher preparation and professional development are provided by a wider range of institutions; their programs are more complex and their quality more divergent. Prospective teachers have a broader array of potential professions from which to choose and researchers are exploring more varied problems. Yet, despite all the changes in teacher education, the major issues under-girding the profession are as paramount as ever. Understanding these changes and their effects on educational practice, and considering them in light of several enduring issues, requires careful and continual examination.

Educational research, the industrial revolution, and technology

The industrial revolution reshaped education in its image. Schools were expected to instruct children and youth based on the needs of industry (i.e. reading, writing, and arithmetic). Schools were organized along factory lines with groups of students following directions and individual students advancing from one grade to the next each year.

The technological revolution has radically changed society, the workplace, and the knowledge needed in the twenty-first century. One only has to compare agrarian life in America in 1907, 100 years ago, with the horseless carriage and airplane flight in their infancy, or even 1957, fifty years ago, to recognize the vast differences from today. The computer, internet, email, i-pods, cell phones, digital technology, color television, and instant communication have reshaped not only business but also education and the activities and values of children and youth. The population of the country has not only increased from 87 million in 1907 to 172 million in 1957 to over 300 million in 2007, but shifted from primarily rural to urban, with concomitant changes in culture, experiences, and aspirations.

Educational institutions, however, have been slow to engage the new reality—to draw on world-wide communication, massive data storage, retrieval, and analysis, and transportation that shrinks the globe. Evidence indicates this is changing. Schools have wireless connectivity and an increasing number of computers and advanced technology. Three years ago, the Houston Independent School District purchased 15,000 laptop computers so all teachers in the district would have one to bolster their lessons.
Technological challenges have been intensified by increased ethnic and socio-economic diversity in American schools and world-wide competition for well-educated graduates and economic dominance. In the next decade, at-risk students may be defined more by lack of access to technology in their homes than by their ethnicity, gender, or economic status.

Technology is beginning to reshape schooling. Elementary school students are communicating via the internet with children in other countries, not only learning to write but also learning about another culture. The evening news brings world events into the home. High school students are conducting science experiments about phenomena that were unknown fifty years ago. American enterprises compete with industries throughout the world while political events ricochet around the earth. Education is more vital than ever because students today will be competing for the best jobs with people throughout the world. We have indeed moved into the global village where events anywhere affect people everywhere. Such tsunami events are fostering massive changes in the education of teachers.

**Enduring issues**

Change is an inherent part of our culture, our environment, our heritage, and our future. Despite programmatic changes and extensive research, a number of issues in teacher education have persisted. How extensive should knowledge of content and pedagogy be in preparing teachers? What is the balance between them and what is the best institution (workplace or academic institution) in which to prepare teachers? To what extent should teachers be prepared to meet the special needs of individual students from varied ethnicities, economic conditions and disadvantages, learning disabilities, and special gifts and talents? In what ways does brain research contribute to improved learning? What is the role of research in teacher preparation?

The symbiotic relationship between research and practice continues to be a Gordian Knot that has yet to be untied, although several generations of researchers have contributed to our understanding. Change in human knowledge and behavior is so complex but research relies on proxies for learning and generalizations that mask underlying differences.

**Effective programs built on knowledge**

Isaac Newton once said, “If I have seen farther, it is because I stood on the shoulders of giants.” Until research is systemic, developmental, and focused on the real needs of educational enterprises, little progress will be made. Without a firm foundation, programs and innovations are based on slogans and panaceas. Many educators and concerned citizens admit that no simple solution can correct the problems of education, yet simple remedies abound.

Knowledge is not static but dynamic, changing, growing, evolving. What is known today may be antiquated tomorrow, and perhaps even wrong. Those persons who are not able to inquire into their discipline soon find themselves unable to contribute to it nor even to understand it. The half-life of most innovations in education is about three years, the time required to complete an externally funded project. Nominal mutations occur as the nomenclature changes—goals and objectives, competencies and proficiencies, outcomes, and now standards, all basically deal with similar concepts.

If education is to approach the stature of the sciences, educational researchers will need to build on previous explorations, sharpen their studies, and provide a basis for further,
more refined research agendas. Such continuity requires teams of researchers, not individuals exploring complex issues. With innovations in communication and transportation, collaborators no longer need to be physically near each other. Science research teams (and their publications) often include the names of 50 or more scientists working on similar problems and sharing their results, even though they may reside continents apart.

In 1989, as I prepared the Preface for the first *Handbook of Research on Teacher Education*, I expressed concern about the extensiveness and quality of research in the field. Teachers had little research to guide their actions, making most decisions on the basis of how they were taught, what they found in textbooks, and what their colleagues were doing. At every educational level, too many decisions were being made on the basis of personal experiences, too little on comprehensive research conducted about relevant and important issues, and too few educators were committed to building a solid research foundation. Some progress has been made in the intervening years, but the preponderance of decisions are still not informed by dependable evidence.

Educators and researchers face daunting challenges when they try to base their research and practice on previous findings and conclusions and methodology. The easy availability of literature on the internet and in the thousands of local journals, monographs, and private publications without controls imposed by careful editors, has intensified the problem. As a result, too many published studies have been poorly conceived, inconsequential, unimaginative, insignificant, and simply mirror their author’s biases rather than contributing to sound research. The uneven quality of educational literature requires each researcher to assess the validity and relevance of sources before basing processes and hypotheses on them. Winnowing out valid studies so that education can become a progressing field becomes vital to relevant education in an increasingly changing twenty-first century.

**The Handbook of Research on Teacher Education**

The *Handbook of Research on Teacher Education* was initiated to ferment change in education based on solid evidence. The first Handbook was conceptualized twenty years ago in February 1987 and published three years later, thanks to the prodigious work of committed educators. I was privileged to serve as Editor and to work with two talented Associate Editors, Martin Haberman and John Sikula. Six years later the Second Handbook was published with John Sikula as Editor and Thomas Buttery and Edith Guyton as Associate Editors.

Editors and their Editorial Boards of these two handbooks examined current educational literature and invited educators who were conducting sound research and providing leadership to serve as chapter authors. The purpose was to synthesize current research findings, interpret and critique them, delete questionable findings, and provide a sound basis for further explorations. In addition to the editors of the first two handbooks and their editorial boards and advisory committees, 160 coauthors contributed their expertise to the ninety-six chapters that analyzed and summarized educational research.

The two volumes organized teacher education into recognizable sections and chapters that mirrored teacher preparation and professional development. The second handbook built on the first. Several fields seemed to require more extensive exploration or had undergone rapid change in the previous six years. The two handbooks, while formatted in similar ways, complemented each other by focusing on different areas.

Just as the world environment and education have changed since the last Handbook was published ten years ago, so too have the needs for research handbooks. Since the
second Handbook was published, more than a dozen reviews of research in different fields of education have been published, including the work of AERA's Panel on Research and Teacher Education, *Studying Teacher Education*, edited by Marilyn Cochran-Smith and Kenneth M. Zeichner (2005).

The third Handbook is organized in a different way from the first two volumes to reflect the needs of educators today. In its developmental stages, the third Handbook was often referred to as the “unhandbook” to denote its unique approach to achieving the same purpose. The Editors and the Editorial Board believed that only a new approach would meet the needs of researchers and practitioners today.

The third Handbook is organized around nine sections. Each section includes an introduction and three types of documents: framing chapters by distinguished researchers, commentaries that provide different perspectives on the central issue, and artifacts—documents, treatises and articles that have formed the basic fabric of teacher education over the past century. The combination of thoughtful essays and equally thoughtful commentaries complemented by careful attention to historically significant documents provides a balance and perspective that enhances the inquiry into teacher education. As I read the chapters, commentaries, and artifacts in the third Handbook, I was impressed by the perspectives gained from the volume. What the editors and authors have accomplished is to put research in context, apply research findings to relevant current issues, and draw on influential documents and current scholarship.

The profession and the Association of Teacher Educators are indebted to the four editors of the *Handbook of Teacher Education*, Third Edition, Marilyn Cochran-Smith, Kelly Demers, Sharon Feiman-Nemser, and John McIntyre, who have devoted extensive time over the past four years to bring together a volume that provides the base for improved education and educational research. They have introduced major changes in the format of the Handbook. And the new organization brings the best of education’s historical roots through artifacts combined with fresh insights into teacher education’s most vexing challenges, and commentaries on chapters that broaden the research perspectives. The leadership of the four co-editors as well as the contributions of the exceptional authors and commentators emulate the finest in professional service and scholarship. More than 70 distinguished educators and researchers have contributed to the Handbook of Research on Teacher Education, Third Edition which also contains over 30 historically significant artifacts. To each of them we as a profession owe a deep sense of gratitude for their vision, diligence, and contributions to education.

W. Robert Houston
John and Rebecca Moores Professor of Education
University of Houston
Editor, *Handbook of Research on Teacher Education*, First Edition
Preface

The growing consensus that teachers matter is not matched by a growing consensus that teacher education matters. In fact, the value of teacher education remains as contested today as it was in the era of the normal school. And yet, given the importance of education in our global society, one could surely make the case that the education of teachers is indispensable in shaping the quality of life for individual learners, for communities, for our nation, and for the world.

This *Handbook of Research on Teacher Education* appears at a volatile time in the history of the field. Alternative pathways into teaching have proliferated. Accreditation is no longer the monopoly of a single organization. The accountability movement drives reform initiatives at every level of the educational system. There is a renewed confidence in the power of scientific research to solve social and educational problems. Yet the achievement gap between majority and minority students persists. As the subtitle of this Handbook suggests, the fundamental issues facing teacher education are not new. They have persisted over time despite economic, political, and social changes.

One reason why these issues endure is that teacher education is a value-driven enterprise. A central purpose of this Handbook is to help readers sort out which of the enduring issues is primarily values-based and cannot be settled by science alone and which of the issues depends on empirical study. For example, empirical research can tell us who is going into teaching and what teachers actually learn in teacher preparation, but research alone cannot determine who is qualified to teach. Decisions about teacher quality and qualifications depend on beliefs about what good teaching entails and these beliefs ultimately derive from what we value most in teachers. Since people have different views about what makes a good teacher, they will hold different expectations about what teachers should know, care about, be able to do. Hopefully this Handbook will help readers appreciate the power and limits of “science” in addressing some of the normative issues that confront teacher education.

A second purpose of the Handbook is to help the diverse community of teacher educators connect their own work to contemporary conceptual and empirical scholarship and to historicize our collective understanding of teacher education. In order to generate new knowledge and build a dependable foundation for policy and practice, teacher educators need to understand how others have framed and investigated the issues and problems they face and how their own experiences and insights relate to existing knowledge. Not every teacher educator needs to do original research, but anyone who aspires to be a professional teacher educator needs to stay abreast of new developments in the field and read research with a critical eye.

A third and related purpose is to challenge conventional thinking and practice and disturb the status quo not by polarizing issues or ignoring problems, but by presenting evidence, arguments and diverse perspectives in critical, clear-minded ways. Hopefully
this Handbook will help advocates, critics and skeptics consider what we do well and where we fail, what we agree on and where we legitimately disagree, what dependable evidence exists and where opinion and ideology cloud our thinking.

This Handbook is addressed to the growing community of practitioners, researchers and policy makers involved or interested in the education of quality teachers. This includes teacher educators and other faculty who teach teachers in universities, colleges and community colleges as well as those involved in alternate route recruitment programs like Teach for America, alternative preparation programs recognized by state agencies, distance-based teacher preparation curriculum, for-profit providers of teacher training, school-based administrators and teachers who participate in a variety of teacher education and induction programs and policy makers who formulate and enact policy at multiple levels. We target this mixed audience because we believe that, in teacher education, research, policy and practice are intertwined. We also hope that the volume or at least sections will be useful to observers, skeptics and critics of teacher education.

When the leadership of the Association of Teacher Educators invited us to co-edit the third Handbook of Research on Teaching, we were skeptical about the need for another conventional handbook. Since 2000, there had been a steady stream of commission reports, blue ribbon panels, research syntheses, report cards, manifestos and white papers on teacher quality and teacher preparation. In addition, two major research reviews were in the works. The American Educational Research Association (Cochran-Smith and Zeichner, 2005) had commissioned an analysis of empirical evidence regarding key policies and practices in preservice teacher education with the goal of generating a new research agenda. The National Academy of Education through its Committee on Teacher Education (Darling-Hammond and Bransford, 2005) was preparing a major synthesis of research on teaching, learning, teacher education and teacher learning in order to develop recommendations for the curriculum of teacher education.

Instead of going forward with a conventional handbook, we conceived of what we informally call the “unhandbook.” Rather than conceptualize the broad landscape of teacher education and commission comprehensive reviews of the latest research for major domains of practice and inquiry as is usually the case with something called a “handbook,” we took a different tack. We wanted to stimulate a broad conversation about foundational issues, bring multiple perspectives to bear, including historical perspectives, provide new specificity to topics that have been undifferentiated in the past, and include diverse voices in the conversation. Taking all these aspirations into account, we conceptualized a unique “unhandbook” with a thematic focus and distinctive structure.

With the help of an Advisory Board who met in Boston in 2003, we identified nine foundational issues in teacher education. To bring these issues to life, we translated them into set of focal questions, for example, What’s the point? Who’s in charge? Who should teach? How do people learn to teach? Does difference make a difference? How do we know what we know? We organized the volume around the nine issues with a common structure for each of the sections.

Each section includes an introduction, a set of framing chapters, a collection of artifacts and some commentaries. The introduction, written by the section editor, explains why the core issue has persisted, how it has been conceptualized over time, and why the particular framing chapters, artifacts and commentators were chosen for the section. The framing chapters focus on different dimensions or facets of the issue as well as different ways of thinking about it. These chapters offer a more nuanced discussion than is usually possible with a single, comprehensive research review. For instance, in the section on diversity, one chapter considers the preparation of white teachers to teach diverse students, while a second chapter deals with the preparation needs of minority teachers. The
framing chapters are followed by a set of artifacts, historical and contemporary documents that demonstrate the enduring nature of the issue and illustrate how it has been conceptualized or debated over time. Many are classics in teacher education and they contribute to the unique character of the Handbook. Each section concludes with two or three commentaries written by researchers, teachers, teacher educators, policy makers and/or foundation directors representing diverse perspectives.

Each section was developed by a member of the Advisory Board who took responsibility for conceptualizing the issue, inviting authors of framing chapters and commentators, selecting artifacts and writing the introduction. Some sections, like the one on accreditation or the demographics of the teaching force, are more self contained; others deal with cross-cutting themes. For example, the issue of diversity receives a fresh treatment in its own section but also permeates the entire book. The section on the purposes of teacher education is a first. No previous handbook of research on teacher education has dealt with this enduring and foundational topic.

Over eighty authors, ranging from established scholars and teacher education leaders to emerging researchers and new entrants to the field, have contributed to this volume. The Handbook contains a wealth of artifacts spanning two centuries and offering rich and varied evidence that the central concerns in teacher education have persisted although they have been understood in different ways at different times. The commentators reflect a wide spectrum of political and ideological stances. We deliberately sought out thoughtful people with divergent views on teaching and teacher education to provoke critical thinking and stimulate engagement with fundamental questions about teacher education.

No Handbook is meant to be read cover to cover, and we fully expect that readers of this Handbook will be drawn to different sections. We hope that they will be stimulated and stretched by the opportunity to think about fundamental issues from multiple perspectives, to gain historic perspective and conceptual clarity, to consider where dependable evidence exists and where belief and ideology cloud thinking. Ultimately we hope this Handbook will contribute to more informed and equitable practice and policy in teacher education and move the field toward more rigorous and relevant research.
Acknowledgments

As with any project of the size of this Handbook, this project could never have been completed without the assistance of many people. We are grateful to all of them. The editors especially want to acknowledge the members of the Handbook Advisory Board who helped to conceptualize this handbook and offered excellent advice about enduring issues in teacher education. Many of the board members eventually became section editors, chapter authors, and commentators for this volume. As the editors of this volume, we want to acknowledge their efforts: Renée Clift (University of Illinois), Carl Grant (University of Wisconsin), David Hansen (Teachers College), Andy Hargreaves (Boston College), Bob Houston (University of Houston), David Imig (AACTE), Mary Kennedy (Michigan State University), Susan Moore-Johnson (Harvard University), Sonia Nieto (University of Massachusetts), Ed Pultorak (Southern Illinois University), and Ken Zeichner (University of Wisconsin). We also want to thank Renée Clift, in particular, who served on ATE’s Research Committee, and was instrumental in encouraging us and ATE to take on the editorship of this volume. We also want to thank Bob Houston, Editor of the first *Handbook of Research on Teacher Education*, who provided a valuable historical perspective on this project and graciously agreed to write the volume’s Foreword. Finally, we would like to thank Allen Warner (University of Houston) who was ATE president when the third edition was proposed and was influential in the original contacts with our publisher.

There is no way this project would ever have been completed without the thoughtful, always positive, and tireless efforts of Kelly Demers, who began to work on this project as a graduate student assisting in the organization of the board meeting. Over time, Kelly became the manager of the project and eventually Associate Editor of this volume. She also served as co-editor of one of the volume’s major sections. Kelly worked with the editors to conceptualize the volume and its many chapters. She kept all of the contributors to the volume organized and on track. There were 83 authors in total, so this was no small task. She handled all of the administration, logistics and permissions related to the project over four years. Her efforts were absolutely indispensable, and her pleasant diplomacy and consistent grace under the most trying circumstances were inspiring. Her contributions to the project and to this volume are immense.

We are also grateful to the many graduate students who assisted faculty members in their preparation of chapters and commentaries. In particular, we want to thank Ann Marie Gleeson, a doctoral student at Boston College, who worked on the formatting of the chapters in this volume; her attention to detail was invaluable.

Finally, we would like to acknowledge the editorial assistance and overall encouragement and support of Naomi Silverman, who worked with us on this project from the beginning. Her unfailing positive attitude and her enthusiasm for the project sustained us.

Part 1

What’s the point?
The purposes of teacher education

Editor: David T. Hansen
Part 1

Framing chapters
1 Introduction

Why educate teachers?

David T. Hansen
Teachers College, Columbia University

Every philosophy of teacher education presupposes underlying assumptions about teaching and education. These assumptions are not easy to keep in view. As every seasoned teacher educator can attest, the work is all-encompassing, sometimes exhaustively so. The press of time, of building programs, of dealing with bureaucracies, of endless meetings with collaborators, of countless hours with candidates, of getting from one school to another, of applying for grants, and more, can make philosophical reflection seem like a remote luxury, perhaps for sabbatical or a weekend retreat. Moreover, the politicized environment surrounding teacher education generates anxiety, anger, distraction, and confusion. The environment places relentless pressure on teacher educators to showcase and defend their work, however experimental and in transition it may properly be (because dedicated teacher educators, like good teachers everywhere, are constantly seeking to improve their work, it often has an experimental character). This pressure can lead teacher educators to dig in their heels and dogmatically cling to particular values and aims, rather than to subject them to ongoing criticism and judgment. All of these factors militate against calm, tenacious, and honest reflection on purpose.

Even in settled moments it is not easy to return to one’s philosophical starting points. And yet, this kind of inquiry can be a source of immense intellectual satisfaction and personal growth. On the one hand, it can trigger fresh, revitalized thinking for programs, policies, and practices. On the other hand, it can spin out new and stronger threads for the fabric of one’s work as a teacher educator. The effort to philosophize makes it possible to articulate why teacher education is worthwhile. It positions teacher educators to gauge whether their views and values have matured over time. Such inquiry makes it possible to consider alternative outlooks, an experience that in itself can have significant consequences for educational thought and action.

The goal of this section of the handbook is to undertake an intellectual excavation. The authors of the chapters that follow identify bedrock values that underlie the stated purposes of teacher education most prominently in circulation today. The authors also describe additional values, outlooks, and programmatic approaches that might be of service to teacher educators as they ponder their reasons for being. All three authors are philosophers of education who have played sometimes intensive roles in the practical work of teacher education. As they elucidate concepts and ideas, they aspire to be critical, clear, and analytic. Their concerns and values will be apparent, even as they seek to keep open to question their own assumptions and those that characterize the current ethos in teacher education.

In Chapter 2, I discuss the educational values of (1) preparation for productive life, (2) academic learning, (3) human development, and (4) social justice, with the latter sometimes associated with multiculturalism, at others with civic and democratic education. I identify core meanings that advocates perceive in these values, and I raise questions
about them. To provide philosophical assistance in criticizing them, I sketch two alternative standpoints for assessing the purposes of teacher education. They are what can be called “public interest” and “the cultivation of personhood” (or individuality). The chapter concludes with suggestions on how to sustain a critical dialogue about purpose in a climate where, to many, the issue has long been settled in favor of one value or another. Because no previous handbook of research on teacher education has addressed the question of purpose in a direct or systematic way, I write in the form of an essay, hoping to sketch perspectives that can propel future reflection and research.

Emily Robertson, in Chapter 3, examines the relation between teacher education and democracy. She takes as her context several interlocking circumstances: the evident decline in democratic participation in the United States, pressures to standardize curriculum and teaching through broad testing schemes, questions about the worthiness of schools of education to house teacher education, growing interest in civic education on the part of higher education institutions, and what she and many critics characterize as a polarized political and educational discourse in the nation. She asks: What dispositions and abilities can strengthen a genuinely democratic way of life? What roles can education, including teacher education, play in developing them? In response, Robertson focuses on how schools can assist the young to develop the arts of deliberation, negotiation, and activism in the name of justice and freedom. She addresses how teacher education can help new teachers grasp and teach these arts. (These tools can also be useful to teacher educators themselves as they debate purpose and substance in their programs.) Robertson concludes that schools of education can prepare good teachers capable of fulfilling this democratic purpose only if they sustain meaningful autonomy from centers of societal power, which might otherwise coopt teacher preparation in pursuit of their own particular ends.

In Chapter 4, Hugh Sockett describes four models of the epistemic and moral purposes of teacher education. Sockett takes as a point of departure conceptions of a profession, and raises questions about the appropriateness and likelihood of school-teaching becoming a full-blown profession. He examines the often conflicting claims about the knowledge base in teacher education. With this discussion in hand, Sockett elucidates four models of teacher preparation which he calls (1) the scholar-professional, (2) the nurturer-professional, (3) the clinician-professional, and (4) the moral agent-professional. Each harbors a distinctive moral and epistemological standpoint, such that each, as he shows, is both a model of practice and a model for practice. Sockett deploys his analysis of the models to underscore the fact that diversity of outlook continues to prevail both within and outside the teacher education community. As such, debate about the purposes and substance of teacher education, rather than consensus, will likely continue far into the future.

The inclusion and structure of the three chapters mirrors the aims of this section of the handbook. I hope my lead-off chapter helps readers come to grips with their most fundamental beliefs and convictions, as well as their deepest doubts and questions, about the purposes of teacher education. Emily Robertson seeks to shed light on the thorny and urgent issue of the place of teacher education in a society that purports to be democratic. Hugh Sockett foregrounds the epistemological and moral aspects of teacher preparation not only because it is timely to do so given contemporary discourse on teacher education, but also to illuminate what it means to speak of teacher education rather than, say, merely job training as if teaching were a mode of rote skill work.

These core chapters are followed by four readings selected to provide an intellectual, aesthetic, and ethical backdrop to this section of the handbook. They are written by, respectively, Ralph Waldo Emerson, Jane Addams, W. E. B. Du Bois, and John Dewey.
From an intellectual point of view, the readings demonstrate that questions about the purposes of education have been around for a long time because they are unavoidable, challenging, and inviting. In aesthetic terms, the readings illuminate how shriveled and dry conceptions of education can become if they are divorced from what renders life beautiful and meaningful. The readings provide an ethical backdrop because virtually every sentence in them addresses the reader, asking her or him to confront questions about value and purpose in education. Put another way, the readings cannot be heard if approached solely through an historical or sociological lens. Those lenses categorize the texts before they have even been opened, putting them in their (or a) place rather than considering the fresh voice they provide if one seeks to listen.

In “The American Scholar,” an address at Harvard College given in 1837, Ralph Waldo Emerson fashions a provocative image of what it means to be an educator in a new society that has not yet “found” its identity (a condition that some might say continues to describe the United States). Such an educator takes seriously his or her mind and its powers to think, imagine, and question. For Emerson, this posture is requisite for taking seriously the minds of others. An educator does not pre-judge self or others, but rather arrives at or reaches a judgment after inquiry, reflection, and communication. The teacher and scholar also is a person immersed in the richest curriculum available, which constantly pushes him or her to expand horizons and perspectives. Emerson illustrates his argument by spotlighting reading. He contends that reading should constitute not merely the acquisition of information but should also be a formative experience in its own right. Reading should show the teacher and scholar the tremendous range and depth of human accomplishment across time, even as it demonstrates the many challenges in living. As a consequence, reading should compel the teacher and scholar onward, and outward, to realize as fully as possible his or her unique talents and bent. This experience positions the individual to assist others in what Emerson regards as the great and boundless human adventure of education. For Emerson, education should support every person’s entry to a life of purpose and meaning rather than to one of subservience, whether the latter be to a class, a geographic region, an idea, or an idol.

W. E. B. Du Bois’s tale, “Of the Coming of John,” published in 1903 in his The Souls of Black Folk, is at once a story of the costs of racism and of the dangers of education. A young black man, John, leaves his southern town to obtain an education in the north. After nearly failing because of youthful frivolity, he reverses course and succeeds brilliantly as a student. The consequences are both beautiful and devastating. On the one hand, John perceives how miraculous and magnificent are the accomplishments of humanity in realms such as art, science, and literature. He has an Emersonian insight into his own unfathomable potential to create and be a purposive being. On the other hand, he also sees how unjust his society has become under the pressure of racism and its associated social, political, economic, and educational inequities. At one and the same time, John experiences inexpressible joy and indescribable despair. His newly won vision is dangerous both to a racist social order and to his own community’s self-containment, and he becomes a foreigner to both. In between the lines of this story, Du Bois seconds Emerson’s call for an education in meaning for all persons, and also indicates that political, economic, and social change must accompany such a call for it to become a reality. At the same time, Du Bois leaves on the table the idea that genuine education will generate confusion, doubt, and suffering as much as their opposites. He asks, in effect, whether teachers (and their teachers) can accept this condition or whether they will seek safety and consolation by adopting a one-sided view of what is entailed in becoming educated.

Jane Addams advances a complementary view in her essay, “Socialized Education,” published in 1910 in her book about the settlement house movement, Twenty Years at
Hull-House. Addams’ view of education fuses the values of individual development and community enrichment. She and her colleagues treat every immigrant who crosses the threshold of the settlement house as a unique, unprecedented being, but also as a person who can go on to share his or her educational experiences with others. It becomes an informally understood obligation for residents and immigrants alike that to receive positions one to give. Through a myriad of examples in this essay and throughout her book, Addams describes an education in and for the arts of communication and meaningful interaction with other people. “Socialized education” points to a merger of academic, trade, and civic education, as the immigrant children and adults participate in the comprehensive programs she and her colleagues tirelessly create and reconstruct. But the term suggests more than this, as a brief analogy with an idea from John Dewey will illustrate. Dewey highlights the need to “psychologize” subject matter if the young are to grasp its logic. They cannot immediately perceive knowledge in the same way an experienced scholar or teacher does. Knowledge must first be connected with their experience (see Chapter 2 in this section). On her part, Addams emphasizes the need to “socialize” the subject matter of both school and life in order to render it into something other than merely a personal possession. She grants a necessary space for solitude and private self-cultivation. But their fruitfulness is immensely enriched through a generous social and public life (and vice versa), however modest in scale it may be.

In the final selection, on “The Need for a Philosophy of Education” published in 1934, Dewey argues that in a rapidly changing world educators must be ever vigilant and ever articulate about their aims and methods. They must wed flexibility with principle, adaptability with conviction, and experimentation with commitment. A democratic way of life calls for these and associated dispositions precisely because such a life refuses to predetermine peoples’ destinies. For Dewey, education in modern times carries a special burden: to make available to all children and youth, on a regular basis, genuine educational opportunities. This unending task requires both excellent preparation of educators and consistent social, economic, and political support from society. At the same time, in accepting this burden educators experience a special democratic grace. More than most other groups and individuals in society, they have the privileged opportunity to engage in a systematic educational relationship with children, youth, adults, and their peers. They can bear witness to democratic transformation every day, if by “transformation” is meant the expansion and enrichment of communication between people however small in scale when compared to the social whole.

These cursory summaries illustrate why the readings remain fresh even as their influence has percolated through culture up to the present moment. They challenge the dominance of theory in approaches to reading, whether of books, persons, or events. The four figures would understand the claim that each of them could be read historically, as subject to particular influences, pressures, values, precedents, and so forth that in an a priori fashion are taken to determine the boundaries of thought and expressivity. They would understand the notion that each could be read as the embodiment of a particular gendered, raced, classed, and otherwise sociologically bounded standpoint or location. In a marvelous way, however, the four figures question the privileging of any perspective that presumes to hold “the key” to “the right way” to read the world. Through a variety of tropes and viewpoints, they dramatize the question of what degrees of freedom human beings enjoy to be creative in the very midst of psychological and social pushes and pulls. These and other factors account for why their work remains young, and for why it provides an appropriate backdrop for a fundamental inquiry into the purposes of teacher education. (For a detailed and closely related examination of the readings as a set, see Hansen et al., in press.)
The concluding portion of Part 1 of the handbook features commentaries by Michael Apple, John Goodlad, and Vanessa Siddle Walker. As editor, I invited them to serve as commentators because of their lengthy and varied experience as scholars, and because of their long-standing concern for education. Apple has examined ways in which the structures and ideologies of a capitalist political economy interface with the workings of the educational system. Goodlad has undertaken extensive studies of the functioning of teaching, schooling, and teacher education. Walker has researched in depth the education of blacks during the historical period of de jure segregation in the United States. In asking these scholars to comment, I also believed they would offer contrasting perspectives on the question of purpose in teacher education. They have fulfilled that expectation.

The core chapters, reading selections, and commentaries underscore the idea that education is a value-laden endeavor. Every curriculum and every mode of instruction embodies a judgment that this is important to learn and this is the way to teach it. This expression of judgment holds for the most advanced doctoral study and it holds for the most bare-bones job preparation program. The unavoidable presence of values in all educational work thus raises the question of which values ought to be given priority in a given system. In turn, this question illuminates why all genuinely educational purposes are bound to spark tension and controversy, precisely because they rest upon values that may not be shared or prioritized by others.

These points hold for the purposes of teacher education. As this section of the handbook demonstrates, there is significant disagreement among teacher educators, teachers, administrators, policy-makers, researchers, and others regarding the purposes of teacher preparation. Some critics would do away with formal preparation entirely, while others advocate for rigorous training programs modeled after those in law and medical schools. In between these endpoints are a host of perspectives that regard teacher education as a mode of socializing new candidates into an occupation, or as a means of inducting them into a profession, or as a vehicle for initiating them into a social and moral vocation. Taken as a whole, this section provides one way to sketch the contemporary debate about purpose and prospect in teacher education. Hopefully, it will be useful to all who aspire to greater clarity about purpose and to a greater sense of agency in participating in the ongoing debate.

REFERENCES

Values and purpose in teacher education

David T. Hansen
Teachers College, Columbia University

To ask what the purposes of teacher education are is to presume such an education is necessary. However, from the time that schools for children and youth emerged on a wide scale in the nineteenth and twentieth centuries, many critics have asserted teachers do not require formal, professional preparation. They need to know the basics of the subjects they teach, how to keep order in the classroom, how to get along with people, and how to abide by administrative regulations. An adequate secondary and college education, so the argument goes, will give them the requisite subject matter knowledge. Experience will teach them how to organize the classroom and cooperate with institutional authority. This familiar point of view goes hand-in-hand with the idea that schools exist to socialize the young to fit into society. Since teachers have themselves been socialized in this system, they do not need any distinctive background or preparation for the work. In this outlook, the idea of formal teacher preparation makes no more sense then instituting a “socialization preparation program” for teacher candidates.

To talk about the purposes of teacher education is also to presume such an education is worthwhile, that it makes a difference in how teachers conduct themselves and in the influence they have on children and youth. However, since the beginning of widespread schooling around the globe many critics have asserted that teachers are basically technicians serving the interests of those with economic and political power. Despite their good intentions and best efforts, so the argument goes, teachers labor in highly constrained circumstances that undermine the possibility of meaningful education. Their factory-like schools embody hierarchical economic, social, and class structures characteristic of the larger society. Their work is subject to constant bureaucratic and administrative control, itself shaped by the same societal forces and conditions. Writing from the perspective of the 1960s, Harry Braverman captured the spiritual consequences of what he and other critics regarded as a lockstep system:

. . . [T]here is no longer any place for the young in this society other than school. Serving to fill a vacuum, schools have themselves become that vacuum, increasingly emptied of content and reduced to little more than their own form. Just as in the labor process, where the more there is to know the less the worker need know, in the schools the mass of future workers attend the more there is to learn, the less reason there is for teachers to teach and students to learn. In this more than in any other single factor—the purposelessness, futility, and empty forms of the educational system—we have the source of the growing antagonism between the young and their schools which threatens to tear the schools apart.

(1974, p. 440)

Given this picture of the world, formal teacher education can be seen as a waste of time,
if not a cruel hoax perpetrated on unsuspecting young candidates about to run into a wall.

These long-standing viewpoints differ in their fundamental assumptions about education and society. The one sees schools as benign agents of social continuity, the other as an embodiment of social ills. They share the presupposition that formal education, including the education of future teachers, must be understood through a functionalist lens.

In this chapter, I will argue that there remain good reasons for talking about the purposes rather than solely the functions of teacher education. Purpose and function are not synonyms. As Dorothy Emmet (1958) has shown, function supports maintenance while purpose mirrors creativity. Maintenance and creativity are both indispensable to society, though they may co-exist uneasily. To conceive education in functional terms presumes that the terms of the work are not set by its practitioners but rather by larger societal forces. There is truth in this outlook. Broad social, economic, political, cultural, and other forces will always influence educational practice, as well they should. A permanent aim of schooling in any society is renewal and continuity, without which the society would simply collapse. Even in the most democratically constituted community, teachers will always undertake important functions that differ from the functions of other societal actors (for example, lawyers and judges who preserve law, airline pilots who make the air fleets run, garbage collectors who keep towns and cities clean).

However, my premise in this chapter is that there can be significant consequences when educators ask What do we want to do, and how are we going to do it? The consequences may affect a single student, a classroom, a school, a district, or a larger entity, even a nation. If a “purpose” is understood as something envisaged that is to be brought about through human creativity, then it remains legitimate, coherent, and necessary to speak of the purposes rather than merely the functions of teacher education.

Put another way, there are excellent reasons for talking about education rather than presuming human conduct reduces to preset modes of formation. For one thing, even an insightful (and anguished) critic like Braverman acknowledges in the very act of his writing that it is important to strive for societal improvement. For another thing, the very existence of multiple and incommensurable theories of social determinism—consider the ways in which Karl Marx, Sigmund Freud, and Michel Foucault have been appropriated—calls one to look again at human possibilities and prospects. Moreover, the unpredictable and the uncanny continue to emerge in human affairs, sundering time and again theoretical attempts to categorize or pin them down. A few thousand votes out of tens of millions in 2000 would have altered the outcome of the presidential election in the United States. Would a President Gore have advanced the same educational agenda as President Bush, embodied, for example, in the No Child Left Behind legislation passed in 2001?

Education as compared with functionalist reproduction continues to happen whenever teachers and students ask meaningful questions, share their interpretations and arguments surrounding subject matter, conceive and complete projects, and cultivate their individual talents and bents. Such happenings take place countless times even in large, bureaucratic schools. They happen all the more frequently in schools with thoughtful administrators, dedicated teachers, imaginative curricula, engaged parents, and structures conceived experimentally that range from block scheduling, to regular faculty meetings, to “schools within schools” that can support meaningful teaching and learning. These points do not obviate genuine concerns about today’s schools. But they do call into question overarching claims about “the way education is.”

Furthermore, as both teacher testimonials and systematic research have demonstrated
(see, for example, Connelly et al., in press, and Richardson, 2001), to enact what it means to be a successful teacher requires ongoing teacher education understood in both its formal and informal senses. Any serious reader of this literature, it seems to me, cannot help but perceive how complicated the work is. In no particular order, teachers need to consider (1) the psychological, social, and cultural aspects of students’ learning and conduct, (2) the logical and substantive aspects of subject matter, (3) the social, moral, intellectual, even aesthetic dimensions of interaction in classrooms and schools, and (4) the politics of parent–teacher, teacher–administrator, and teacher–teacher relations in the school setting. And there is more. Teachers need to cultivate an articulate perspective on today’s rapidly changing world with its economic, social, technological, and environmental problems and prospects. They need this outlook because the young will invariably look to them for structures of meaning and significance in response to the often stark transformations they hear about (and perhaps experience). Unless teachers cultivate a sense of purpose allied with a feeling for the larger human affairs of our time, they may themselves feel solely like functionaries. This call does not imply they must become philosophers, theorists, or public intellectuals. Rather, it means appreciating why they teach, why their subjects are important, and why it matters to pay attention to students, parents, colleagues, and others involved in the educational process.

Given this portrait of the complexity of teaching and human life today, I believe teacher education remains both necessary and worthwhile. It is also highly complex in its own right. Most teacher educators concur that a college degree is insufficient to render a person a successful teacher, just as a degree does not automatically make a person a successful doctor, businesswoman, policeman, or botanist. The complexities in teaching, which themselves evolve alongside the changing complexity of society, demand ongoing teacher education in both its formal and informal senses. However, teacher educators, teachers, school administrators, policy-makers, researchers, and others disagree about what constitutes the best education for teachers. These differences mirror contrasting values regarding the purpose of education, and thus of the education that teachers need—and, one might add, deserve—to perform their work well.

In the first section of this chapter, I will touch on what I take to be some of the most widely lauded values people perceive in education. I will address the consequences of these values for teacher education. The subsequent two sections provide alternative standpoints for assessing the purposes of teacher education. The first is what can be called “public interest,” and the second can be called “the cultivation of personhood” (or individuality). These alternatives are not incompatible with one another nor with the values outlined in the first section. However, they generate a larger backdrop or horizon for discussion than what any single conception of teacher education on the table today can provide. In the concluding section of the chapter, I address the vexing but unavoidable question of how the educational community, in interaction with other sectors of society, can sustain a dialogue about purpose in the very midst of strident claims that this issue has been settled.

A SKETCH OF THE CURRENT VALUES LANDSCAPE IN TEACHER EDUCATION

Among the most prominent values influencing the scope and structure of teacher education programs today are preparation for work and life, academic learning, human development, and social justice, with the latter cast in some cases as respect for cultural diversity or multicultural education, and in others as civic or democratic education. For
heuristic purposes, I will address each of these values separately. However, in actual practice they often overlap and even fuse.

From the very inception of schooling many educators and members of the public have understood its primary purpose to be the preparation of the young for economic and social life. This widely held value exerts continuous pressure on teacher education programs. It does so because many parents conceive this value first and last when they think of their children’s education, even while they may differ radically from one another with regards to political, cultural, or religious values. Moreover, the idea of preparation for the future endures because few educators would claim that schools should play no role whatsoever in readying the young for adult life. Quite the contrary, this value may be the most widely shared among teacher educators. The differences between them boil down to how they conceive enacting it. Many believe this value should be seen as immanent, as a natural or constitutive outcome of a good education rather than as an explicit force driving program structures and content.

For example, teacher educators who esteem the values in academic subjects believe that excellent teaching equips the young with the knowledge and intellectual skills to confront the challenges of adulthood. Often associated with a particular subject such as art, English, mathematics, history, or science, these teacher educators believe their programs should cultivate candidates’ disciplinary knowledge in conjunction with instructional knowledge about how to bring subject matter to life. They take seriously, if not in so many words, John Dewey’s (1976) distinction between the logical and psychological aspects of a discipline. Logic points to methods of inquiring and thinking that form the structure of a field of knowledge. These methods are the bread and butter of scholars and experienced teachers in the field. However, Dewey argues that in a teaching and learning environment this material must be psychologized if students are to move beyond mindless memorization into genuine understanding. When they first encounter a new domain of knowledge, students cannot immediately grasp the logic which scholars have at their command. Consequently, the teacher’s charge, at whatever level of the system, is to generate activities that engage students’ powers to understand, explain, and come to grips with the significance of new academic knowledge. Teacher educators who heed this outlook draw upon, or produce themselves, research that illuminates ways to deepen candidates’ academic strengths and related pedagogical ability. Some take their point of departure from a sense that academic disciplines constitute beautiful, ever-evolving human achievements, and that it constitutes an injustice not to initiate the young into their mind-expanding and enriching values.

Other teacher educators esteem first and foremost particular conceptions of learning and the values associated with them. For example, some teacher education programs seek to enact a constructivist perspective, in which academic learning is highly prized and yet premised centrally on notions of the learner’s agency, initiative, and imagination. Other teacher educators highlight multiple intelligence theory, with its pantheon of ways of knowing the world (artistic, mathematical, etc.). Still others turn to Maria Montessori, Jean Piaget, Lev Vygotsky, and others who have articulated highly detailed accounts of human development. In a deep and perhaps inexpressible sense (save by poets), these teacher educators are often inspired by the sheer fact that human beings can indeed learn and grow in remarkable, unfathomable ways. They are moved by the facts of human generativity and meaning-making.

Other teacher educators conceive social justice as the core value in the preparation of teachers. For many, this value emerges from a commitment to rectify, through teacher education and (hence) schooling, historic injustices in society based on racism, sexism, classism, homophobia, and other forms of systematic prejudice. These teacher educators
envision teacher preparation as a dynamic vehicle for equipping new generations of teachers to play a part in societal transformation. This value also springs, for others, from a desire to ensure that today’s immigrant children experience genuine education. These teacher educators look at the rapidly evolving cultural tapestry of the nation and call for teacher education and school programs that respond to the changing scene.

In some cases, the call for social justice materializes in a focus on cultural diversity as the guiding theme in everything from crafting lessons, to organizing the classroom, to assessment. The call also takes form in various models of multicultural education, which again becomes the orienting perspective for selecting curricula, pedagogical method, and so forth. Proponents of cultural diversity and multicultural education argue that such an education is necessary for the young to ready themselves for a changing and, according to this view, a better world. They do not necessarily marginalize the marvels of academic learning, the beauties of individual human development, or the need to be prepared to lead a productive life, even though they may not privilege these values. This posture mirrors the fact that those who esteem first and foremost academic learning, life preparation, or human development are not necessarily sideling issues of social justice. However, there are tensions (to which I will return) between these standpoints with their varying emphases on what is central in teacher preparation.

Other teacher educators translate social justice into a call for civic and democratic education. Proponents draw on a variety of political and social theorists to argue that a central purpose of schooling in a democracy is to equip the young with the skills, knowledge, and dispositions that can enable them to act as citizens, rather than, say, solely as producers and consumers in the economic system. Advocates share common ground with multiculturalists in the sense that schooling cannot be, in their view, merely a preparation for life in society as it is currently constituted. Their eyes are directly on what they envision as a better world for all. However, they argue that multiculturalism may become incoherent and fragmented without a democratic education that cultivates an abiding disposition among all citizens to engage others with different values, outlooks, backgrounds, and concerns. For those dedicated to this outlook, teacher education becomes a site for preparing teachers of all subjects to bring to their work the commitment and the know-how to infuse civic and democratic interaction into school life (see Chapter 3 by Emily Robertson in this section of the handbook). Moreover, proponents also conceive the purpose of teacher education as helping practitioners learn to extend their teaching outside the boundaries of the school, either through forms of what is called experiential learning or through establishing connections with local communities and agencies. These activities would flow from a desire to help students develop democratic attitudes and skills alongside their learning of academic subject matter.

For heuristic reasons, I have characterized these various purposes of teacher education as inhabiting distinct, clearly demarcated realms of theory and practice. However, according to both research and extensive testimonials, teacher educators often adopt and fuse particular aspects of them in constructing their programs. Put another way, it is hard to name a single teacher education program that endorses one of the purposes while systematically excluding the others. No doubt some programs have transformed these purposes into approaches for which the field lacks an adequate description or name. They may have done so because there are pressing questions to be asked about all the values undergirding teacher education that I have sketched here.

For example, those who value above all the idea of schooling as preparation for a productive life must confront the question of what kind of “productive life” they have in view. To pose the matter in provocative terms, is it a life of fitting into the current socioeconomic system, marked as it is by inequity along the lines of quality of work
(ranging from little to considerable autonomy and initiative), quality of compensation (including pecuniary and health benefits), and quality of housing and community well-being? Or is it a life that in its modest, local way offers a contrast to accepting inequity precisely because the person has had a school education that equips him or her with the outlook, skills, and dispositions to act creatively and imaginatively in the face of social problems?

Proponents of life preparation may have multiple responses to these questions. For example, they might argue that societal transformation—presuming there is agreement about this aim and its meaning—is the work of adults rather than of children, who need solid training in skills and know-how to develop their capacity to decide and act on life matters. More provocatively, advocates might argue that because teacher educators often strain to cultivate the right political and ethical outlook, they end up privileging the health of their consciences and the imprint of those consciences on their programs more than they attend to concrete realities facing today’s young. For proponents of life preparation, the goals of teacher preparation are specific and focused, at all points tied to equipping teachers with the ability to teach skills and information effectively.

Nonetheless, the question of what kind of life one has in view as the outcome of education always remains on the table, at least in a society that styles itself as democratic. Even libertarians need to argue, rather than merely assert, that it is democratic to leave the question entirely up to individuals.

Those who value first and last academic learning face not only comparable questions but also queries about the constitution and meaning of academic knowledge. Whose knowledge? is the first question they are likely to have hurled at them. What knowledge is of most worth, and who decides? Teacher educators in this camp can point to the evolution of disciplines and emphasize that much of what is in them arose in the face of political and cultural opposition. For example, the very existence of history as a field of study and teaching can be seen as a human project of critical understanding (as contrasted, say, with one of mute acquiescence to the status quo). A field of work and teaching such as art can be viewed as a human response to universal experiences of wonder, joy, suffering, and beauty. Teacher educators can juxtapose these insights with an argument that the issue of academic knowledge raises dynamic educational and philosophical questions that are not reducible to ideological standpoint. The very concept “ideology,” they might underscore, emerged from systematic inquiry and knowledge rather than vice versa.

However defensible these responses may or may not be, there remain contentious questions such as When and how should academic knowledge be introduced to students? How can teachers learn to work effectively with the distinction between the logical and the psychological aspects of knowledge? Why do academic disciplines so often seem to morph into “school knowledge”? Put in stronger terms, how can academic disciplines help but be watered down, fractured, and distorted given the realities of school structure, of complicated lives students lead, and so forth? Is the account of the values in academic learning too idealistic, on the one hand, and too isolated from social realities, on the other hand? Or can it withstand this criticism? Teacher educators who esteem various conceptions of human development face similar probing into the nature and consequences of their values.

The values of academic learning and human development reach back several millennia and are among the most enduring in the world’s educational community. However, teacher educators who support them will have to respond to the equally long-standing view of humans as fundamentally economic beings. Can they demonstrate that pursuing academic learning and human development accomplishes the aims of preparation for
productive life, only better so? Put another way, can a humanistic education that cul-
vates the mind, the hand, the heart, indeed the whole person, prepare people for the
concrete challenges of life? Or should schools focus tightly on training in skills and
practical know-how, and be staffed by teachers who function more like technicians than
educators acting on a sense of purpose?

Those who value social justice as the aim of teacher education can ponder what they
mean by justice. One way to do so is to ask why this value trumps or is preferable to
others such as freedom, peace, compassion, truth, and love, all of which have been
advanced for centuries as core values in education. It would also be productive to engage
contrasting views of justice that have emerged from human history and that continue to
influence contemporary debate. Finally, it would be valuable to question what it means
to put educational processes in the service of overtly political objectives, however estim-
able the latter may be. The mirror twin here is the first value touched on above, preparing
to lead a productive life. In that outlook, education takes its identity not from being an
end in its own right but rather from being merely a means to an end.

All teacher educators, regardless of their values, can bene-
fi

All teacher educators, regardless of their values, can benefit from being critical of their
views. However, for those who put forward democratic or multicultural education there
is an additional self-imposed responsibility (even if not recognized as such) to be clear,
articulate, and self-questioning precisely because they claim explicitly to be acting in the
very name of justice and democracy. To assert a claim to the moral high ground in debate
is no light matter. Can this claim be harmonized with an image of clearing new moral
ground? How would proponents respond to the critic Susan Sontag (2001) when she
states (thinking of writers): “Should we serve justice or truth? It has to be truth, in order
to serve a justice which is not yet.” Sontag does not mean that justice and truth cannot be
reconciled. She means that the idea of truth presupposes a commitment to inquiry into
values rather than solely advocacy on their behalf (see the second section below on public
interest).

Advocates of social justice, whether in the form of advancing cultural diversity, demo-
cratic education, or some combination thereof, can reply by underscoring the sheer lon-
gevity of inequity and inequality in society—literally, from before the founding of the
republic itself. They could argue that in a society that purports to be democratic, public
resources in the areas of health, housing, employment, community development, and so
forth must be redirected to equip all to realize the risky promise, or promising risk, of
reaching out for genuine education (see the third section below on cultivating person-
hood). Put another way, access by everyone to the adventure of education is not some-
thing that can be brought about by fiat or by philosophical argument. Proponents of
social justice would argue that this accomplishment will take long-term social dedication,
political will, and thoughtful policy, in conjunction with reconstructed teacher education
programs.

These and other responses do not mute the questions posed above nor others that have
become familiar in teacher education circles. For example, how might multicultural edu-
cation avoid essentializing cultural differences and therefore distorting our understand-
ing of both human community and the development of individuality? How can civic and
democratic education avoid predetermining the scope and substance of teaching and
curriculum? Such an undemocratic outcome would be ironic, to say the least, if one takes
the view that democracy’s deepest and most radical prospect is that it refuses to preset the
terms of the future, even while working tirelessly in the present to expand communication
and possibilities for all.

John Wilson (1975) urges his fellow educators to be clear “whether we are, at any
one time, seeking for what is educationally desirable or what is desirable on other
grounds—and the fact that we might want both, if we can get them, only makes it more important to keep the distinction clear in the first place. Effective compromises can only be made if we know what we are compromising between” (p. 45). Academic learning and preparation for work, human development and democracy, truth and justice—these are among the distinct values at play in the contemporary landscape of teacher education. Can they be harmonized and realized at one and the same time? Or are tradeoffs, compromises, and differences in what to emphasize endemic to teacher education, much as they appear to be in every other social practice that comes to mind? In the ensuing two sections, I portray a horizon broader than any single value addressed in this cursory review. This horizon does not in itself constitute a larger, encompassing value or purpose. Instead, it provides an additional philosophical lens, or handhold, that can be of use as the debates about purpose go on, as hopefully they will.

PUBLIC INTEREST AS A CRITERION FOR ASSESSING PURPOSE

In this section I build upon Dewey’s theory of public interest. I will emphasize the difference between interest, in the singular, and interests, in the plural, because the distinction between them resides at the heart of Dewey’s outlook and its consequences for criticizing the purposes of teacher education. Dewey puts forward what is at first glance a breathtaking ideal, and yet one that can in fact be embraced by every person in society although never in a complete or final way. It is an ideal according to which life in its everyday manifestations can constitute an ongoing education, in the fullest intellectual, aesthetic, and moral sense of that term. To elucidate this outlook, I will discuss what I take Dewey to mean by the trio of concepts public, interest, and public interest. Then, I turn to how his notion of public interest provides a useful backdrop against which to reconsider the purposes of teacher education outlined in the previous section.

Human beings are members of various groups and social entities. They are associated with families, neighborhoods, churches, synagogues, mosques, schools, political parties, clubs and other local organizations, etc. Contemporary society is saturated with such groupings, and people have a host of varied memberships in them. However, none of these groupings, either in their singularity or collectivity, constitute what Dewey calls a public. Rather, the public is an always emergent, always evolving entity. Dewey argues that a public comes into being when (1) the consequences of human activity in any particular group or association spill out beyond those local social boundaries and affect people elsewhere, and when (2) the affected people take note of these consequences and seek to respond to them.

The perception of consequences which are projected in important ways beyond the persons and associations directly concerned in them is the source of a public . . . The public consists of all those who are affected by the indirect consequences of transactions to such an extent that it is deemed necessary to have those consequences systematically cared for . . . Indirect, extensive, enduring and serious consequences of conjoint and interacting behavior call a public into existence having a common interest in controlling these consequences.

(Dewey, 1988, pp. 244–245, 314)

I understand Dewey to be suggesting that there is no such thing as a fixed or permanent public—unlike, say, various long-established associations and institutions—and nor is there any public at all if people remain enclosed within their various groupings. A public
only emerges when people are drawn outside their local spheres and seek to address the consequences of action that are affecting them all in one way or another. Put another way, a public comes into being when people act with one foot outside the boundaries of their particular interests, whether the latter be economic, moral, cultural, religious, artistic, political, or educational.

Here is where the distinction between interests, in the plural, and interest, in the singular, that can be found in Dewey’s work becomes useful. Interests in the plural are like possessions. I have my interests and you have yours. This social group has its interests, that one has others. People seek out those with similar interests. In politics, business, and elsewhere, various groups with comparable interests come together to advance them in the face of competing interests. This language is familiar and useful in understanding social and political life.

In contrast, Dewey deploys the term interest, in the singular, to denote an attitude, orientation, or disposition that is bound up in the completion of an activity. While interests denote discrete objects or possessions which people can name, interest constitutes a movement or process. In various writings Dewey reminds us that a core meaning of interest is that which stands between two otherwise distant entities, or between the beginning and completion of an undertaking. Thus, interest is not a starting point or precondition of activity, and nor is it an outcome per se. Interest is a transactive concept, capturing a process that resides neither in the head nor wholly outside the head. The concept points to a process that is always forward-looking, prospective, uncertain, and yet also potentially generative in meaning and consequence as persons seek to bring activity to fruition. As such, interest forms a key concept in Dewey’s overall view of human growth.

What happens if we fuse Dewey’s framing of the terms public and interest? For one thing, public interest differs substantively from anything that can be captured by the term interests. Public interest is not another name for just another, perhaps larger “interest group,” to use the well-known term. Moreover, public interest is something other than a summation of localized interests; it is not merely a sum of the parts. To put it another way, there is no such thing as “the” public interest in the sense in which individuals and various groupings and associations can point to their interests. Public interest, framed now as a single concept, denotes an attitude, disposition, orientation that both emerges from and is enacted by human beings seeking to bring activity to meaningful completion. In what kind of activity is public interest expressed? Precisely in that which is called out by the emergence of consequences whose reach and effects have spilled out beyond localized boundaries, and which are of moment to people from various groupings and associations.

Teaching and teacher education are practices whose consequences percolate throughout society, thereby giving rise to a public concerned with their substance, quality, and effects. This public exists alongside others called out by the consequences of action in other domains such as health and sport. (Thus, a person can participate in many publics, while also pursuing various localized interests.) The public concerned about teaching and teacher education is never fully determinable because it is dynamic. It is diffuse, diverse, ebbing and flowing in its activity. Its constituents are rarely in agreement because the consequences of teaching and teacher education affect people and their particular groupings differently, in perception if not in concrete result.

Can this public develop public interest understood as a responsive disposition, orientation, attitude toward others and their concerns? Posed differently, can this public enact interest that reaches outside or beyond its many localized interests? According to Dewey, the existence and cultivation of such interest depends upon communication and
education. At the conclusion of his *Democracy and Education* (1985), he describes what he regards as an ongoing, never fully achieved communicative and educational need: “Interest in learning from all the contacts of life is the essential moral interest” (p. 370). The idea of “learning from all the contacts of life” infuses a democratic aspect to interest. It does so because, according to Dewey, a democracy “is more than a form of government; it is primarily a mode of associated living, of conjoint communicated experience” (1985, p. 93). Democracy as a way of life, as an organic commitment to meaningful communication, necessitates interest in learning from all one’s contacts in life. Democracy can neither function nor expand if persons remain cocooned within their respective domains. Such a posture, in Dewey’s view, constitutes a refusal of the priceless opportunity to learn from others and is thus, inadvertently, a form of self-diminishment. He calls especially upon those with the greatest economic, cultural, and political power to recognize the many short- and long-term costs of their isolation.

Dewey argues that all people can be educated in an interest in learning from experience. If students are provided with sustained educational encouragement that incorporates quality academic materials in conjunction with interacting with diverse people and situations, they can learn to enact as a matter of course such an interest. They can learn to respond habitually not only to pleasurable and pleasing events, but equally so to challenging and thorny circumstances. They can learn to address new consequences, including those in which conflicting interests are at work. In other words, interest in the singular sense of a process of involvement can lead people to deal with the consequences of different interests when they meet head to head. Dewey calls this interest in learning from all the contacts of life “the essential moral interest” not because he subscribes to an a priori human essence, but because if this interest saturates peoples’ dispositions and attitudes it propels them into the public world, however localized it may be, in the very face of misunderstanding, miscommunication, disagreement, and conflict. The term “moral” captures the sense of commitment and concern implied in an interest in learning from all one’s contacts and encounters.

Dewey concludes *Democracy and Education* on this note because, for him, democracy implies much more than a set of institutional structures, important as they remain. Democracy presumes expansive forms of communication, interaction, and mutual regard constitutive of everyday life. In a democracy understood as “a mode of associated living, of conjoint communicated experience,” life metamorphoses into a permanent, ongoing education. To learn from all the contacts one has means not just being a spectator and looking on, although careful observation of surrounding human affairs and attentive listening are vital. Rather, such learning necessitates participating, sharing views and perceptions, and more. Dewey’s (1985, pp. 7–9) notion of communication is germane here, predicated as it is on the fundamental idea that every genuine communication (as contrasted with an exchange of information) implies a transformation in participants’ outlooks and dispositions, however subtle or imperceptible it may be. Furthermore, people not only find themselves transformed through the course of genuine communication. They also find that this give-and-take can transform their interests, a consequence of great importance for the growth of both individuals and of democracy.

Dewey’s provocative closing sentence to *Democracy and Education*—“Interest in learning from all the contacts of life is the essential moral interest”—captures the core of his philosophy of education. I believe it points to an image of a dynamic public forum for debating purpose in teacher education and for acting, experimentally, on various conceptions of purpose. To sketch this image, I want to substitute the terms “consequences” and “public” for “contacts” and “moral” in Dewey’s phrase. The result is what could have served, in my view, as the concluding sentence of *The Public and Its Problems* (1988),
one of Dewey’s major statements about society: interest in learning from all the consequences of life is the essential public interest.

This interest implies learning not just from some contacts or consequences, those, for example, which help people serve their own interests. Rather, the approach obliges persons to try to learn from all contacts and consequences, including those that may call their interests into question. Thus it fosters a critical attitude toward one’s own desires, aims, and conduct, as well as those of the various groupings and associations of which one is a member. In this light, according to Dewey, public interest is not a thing, entity, object, or possession. It is not a claim, argument, opinion, or belief. It is not a standpoint, position, posture, or platform. Public interest constitutes a living, dynamic process that pivots around a concern for the very next moment of associated human life in a particular domain of ideals and action. Public interest constitutes an orientation or point of view premised on the idea that persons can learn to learn from their experience. It points to a disposition of inquiry that ideally would saturate public affairs.

What might such an interest look like in practice, particularly with regards to the relation between education, teacher education, and society? For one thing, this interest would imply reconstructing how teacher educators perceive their various interests and commitments. Consider the values illustrated in the previous section of the chapter: preparation for life, academic learning, human development, and social justice. From one point of view, this diversity of values in itself is both intellectually and politically consequential. It reflects the fact that nobody has “the last word” on the nature and purposes of teacher preparation. It also makes possible a practical focus on specific dimensions of educational reality and need.

However, understood from the point of view of public interest as outlined here, these values can advance a parochial, territorial mentality. They can function as perceived end points, destinies, or king-of-the-hill interests, and oblige educators to bend their activity toward them rather than toward the situations and circumstances in front of their very noses. Teacher educators might instead consider values such as academic learning, diversity, and civic education as productive points of departure, or as beginnings, for further inquiry, test, and trial on how to create the richest educational experience possible. Like democracy itself—“a mode of associated living, of conjoint communicated experience”—teacher education perceived through the lens of public interest reaches beyond any single theoretical outlook or domain of value however estimable it may otherwise be.

Dewey’s image of public interest provides teacher educators a backdrop against which to weigh their values in comparison with values put forth by their peers and by other sectors of society. They can speak articulately on behalf of their values even while recognizing their contested and dynamic nature. They can inquire into the values other societal actors advance in order to appreciate their origins, appeal, and possible consequences if acted upon in teacher education and in teaching. Just as teacher educators urge teacher candidates to take all students seriously, despite any number of differences between them, so they can learn to learn from all the contacts they have in their own professional work. The values in such learning include becoming clearer, more discerning, and more critical about their own and others’ values and educational purposes. They include becoming more dedicated to modes of communication that are constituted by a passionate, disinterested interest—an interest not in the triumph of one’s values or interests but in their continued improvement, and perhaps transformation, through the crucible of educational thought, dialogue, and practice.
THE CULTIVATION OF PERSONHOOD AS A CRITERION FOR ASSESSING PURPOSE

Dewey’s conception of public interest generates a broad social criterion for assessing purpose in teacher education. A second, equally broad criterion springs from the question of what it means to be an educated person. In one sense, this question was answered in the first section of the chapter. Depending on their outlook, teacher educators would argue that an educated person is prepared to lead a productive life, has studied academics systematically, has been taught and supported through developmentally appropriate methods, has a democratic outlook, respects and understands diversity, and so forth. In other words, an educated person is a human being who embodies one or another of the cardinal values advanced by teachers and teacher educators.

However, there is another view of an educated person that emerges from the very same democratic notion Dewey puts forward in conceiving public interest. If democracy constitutes “more than a form of government” but rather “is primarily a mode of associated living, of conjoint communicated experience,” what does it take for an individual human being to participate in such experience? At a minimum, it seems, the person must understand how to “associate” with others through “communication” that is shared, interactive, and “conjoint.” That capacity implies social knowledge, social skill, and social commitment. But it also necessitates having something to contribute that nobody else can put forward, however modest it may be in comparison with the whole. Social change and, in particular, social improvement are inconceivable without individual response, imagination, and action.

The improvement may materialize in how a parent and child interact thanks to an idea one or the other conceives. It may surface in enhanced interaction between teacher and student, judge and jury, friend and friend, cabdriver and passenger, doctor and client, etc. The improvement may be in policy or in governance. In every case one or another person has to step forward, metaphorically speaking, into new terrain. Someone must advance an idea, notion, image, or possibility. Without these individual initiatives, there can be no association, no conjoint communicated experience, no education, no politics, in short nothing people mark out as remarkable and noteworthy in life.

Individuality is not necessarily coterminous with self (nor is it identical with “individualism” as a social or political theory). Every culture has a conception of the self or person that differs in substantive ways from other cultures. The self may be regarded as an autonomous entity or as a social, spiritual, natural, or composite entity. Regardless of these differences, however, what remains universal about culture is the recognition of individuality—for example, that he is a particularly talented shoe-maker, that she gardens more effectively than others, that he has greater patience as a painter, that she sings with greater range and nuance. Consider other lines of work undertaken today. Dentists the world over differ widely in ability, tact, insight, knowledge, personality, and stamina. So do bus drivers, storekeepers, school principals, hair stylists, and professional sports players. In one way or another, every culture both features and thrives on individuality, just as it does on understandings of community.

Dewey and other critics have argued that individual distinctiveness is crucial and precious in a society that aspires to be democratic in its life and practices. It is so, in part, because improvement in any domain of the human cannot emerge without individual initiative (which is not to imply such initiative is sufficient, as the previous section suggests). Individuality is also prized by democracy because this mode of life depends fundamentally on courage, hope, and faith in human possibility. Those qualities find embodiment in individual human beings, and they help form the moral structure
of “associated living, of conjoint communicated experience.” This conception of the person-in-democracy is at once both challenging and realizable.

It is challenging because to participate in democratic life implies having the courage to engage new ideas and perspectives. To recall Dewey’s terms addressed previously, it takes courage to cultivate interest “in learning from all the contacts of life.” That prospect can be frightening because the process of education always implies giving things up, however minute or modest they are in scope. When I learn to see history in a broader light I have to give up my previous, more narrow way of looking at the past. When I learn to interpret poetry I have to let go of previous assumptions about what language can do. When I grasp the insights of biology I take leave of former, perhaps highly bounded images of physical processes in nature. “The way of life is wonderful,” wrote Ralph Waldo Emerson; “it is by abandonment” (1983, p. 414). Emerson meant quite literally that wonder dwells only in the moment of encountering the new; it emerges only in the moment of risking the old. Put differently, education only happens when a person engages and lets in the new, which means abandoning one’s prior state of understanding. This posture necessitates courage, and thus steady encouragement from one’s teachers as well as supportive conditions in the environment.

It does not require heroism, save in particular circumstances. The changes denoted here are typically small if not microscopic in comparison with the totality of a person’s and community’s life. Nonetheless these modest changes have summative force. In addition, they stand as a permanent example to others of what transformation means and what it looks like in everyday human affairs. Thus, the perspective framed here is inhabitable or realizable precisely because it takes seriously the promise in each succeeding moment of human interaction. Each moment can be marked by a perhaps tiny but nonetheless additional and cumulative increment of awareness, mindfulness, appreciation, and concern. This conception of the person opens the door to endless individuality and multiple modes and expressions of identity (it also illustrates why the idea of personhood is larger than what is typically captured by the psychological concept human development). The conception conjures the idea of life as an ongoing education. To learn from all the contacts one has constitutes a life of expanding, deepening meaning and communication, however confusing and unsettling the process will sometimes be. It bears emphasizing that this image of an educated person is not dependent upon the individual’s particular station, formal degrees, or any other institutional criteria. A day care worker or waiter can display greater curiosity, wonder, and capacity to learn than the richest executive or most powerful scientist.

Teacher educators, who are themselves noninterchangeable, distinctive human beings, cannot help but hold a conception of personhood that informs their sense of purpose. It may not be articulate or thought through to a logical and practical conclusion, but it is operative. Consequently, teacher educators can only benefit from rendering visible their notions of personhood and how these jibe with their assumptions about education and society. It is a truism that education occurs one human being at a time. Moreover, no two persons learn in identical fashion, just as no two classrooms and no two schools feature the same ethos. The most glorious, inspiring ideals of social and political purpose will founder unless they are fused with a fine-grained image of the cultivation of individuality—and vice versa. The idea of public interest sketched previously and the notion of cultivating personhood outlined here constitute, together, a conceptual diptych useful for criticizing the underlying values in teacher education.
CONCLUSION: SUSTAINING DIALOGUE ON VALUE AND PURPOSE

What is the purpose of talking about the purposes of teacher education? Is it to hammer out a final version of “the” purpose which everyone can accept? Is it to elucidate a clearer understanding of the influence that conceptions of purpose have on teacher education practice? Is it a political mechanism for the educational community to demonstrate to the larger society that it knows what it is doing? Or is such talk a waste of time, as the long-standing presumptions about schooling with which this chapter opened suggest?

I hope the analysis here makes plain that it is important to distinguish between function and purpose. Function denotes maintenance, purpose the possibility of transformation. People may never be able to tell just how many social or psychological degrees of freedom they have to be creative—in other words, to conceive and realize purposes. But they do know the domain is larger than zero, perhaps larger than any teacher, philosopher, politician, or artist has yet shown. I believe this outlook renders it worthwhile and necessary to consider the purposes of teacher education.

Should such inquiry strive to produce a final agreement about values? Should teacher educators conclude that either preparation for productive life, academic learning, human development, or social justice captures “the” core value? Or should they encourage a thousand flowers to bloom, and assume that the purpose of teacher education includes all of these values and goals as well as others that might emerge over time? Should there be unity or diversity in values and purpose (see the chapter by Hugh Sackett in this section)?

Such questions are intimidating, at least at first glance, but they do not imply that teacher educators must choose between an absolutist or relativist standpoint. Neither posture appears to be tolerable or sustainable in a democratic society that is dependent, in turn, on education. Absolutism is not tolerable because a democracy, understood through a Deweyan lens, generates a multiplicity of points of view. It presumes that new values, aims, and hopes are constantly surfacing. Relativism is not tolerable because democracy rejects the premise that anything goes; it assumes that with rights come obligations and responsibilities. It presumes that it is both individually and communally demanding to dwell in a democracy. It presupposes a place for public interest rather than solely for particular interests.

Thus, to examine purpose in teacher education implies something other than a process that would terminate dialogue through a final agreement. Rather, inquiry into purpose is crucial to maintain dialogue. It functions to keep the conversation vibrant, dynamic, and consequential. Such talk is indispensable to the very existence of a sense of purpose. Without dialogue on purpose people can quickly become passive if not resigned to “the way things are.” Looked at from another angle, communication about purpose is not solely instrumental. It is not a mere means to an end, whether the latter be a new program, new protocol, or new institutional structure. Such interaction can certainly lead to these changes and, some would argue, is a sine qua non if the changes are to be intelligent and wise. However, dialogue about purpose embodies its own values, among them sustaining a sense of value (again, as contrasted with becoming passive), a sense of community (which often translates into critical energy), a sense of individuality (as each person articulates her or his outlook), and a sense of hope (that values matter in the world precisely because human life is not predetermined or predestined).

These points suggest that a core purpose of teacher education is to cultivate an open mind toward multiple views of educational purpose, and yet without lapsing into an uncritical or bland relativism (as if the mind were empty rather than open). Proponents of life preparation, academic learning, human development, and social justice can do more
than presume “others have their values, we have ours” and proceed to operate in isolation one from the other. Such a strategy is self-defeating. It generates increasing strain, anxiety, and wasted energy—not to mention rigid thinking—since it is much harder to sustain isolation than it is to accept the possibility of communication, however challenging the latter is to initiate and support. In some respects, it is more vital to retain an interest in learning from all the contacts of life than it is to bind oneself to a particular position, platform, or standpoint. To adopt this course, teacher educators will need both courage and the ability to become articulate in a new key. This posture does not imply abandoning their values. It is not a diminishment of commitment, but rather constitutes an escalation of commitment into a more complicated but ultimately more enriching democratic space. That space will always be both unsettling and inspiring; unsettling because nobody in it (including oneself or one’s community of purpose) has the last word, and inspiring precisely because nobody has that last word. The word—the purposes of teacher education and of education itself—is something for all to participate in generating anew.

This view of purpose, and of why it matters to communicate about purpose, can support the two additional aims of engagement mentioned at the start of this section. First, the dialogue creates a supportive ethos for research in teacher education. At one and the same time, this ethos encourages research and the criticism of its results. It fuels systematic inquiry into the consequences of differing values and purposes on teacher education. Second, the dialogue fortifies, edifies, and educates the participants in the teacher education community, such that when they interact with various societal constituents—policy makers, parents, community and business leaders, politicians, and so forth—they bring to the table a richer language, a broader vision, and a deeper sense of value and justification. They can juxtapose communication about what teachers need in their preparation programs with dialogue about what teachers deserve if they are to carry out the distinctive, complex, and indispensable tasks that society sets before them.

NOTE

1 I use the term “experimentally” in the Deweyan sense of practices formed through an intelligent trial of ideas and methods. This use should not be conflated with the formal meaning of a scientific experiment that deploys control and treatment groups, etc.

REFERENCES

Note: In addition to works referenced directly in the chapter, the readings below provide useful perspectives and background for engaging the question of purpose in teacher education.

3 Teacher education in a democratic society

Learning and teaching the practices of democratic participation

*Emily Robertson*

Syracuse University

The essential feature of a democratic polity is its concern for the participation of the member in the process by which the community is governed.

*(Tussman, 1960, p. 105)*

**TEACHER EDUCATION AND THE CONTEMPORARY POLITICAL CONTEXT FOR CIVIC PARTICIPATION**

It is frequently claimed that many United States citizens are politically ill informed and fail to participate in the political process. More people can name the Three Stooges than can name the three branches of government (Westheimer & Kahne, 2004). Only 8 percent of college graduates from 1982 to 1992 who were surveyed in the National Election Studies had ever written a letter to a public official and only 7 percent had worked for a party or candidate (Nie & Hillygus, 2001). Not all the news is bad. American youth are increasingly engaged in community service: Eighty-two percent of 2004 first year college students surveyed reported engaging in volunteer work as high school seniors (Williams, 2005). Yet volunteer work, unlike the war protests and civil rights movements of earlier generations, involves students in serving the public good but not necessarily in distinctively democratic political action.

In the wake of the last presidential election, the quality of public political discourse has been under attack. In a *New York Times* Op-Ed piece, “Is Persuasion Dead?” Matt Miller (2005) asked: “Is it possible in America today to convince anyone of anything he doesn’t already believe? If so, are there enough places where this mingling of minds occurs to sustain a democracy?” (p. A15). Miller’s question was echoed by Paul Krugman’s (2005) complaint that neither politicians nor the electorate are willing to change their views when confronted with decisive contrary evidence. Ideological polarization, the “red” states versus the “blue” states, is evident not only in the electorate but also in the House, whose members are often elected from districts created by partisan gerrymandering. Both a gerrymandered House and the niche market media create situations in which people have no need to speak to any but the like-minded (Rosen, 2005; Posner, 2005). Richard Posner (2005) holds that people read newspapers, not to become well informed, but to find “information that will support rather than undermine their existing beliefs” (p. 9).

Education has been identified as both part of the cause of the current state of democratic political participation and as part of the potential solution, although where the solution lies is contested. Diane Ravitch and Joseph P. Viteritti (2001a) say that, while Americans have traditionally relied on public schooling to transmit “deeply cherished democratic values,” there is currently concern that schools are no longer playing this role. In their
view, today’s students fail to acquire core civic knowledge, such as an understanding of how our government works, but rather encounter in public schools a multiculturalist curriculum that does not aim at “the overarching civic ideals of the American community” (p. 5). Ravitch and Viteritti’s critique shares common ground with Steiner and Rozen’s claim that teachers are trained in education schools that are lacking in “balance” and are dominated by “progressivist” and “constructivist” visions where they encounter a “countercultural” curriculum, “instilling mistrust of the system that teachers work in” (as cited in Hartocollis, 2005, p. 25). In general, those who take this perspective favor greater teacher and school accountability through the standards and assessment movements and legislation such as No Child Left Behind (NCLB). Their view of civic education focuses on the acquisition of knowledge about American history and government and on sharing common civic ideals.

On the other hand, there are those who believe that education for democracy in the United States must involve a commitment to social justice, which requires attention to diversity in an increasingly multicultural society. Walter C. Parker (2003), for example, holds that democratic citizens require a conception of justice that includes a “capacity for recognizing patterns of domination and unfairness that may be lodged comfortably in everyday life and for working toward alternative ways of living together” (p. 73). The implications of this view for principles of teacher education as drawn by Marilyn Cochran-Smith (2004) include making “inequity, power, and activism explicit parts of the curriculum” (p. 77).

Advocates of the social justice perspective are by no means convinced that theirs is the dominant view in teacher education, unlike the critics cited above. Jacqueline Jordan Irvine’s (2004) assessment is that the “field of teacher education has not taken seriously its role to prepare teachers as activists and advocates of social justice” (p. xii). She holds that the leadership of schools of education must create an environment that exemplifies and values diversity and that faculty committed to social justice must make their political stances clear. Although in agreement with NCLB’s goal of eliminating the gaps in group achievement levels, the supporters of democratic education for social justice generally believe that NCLB’s implementation has resulted in methods of teaching and a narrow curriculum that do not serve the goal of democratic education. High stakes testing and the standards movement have similar effects, it is said (Michelli & Keiser, 2005).

Thus the debates about educating democratic citizens, and the knowledge and commitments their teachers should have, seem as polarized as the rest of the political landscape. The differences in perspective can be exaggerated: likely everyone thinks it would be good if students knew more about the workings of government and likely everyone believes that achieving greater social justice is an important democratic goal, even if there is disagreement about what these objectives mean. Nevertheless, democratic education of students and its implications for teacher education are contested terrains—what democracy is; what constitutes appropriate participation; how to educate for democracy; the contributions of higher education generally and teacher education in particular are all disputed. For example, Derek Heater (2004) provides the following list of contemporary controversies concerning American civic education: “multicultural vs. national cohesion objectives, national vs. world citizenship, structure of the disciplines vs. problems of democracy approaches, learning about institutions vs. learning civic behavior, academic study vs. community service” (p. 124).

The contentiousness of civic education is not simply a contemporary phenomenon. While historically Americans have expected schools to prepare future citizens, what that participation entailed—and who counted as a “citizen”—depended on the dominant
political values and prejudices of the period. Areas of focus have included moral virtue, American history, the principles of the Constitution and of American government, patriotism and nationalism, world citizenship and tolerance, social issues, and civic participation (Reuben, 2005; Heater, 2004). Injustices related to race, ethnicity, gender, and religion have represented repeated challenges to the democratic rhetoric of political equality. Current attempts at civic education at the elementary level include celebrating national holidays, learning about community helpers, and a focus on the rule of law, American history, the Bill of Rights, and the Constitution. At the secondary level, students typically have at least a year of American history and one semester of government (Heater, 2004).

Given this background of polarization and controversy, any discussion of democratic education must occupy a non-neutral terrain. Accordingly, my treatment of teacher education and its relation to democracy takes place within a particular context that gives salience to some issues rather than others. (And that’s a good thing, given that searches for key terms in my university’s library consistently turned up more than 10,000 entries for each term, the system’s maximum reporting capacity.) The social and political context for this essay includes the perceived state of democratic participation in the United States, the polarized political climate, the educational assessment and accountability movements, challenges to schools of education as the best location for teacher education, and the growing interest in civic education on the part of higher education institutions. Also, I have chosen to focus on civic education in the United States, although I am well aware that democracy is a global phenomenon and that many who live in the United States and participate in democratic life are not citizens. The specific focus of this chapter is on modes of democratic participation and their implications for pre-service teacher education.

The virtues we imagine citizens should possess depend in part on our conception of political life. What is the political domain, the sphere of civic action? And what actions are called for in that domain? My conception of the domain of political action in this chapter is an expansive one. My main focus is, in Dewey’s (1966/1916) terms, on democracy as “a mode of associated living, of conjoint communicated experience” (p. 87). No doubt United States citizens should study American history and government. But the fundamental commitments of citizens of a liberal democratic society to the political equality of all citizens and to all citizens’ rights to basic liberties and opportunities that are protected even against the majority are formed through participation with others in democratic modes of communication and action. What are the “habits of the heart” that sustain a democratic mode of life and what roles can education, including teacher education, play in cultivating them (Bellah et al., 1985)?

I will argue that the role of citizen in a liberal democracy requires the ability to engage in multiple practices through which citizens co-determine the goods they will pursue together as citizens and negotiate the differences that divide them. The fact that citizens hold different and conflicting views about how individual and public life should be led, as well about what justice demands, makes these negotiations necessary. The freedom a liberal democratic society provides for voicing differences of opinion and acting on them, within the limits of the law, makes continuous conversation about public matters a requirement of democratic life. The political polarization described earlier represents a failure of engagement in this fundamental democratic task: if there is no “mingling of minds,” no willingness to change one’s views in the give and take of conversation, no openness to engaging with any but the likeminded, can democracy worthy of the name be sustained?

Further, I will argue that the knowledge, skills, and virtues required to participate in
democratic practices of engagement set goals for the education of democratic citizens, as well as supplying goals for the education of the teachers who will help develop these capacities in each new generation. Finally, I suggest that the ability of schools of education, and higher education institutions generally, to contribute to civic education depends on creating and maintaining their autonomy from centers of power in the society that might corrupt this mission.

THE CIVIC SPHERE AND THE PRACTICES OF DEMOCRATIC CITIZENS

The contexts that come readily to mind when democratic political action is invoked are places such as legislatures, town councils, and school boards where participants are making decisions that are binding for a particular polity. Recently, however, theorists have explored the potential of civil society for democratic action. “Civil society” refers to the social sphere of voluntary associations formed by citizens to express their interests and commitments, associations that are largely outside the spheres of the economy and the state. As Iris Marion Young (2000) says: “In the associations of civil society people co-ordinate their actions by discussing and working things out, rather than by checking prices or looking up the rules” (p. 159). Civil society, in this sense, includes churches, neighborhood associations, workers’ organizations, political action groups, clubs, cultural organizations, non-profit service providers, civic associations, and many others. Such groups may provide services for their members, can expose injustice in the political and economic spheres, and sometimes succeed in placing limits on state and economic power. Young suggests categorizing these associations as private, civic, and political. Although not all associations in civil society are positive (e.g. the Ku Klux Klan), in their civic and political forms, these associations have the potential for strengthening democratic life. The inclusion of civil society in the political domain extends the possibilities for political action beyond the sphere of the state and opens up wider possibilities for democratic participation. The expansion of the political sphere to include civil society mirrors Dewey’s expansive and inclusive conception of democratic life previously invoked.

Further, Jane Mansbridge (1999) argues for including what she calls “everyday talk” as a potential site for political action. Mansbridge defines as political “‘that which the public ought to discuss’ when that discussion forms part of some, perhaps highly informal, version of a collective ‘decision’” (p. 214). While legislatures aim at decisions that will be binding on the participants, everyday talk creates the climate of opinion within which binding decisions can be made (or through which such decisions are realized). From this perspective, Mansbridge suggests, “The snort of derision one might give at a sexist television character while watching with friends” is a political act (p. 214).

What types of actions do we engage in as citizens, not only in contexts where authoritative decisions are being made, but also in associational life and through everyday talk? And what knowledge, skills, and virtues do these forms of action require? Michael Walzer (2004) has emphasized the variety of forms of political participation, including (among others) political education, voting, campaigning, fund raising, demonstrating, and “scut work,” such as stuffing envelopes. Yet these particular activities are embedded in more general types of practices that orient our engagement with other citizens around the issues that divide us.

With these political contexts in mind, I will consider three categories of interpersonal relationships among democratic citizens: (1) deliberation; (2) negotiation and bargaining; and (3) activism. These practices represent different visions of the work of citizens and
their proper orientation to each other. Moreover, these forms of interaction are often in tension with each other, as we shall see. Yet my thesis is that democratic political life requires them all. While some citizens may specialize in one category or another as life stances, most of us are called upon to engage in all three categories of action, at least within the sphere of civil society and everyday talk. The role of formal education in developing them is what I want to explore, along with what these practices imply for the purposes of teacher education in a democratic society.

**Deliberation**

Many of the recent discussions of civic virtue assume that the prime thing citizens ought to do together is deliberate. I have in mind here theories of what is called “deliberative democracy” (Gutmann & Thompson, 2004; Gutmann & Thompson, 1996; Macedo, 1999). From this perspective, when confronted with a public problem, citizens should try to figure out the best solution to the problem through joint consideration of the reasons for and against proposed courses of action. Alan Wertheimer (1999) says that: “In general, we deliberate with each other when we think that (1) there is a right answer to an issue and (2) discussion will move us closer to that answer” (p. 171). Walzer (2004) characterizes deliberation as “a rational process of discussion among equals, who listen respectfully to each other’s views, weigh the available data, consider alternative possibilities, argue about relevance and worthiness, and then choose the best policy for the country or the best person for the office” (p. 91). When citizens deliberate, then, they seek the best policy or the best course of action through analysis of the available evidence in a process of rational discussion with fellow participants. Deliberation is not just a sharing of perspectives but rather “discussion with an eye toward decision making” even when the participants are not themselves the primary decision makers (Parker, 2003, p. 81).

Juries are examples of citizen deliberation. We assume that there is a truth of the matter—the person charged is either guilty or innocent. The jury’s task is to assess the evidence and decide on a verdict. We do not think that jurors should compromise or “split the difference” when there is disagreement. If the charge is murder in the first degree and some jurors believe that the defendant is guilty while others think he is totally innocent, it would be wrong of them to compromise by convicting him of a lesser charge, say manslaughter. Their task is to agree on the direction the available evidence points or to acknowledge that they cannot reach a verdict. Negotiations may take place behind the scenes among lawyers, defendants, and prosecutors; but juries should not negotiate. On the other hand, friends debating which movie to see normally do not think there is an objectively right answer. They seek to accommodate each other, to find a movie each wants to see. They do not, in the sense described above, “deliberate” (Walzer, 2004; Wertheimer, 1999).

All theories of deliberative democracy attempt to specify the conditions under which public deliberations can be regarded as legitimate (e.g. that all citizens should have an equal and effective right to participate) and they attempt to specify the citizen virtues that are required for successful public deliberation (e.g. willingness to listen to and seriously entertain other citizens’ points of view). The point of the deliberation is to convert disagreement into agreement about what to do by determining which proposals are supported by the best reasons. Deliberative democrats recognize that disagreement may be persistent. Nevertheless, they believe that the mutual respect involved in the process of deliberation will enhance the legitimacy of whatever decision is ultimately made even in the eyes of those who lose out.

While deliberation is a familiar activity, it is perhaps not often realized quite how
strenuous the ideal is. Deliberation is not merely talking nor is it a debate. As Deborah Tannen ([1998] 1999) puts the point in *The Argument Culture*: “Public discourse requires *making* an argument for a point of view, not *having* an argument—as in having a fight” (p. 4). In a debate, the opponents are trying to win, not to discover the truth. They may present the evidence that favors their case and suppress the contrary evidence, for example. Debaters are not trying to find the best solution by keeping an open mind about the opponent’s point of view. Unlike deliberators, debaters are typically not open to the possibility of being shown wrong (Walzer, 2004). Neither is deliberation simply a matter of the airing of opinions in which each participant is regarded as having a right to his or her own point of view. Deliberation involves joint inquiry in which evidence is collected and brought to bear on a problem and multiple theories and interpretations are examined. Thus that participants change their views as the deliberations unfold is one indication that real deliberation is taking place (Simon, 2005).

Preparing future citizens to deliberate, then, requires a focus on a particular set of skills and dispositions. Effective deliberators should be able to construct sound arguments for their positions but should also be open to changing their views when confronted with better arguments. Like Dewey, deliberative democrats see communal political discourse as joint inquiry that is self-correcting given the right conditions (Michelli, 2005). Deliberation is, as previously noted, not a debate but rather a collaborative inquiry into questions affecting the public good: seeing what is at stake, bringing evidence and alternative perspectives to bear on the question, developing an opinion, assessing the fairness of the decision-making process (Simon, 2005).

Since diversity of perspective is a deliberative asset, willingness to listen to others who disagree with you is a deliberative virtue. So also is support for the principles that constitute the grounds for free and fair exchange of ideas: respect for the rights of others; nondiscrimination; the freedom and equality of all citizens; civility; mutual respect; tolerance of dissent; openness to different points of view. As deliberative democrat Amy Gutmann (2005) puts the point, the goal of civic education is to prepare citizens with “the ability to argue and appreciate, understand and criticize, persuade and collectively decide in a way that is mutually respectable even if not universally acceptable” (p. 358). Since, as Gutmann suggests, consensus may not be reached on contentious issues, citizens must be willing to respect decisions reached through fair procedures even if they disagree and intend to continue trying to persuade their fellow citizens to change their judgments.

There is a considerable consensus in the literature that one of the best ways to develop deliberative capacities in students is to engage them in discussion of controversial issues (Gutmann, 2005; Johnson *et al.*, 2000; Parker, 2003; Simon, 2005). If the issues were not controversial, deliberation would not be required. Sometimes the preferred issues are those close to home, such as classroom and school policies, where students may be able to influence the outcome. But often students are engaged in deliberating public policy questions such as free trade or environmental treaties. Parker (2003) offers a curriculum for a high school course in deliberation that teaches students a framework for policy analysis. The National Issues Forum (NIF) network promotes a deliberative focus on policy issues, using material provided through the Public Agenda Foundation. In Project 540, students define their own topics for deliberation. This program has involved 250 high schools and over 140,000 students since 2002 (Johanek & Puckett, 2005).

In her study of 50 secondary schools in five countries (England, Denmark, Germany, the Netherlands, and the United States), Hahn (1998) found that students who had opportunities to discuss controversial issues in classrooms where they felt free to express their views developed more positive political attitudes than students lacking such
experiences. Such discussions were most effective when the classroom was open to multiple points of view and students felt able to express views that differed from those of their peers or their teacher. Students having such experiences expressed “higher levels of political efficacy, interest, trust, and confidence” (p. 245).

The implication of a focus on developing students’ deliberative capacities for teacher education is that teachers should learn how to conduct deliberative discussions and create supportive classroom environments. If we are to encourage deliberation in students “we would have to incorporate facilitation skills in significant ways into teacher education programs and ongoing professional development efforts,” notes Simon (2005, p. 112). Simon contrasts classroom deliberation with the simple acquisition and recall of information that she believes dominates classrooms. Of course, deliberative discussions need to be informed, but Simon argues that such discussions take longer than straightforward knowledge acquisition and hence there will be some tradeoff between deliberative discussion and content coverage. Standardized tests and high stakes testing are often barriers to classroom deliberation, she says, because deliberative capacities are not tested for and teachers are reluctant to spend time on things that are not tested. They may also be afraid of getting into trouble through discussion of controversial issues. Parker (2003) offers an account, based on his own experience, of how pre-service teachers can learn to lead deliberative discussions (Chapter 7). Drawing on the work of Morton Deutsch on conflict resolution, Johnson, Johnson, and Tjosveld (2000) have trained teachers and administrators in techniques of “constructive controversy,” which engage students in deliberative discussion of controversial issues.

Is deliberation a frequent component of public political life? Admittedly, it does not seem to capture the real world very well. If we think about the quality of conversation in the last Presidential election, reasonableness, open-mindedness, willingness to be shown wrong, are not the first adjectives that come to mind. Even advocates of the deliberative view acknowledge that the actual political process does not often exemplify deliberation, so students may have rarely seen examples (Simon, 2005). But the model offers an ideal to be aspired to, not a description of reality. To what extent should political discussion depend on mutual persuasion about the rightness of particular policies and courses of action? Can democratic interpersonal political communication rightly take other forms? Are these alternatives morally second best to deliberation even if they may be more efficient or expedient? Advocates of deliberation do not generally argue that deliberation is the only acceptable political activity, but they do tend to think that it has moral advantages over other activities and should be preferred when possible. Is this true?

Dewey (1966/1916) modeled public political discourse as joint inquiry. But others have held that in a democratic society, deliberation plays a more limited role. Some believe that the deliberative stance pays too little attention to “the degree to which moral disagreements in politics are shaped by differences of interest and power” (Shapiro, 1999, p. 29). Daniel Bell (1999) argues that if a country is deeply divided between rich and poor and lacks a sense of community and mutual trust, “the solution might be expropriation rather than deliberation” (p. 73). The political philosopher Will Kymlicka (2003) has recently suggested that cooperation among diverse groups may be “more a matter of bargaining and negotiation than of genuinely shared deliberation or mutual understanding” (p. 165). Are advocates of deliberation attempting to transcend politics—are they trying to create “a world where political conflict, class struggle, and cultural difference are all replaced by pure deliberation?” asks Walzer (2004, p. 105).

Deliberation can enhance disagreement rather than bringing about convergence. Religious differences may prove irreconcilable, for example, or citizens may become
more aware of their class interests through discussion and hence more aware of how their interests diverge from those of other citizens. In a liberal democratic society such as the United States where there are diverse groups with different perspectives as well as conflicting interests, reaching agreement on what is true or best as a way of deciding what to do may be less likely to produce a solution acceptable to all than accommodation of conflicting interests. A political order based on agreement about what is true (a theocracy, for example) is different from a liberal democratic political order that attempts to encompass citizens with different conceptions of the good.

Negotiation and bargaining

Bargains represent the balance of power not the force of the arguments. The parties trying to reach agreement are seeking to secure their own interests, not necessarily to transcend them through appeal to a common conception of justice or concern for the common good, as the deliberative democrat might want. However, since agreements are more likely to be stable if they give each party a decent measure of satisfaction of their interests, accommodating each other will generally be in the interest of each of the negotiating parties. Wertheimer (1999) says that “We may seek to accommodate each other when we believe that there is no right answer to an issue or that continued deliberation will not likely resolve the dispute (even if there is a right answer)” (p. 171). An accommodation attempts to reach an agreement all can accept. Nevertheless, a mutually agreed to bargain or accommodation may not represent anyone’s idea of the best solution. It may not coincide with either party’s conception of the just outcome or the one best supported by the available reasons.

Advocates of deliberative democracy are wary of negotiation even as they sometimes acknowledge the need for it. Parker (2003), for example, distinguishes negotiation from deliberation by noting that bargaining assumes competing interests and involves “at least two groups present in the same forum engaged in an adversarial contest” (p. 81). Gutmann (2005) says that bargaining is “self-interested or group-interested”—a “politics of manipulation and coercion” rather than “a politics of reasoning and persuasion” (p. 354). And she notes: “Without the capacity to deliberate, there would be no escaping from power politics—which give power priority over both justice and deliberation—which all moral conceptions of democracy are intent on avoiding” (p. 353). Gutmann does acknowledge, however, that bargaining and negotiation might be called for in situations where no moral issue is at stake or at least one party to the dispute is unwilling to take a moral point of view and so those who did so would be disadvantaged.

Gutmann and Thompson (1999) contrast “the positive case of finding grounds of moral accommodation with similarly motivated political adversaries and the negative case of reaching compromises that undermine one’s fundamental principles” (p. 266). New York Senator Hilary Clinton’s suggestion that both pro-life and pro-choice advocates can support a program for preventing unwanted pregnancies is an example of positive moral accommodation. A hypothetical case in which a pro-life person proposes giving up the effort to make abortion illegal in exchange for a pro-choice advocate’s support of the Hyde amendment (which denies federal funds for abortions for poor women) would be an example of the latter, of compromising one’s principles.

Skepticism about the morality of bargaining in politics may be part of what gives politics a bad name. Hahn (1998) found low levels of political trust among all adolescents in her multi-country study of secondary school students. Only about 20 percent of adolescents said that they respect those who hold public office. She notes that few students reported ever meeting a politician. They gained their views from media reports
of scandals, especially in the tabloid press, and from their parents. Hahn asks what these attitudes mean for the survival of the ideal of representative democracy.

But is negotiation or bargaining necessarily morally suspect? Strategies for forging agreements among opposing parties obviously vary. A winner take all power politics leaves a few crumbs at best for the loser. Competitive struggles are determined by the balance of power or by force. Yet bargains are required when each side needs the other. If one side can force its will on others, there is no need to negotiate. Generally, parties in a bargaining or negotiating situation have interdependent interests; they need each other’s cooperation to some extent in order to serve their own interests. Each has some power either to promote or to frustrate the other’s satisfaction of their needs.

Morton Deutsch’s theory of negotiation emphasizes this interdependence rather than competitive struggle (2000a). From this perspective, constructive conflict resolution requires shifting perspective from conflicts in world-views or moral principles (which usually are non-negotiable) toward the primary interests of the conflicting parties. What is required is to enlist the parties in a collaborative investigation of how to satisfy the primary interests of each in the specific context. In a sense, this strategy transforms negotiations into deliberation about how to reach an agreement all can accept. Yet the agreement sought is not the objectively right outcome but an arrangement that accommodates each of the parties.

Some of the most difficult conflicts are those where moral principles cannot be set aside because the conflict concerns different interpretations of principles of justice. Deutsch (2000b) offers an example of a mediated conflict resolution where the conflict involved how teacher representatives to a site-based management team should be selected. The issue was whether seats should be designated for teachers from minority groups that were heavily represented among the students but not among the teachers. The school’s Black Teacher Caucus held that the management team needed their input, given the diversity of the student body and the importance of the school’s dealing with increases in bias related incidents and developing a curriculum more relevant to the current student population. The majority of council members held that all members should be elected through democratic procedures and that setting aside a seat for an African American teacher would open the door to still other seats dedicated to other minority groups. With the help of a mediator, they were ultimately able to agree on a solution that involved the principal’s appointing a seven person multicultural task force each year from which two members of the council would be selected, one at large by vote of the task force and one from the ethnic group most prevalent in the student population (pp. 3–4). The challenge in such cases is to find a creative solution that allows the claims of each side to be represented and the principles that each invokes to be included (Deutsch, 2000a).

Despite the disdain sometimes expressed by deliberative democrats of negotiation as a moral enterprise, democratic citizens arguably need the virtues and skills of conflict resolution that are useful in finding peaceful accommodation of others’ interests or creative solutions to conflicts of moral principles. Aside from skills in conflict resolution, citizens prepared to engage in constructive negotiation require problem-solving skills, self-control, ability to take the perspectives of others, ability to communicate well, cooperativeness, and awareness of bias (Sandy & Cochran, 2000).

There are numerous programs for teaching conflict resolution skills to children and adolescents in schools, as well as to their teachers through in-service workshops. Since the 1980s, Educators for Social Responsibility (2005) has advocated teaching students ways of peaceably and creatively resolving conflicts as a way of producing safe and supportive learning environments. In 2003, their Resolving Conflict Creatively Program for grades K-8, originally developed with the New York City Schools, was in 400 schools in the
United States. Sandy and Cochran (2000) provide examples of programs serving youth from early childhood to adolescence, including the Peaceful Kids Early Childhood Social-Emotional Learning Program developed in 1998 at the International Center for Cooperation and Conflict Resolution at Teachers College (Columbia University, New York City).

The most frequently mentioned aims of these programs include: reducing school violence; generating positive inter-group relations; reducing prejudice; creating good learning environments; helping students develop pro-social skills that will aid their personal growth and their success in school and in the workplace; and fostering responsible citizenship. That conflict resolution skills might make a contribution to the practices of democratic citizenship can certainly be inferred from these aims, but the connections are not fully developed in the materials surveyed for this chapter. However, given the persistence of disagreement among citizens about which policies and practices are best, the attitudes and strategies fostered by training in creative conflict resolution offers a positive alternative to the polarization we currently confront. If teachers were to help students develop such capacities, they would need training, not only in conflict resolution strategies, but also in how to teach such strategies to others. The experiences of numerous practitioners who have conducted workshops in conflict resolutions in various settings could be a resource for such training (Raider et al., 2000).

There are, however, limitations to the scope of constructive conflict resolution. When conflict is generated by injustice, especially injustice that is difficult to recognize by those who perpetrate it because it is embedded within major social institutions, a reorientation of thinking is required, not simply creative solutions. Some citizens must learn to enlarge the scope of their moral communities and recognize their complicity in the persistence of unjust treatment of other citizens. Those who have been unjustly treated are often more likely to recognize their situation and organize to become forces for social change. This work exemplifies the final practice of democratic citizenship surveyed here, activism oriented toward social justice.

**Activism**

Activism can be engaged in from any point in the political spectrum and for different purposes. Here I will focus on activism that is oriented toward achieving greater social justice, a form of activism especially relevant to democratic citizenship.

While deliberating and bargaining tend to take place within given social structures, activists work to change structures they view as unjust. They attend to differences of power, to the way the context of discussion has been framed by actions outside its scope. The activist believes that deliberation typically occurs in contexts that have been structured in ways that serve the interests of those in power. Thus deliberation is not likely to be effective in securing greater social justice or advancing the interests of the oppressed. Activists employ other strategies of mobilization, protest, and disruption that call attention to their causes. Unlike bargainers, activists are not usually motivated solely by their own or their group’s interests. Rather, they see themselves as acting in the interest of principles of justice (Young, 2002). Some citizens make activism their life’s work, their profession in effect. They identify with a social movement and devote themselves to realizing its goals. The civil rights movement, feminist movements, disability rights, gay pride, PETA, ACT UP are but part of a long list of causes.

Citizens may have moments of activism within everyday talk even if it is not a major part of their identities. The following example is taken from Jane Mansbridge’s (1999) research. An African American woman went with her husband to his family’s home in the South. At dinner, the men gathered at the table while the women went into the kitchen.
and came back with plates filled with food for the men. The visiting woman had remained seated at the table. Her husband asked her to fill his plate. She said, “I don’t fill your plate at home. Why would I do it here?” And the other women sat down as well and stopped waiting on the men. The woman said, “Well, what I did was I ended up like liberating the other women in the family.” Mansbridge comments: “With this small act—a combination of speech, and, in this case, nonperformance of an expected action—[she] . . . intervened in her own and others’ lives to promote a relatively new ideal of gender justice, exemplified by her verb ‘liberating’” (pp. 217–218).

The contradiction between democratic commitment to political equality and fair opportunity and disparities in schooling help fuel a commitment to teaching for social justice and a conception of teachers as change agents (Cochran-Smith, 2004; Hytten, 2006; Villegas & Lucas, 2002). Villagas and Lucas (2002) assert: “The consistent gap between racial/ethnic minority and poor students and their white, middle-class peers in scores on standardized tests is indicative of the inability of the educational system to effectively teach students of color as schools have traditionally been structured” (p. 9). Advocates of teaching for social justice argue that the gap cannot be closed simply by training prospective teachers in research-based pedagogical practices, but rather requires challenging the “structural inequalities embedded in the United States’ system of schooling [that] perpetuate hierarchies of domination closely linked to race and class . . . Activism, and analysis of power and social inequalities [must be made] part of the curriculum” (Rubin & Justice, 2005, p. 80).

Educating teachers for activism, then, requires fostering a strong commitment to social justice, but that commitment alone is not enough. Teacher educators committed to teaching for social justice help pre-service teachers to see injustice related to race and class in tracking or in lowered expectations and in differences in school facilities, for example, and to understand the dynamics of power and privilege as they are manifest in the “systematic production of inequality” (Parker, 2003, p. 154). They help pre-service teachers develop teaching stances and styles that engage, and are sensitive to, their students’ experiences and perspectives. They challenge pre-service teachers to examine their own perspectives for the ways they have been shaped by their social and cultural locations and hence may harbor biases and stereotypes (Applebaum, 2004). They encourage pre-service teachers in developing ways to engage effectively with others from different backgrounds (Rubin & Justice, 2005; Lucas, 2003). They help pre-service teachers to see the diverse backgrounds and perspectives of their students as assets rather than deficits, and they encourage teaching techniques and assessment practices that promote learning for all students (Villegas & Lucas, 2002). But beyond acquiring and transmitting to their own students the perspectives, knowledge, and skills described above, activist teachers require the courage to challenge injustice in the educational system.

As noted above, activism is not the sole province of any one political perspective. Students can be taught to critically examine existing practices and to advocate for the social and political changes they believe are justified whatever their particular viewpoints. Teaching for social justice, however, does involve substantive political commitments, as we have seen. Some critics are concerned that such teaching is partisan. Ruth Grant (1996) argues that classrooms should engage students in “conversation aimed at genuine inquiry” rather than conversation “aimed at producing a consensus on a predetermined position or point of view” (pp. 476–477). While commitment to social justice is a constitutive feature of liberal democracy, citizens have different conceptions of what justice is and what it requires. The danger of activism from the perspective of deliberative democracy is that the activists will be so persuaded of the rightness of their own positions that they will be unwilling to engage in genuine deliberation with those
who hold opposing views. And once the issues have been framed as matters of justice, the prospects for negotiation and compromise will be limited.

**DEMOCRATIC PRACTICES: MUST WE CHOOSE?**

A democratic citizen should have the knowledge, skills, and commitments necessary for the various practices required by a democratic life that likely will always be full of contention. Deliberation, negotiation, and activism are core practices in which citizens engage with each other over the issues that divide them. The democratic culture sets the ground rules for engagement: a commitment to the freedom and equality of all citizens (Rawls, 1993). A robust civic education, fueled in part through democratic-minded teacher education, fosters the democratic culture through preparing future citizens for participation in the basic practices of democratic life.

There are both commonalities and tensions among these practices. For example, both deliberation and activism, as I have portrayed them, aim at the common good. In deliberative fora, citizens speak from their own perspectives, of course, but they are expected to be open to rational persuasion about which solution to their common problem is best. Activism that aims at social justice seeks to educate, and appeal to, a conception of the appropriate treatment of persons and the equality of citizens. While redistribution of social goods may advantage some more than others, for example, the reason for the redistribution activists seek is remedying injustice, not responding to special interests.

By contrast, negotiation aims at mutual accommodation of interests and thus has appeared to some to be inferior to the moral stances of deliberation and the demand for social justice. Bargaining is not oriented toward the common good and it is extremely doubtful that a “hidden hand” will see to it that the common good is served by the pursuit of individual and group interests. Yet deliberative democrats acknowledge that agreement is not always forthcoming. Disagreement is a ubiquitous fact of democratic political life. John Rawls (1993) has argued that such disagreement can persist without anyone’s being ill-informed or mistaken about the facts, because, for example, different groups may assign different weightings to competing values. Joseph M. Schwartz (1995) argues for the “permanence of the political.” By that phrase, he means that even in “a relatively egalitarian political community” there will still be “spirited political disagreement and contestation” (p. 19). He suggests that radical democratic theorists have underestimated the persistence of conflict and have supposed that politics as the mediation of conflicting interests could be eliminated in a truly just and egalitarian society. Deliberation and activism share a hope that conflict can be eliminated by seeking truth, whether it is the truth about which policy is best or how justice can be achieved. Negotiation (or “politics” in Schwartz’s formulation) acknowledges the radical pluralism of interests and cultural commitments that makes overcoming conflict unlikely except through repression.

While the deliberative forum strives to be a power free zone, negotiation and activism recognize, in their own ways, the reality of differential distribution of power. Each is willing to use power in pursuit of its goals, unlike the deliberator’s focus on rational persuasion. While activism aimed at social justice seeks a redistribution of power, negotiation acknowledges the existing power relationships. Yet constructive negotiation relies on the interdependence of even those with unequal power and the capacity of each party to thwart the interests of the others.

How, then, shall we live together as democratic citizens in the face of continuing disagreement? Should we choose among these practices? Deliberation has much to
recommend it even if agreement is not always reached. In public political contexts, voting or the courts may decide the matter for the time being, while deliberation continues. But in civil society or everyday life, beyond the reach of voting and courts, trying to achieve mutual accommodation with others through agreements that satisfy the primary interests of each group seems equally a staple of democratic life. And legislative proposals themselves typically embody bargains based on accommodation of different interests. Lack of willingness to accommodate others, insisting on one’s own claim to truth, thwarts legislative action and polarizes the electorate. But when conflict is generated by injustice, especially injustice that is difficult to recognize by those who perpetrate it because it is embedded within major social institutions, a reorientation of thinking is required, not simply creative accommodations of interests. Thus activism oriented to social justice has its distinct claim on democratic life.

Thus it is no surprise that, while I have described each of these political practices independently, in reality, they often appear in combination. For example, a New York Times’ reporter was struck by the oddity of two Act-Up (the Aids Coalition to Unleash Power) protesters engaged in a “die-in” while wearing sports jackets and ties. When she followed up, she learned that, after the protest, they were attending a meeting at the office of the United States trade representative (as cited in Levinson, 2002). Activism aimed at changing citizens’ awareness of issues is not incompatible with employing deliberative strategies when they are available.

In Democracy and Disagreement, deliberative democrats Gutmann and Thompson (1996) consider the example of the strategies used by Senator Carol Moseley Braun to defeat efforts to renew the Daughters of the Confederacy’s patent on the Confederate flag insignia. After the amendment passed a test vote, Moseley Braun took to the Senate floor. She argued that putting the Senate’s “imprimatur” on a racist symbol was an “outrage” and “insult” that was “absolutely unacceptable” to her and millions of Americans both black and white. Her speech was described as an “oratory of impassioned tears and shouts” and she threatened a filibuster. At the end of a three-hour debate, the amendment failed. Commenting on this example, Gutmann and Thompson write: “even extreme non-deliberative methods may be justified as necessary steps to deliberation” (p. 135). Yet they also point out that her appeal might not have succeeded if it had been “purely strategic, asserting only a claim of interest and making no appeal to moral principle” (p. 258). That is, if she had made the issue a matter of bargaining or accommodation to ensure the interests of African Americans as a group, rather than making a moral appeal, based on justice, she would have been less effective. Yet Moseley Braun cannot have been unaware that the interests in re-election of the Senators who initially opposed her were part of what made them yield. In this case, deliberation, negotiation, and activism combined to generate a resolution. Choosing among these practices, then, is not only not required, but also not a good idea. Each has its place in the repertoire of a democratic citizen.

The goal of democratic education for both teachers and teacher educators might be to educate citizens who would realize the following ideals, as represented by Walzer’s (2004) thought experiments:

We can imagine the party platform drawn up by a group of people who are not only good negotiators but reflective men and women aiming at proposals that are morally justified and economically realistic as well as politically appealing. We can imagine a negotiating process in which people try to understand and accommodate the interests of the other side (while still defending their own) rather than just driving the hardest possible bargain. We can imagine parliamentary debates where the rival
speakers listen to one another and are prepared to modify their positions. And finally, we can imagine citizens who actually think about the common good when they evaluate candidates, or party programs, or the deals their representatives strike, or the arguments they made.

(Schooling and the Fostering of Democratic Practices)

Even if my argument is persuasive that democratic citizens need the dispositions, knowledge, and skills required to participate in the practices of deliberation, negotiation, and activism, that fact does not settle the question of what the roles of public schooling and higher education are in developing these capacities. Closest to the heart of the current curriculum of education at all levels are aspects of the practice of deliberation. Fostering capacities for rational persuasion is simply part of what a good liberal education involves. Even without aiming at civic education, universities will enhance the civic virtue of their students, including prospective teachers, simply by developing the knowledge, attitudes, and skills required for serious inquiry. By teaching students how to engage in the search for truth, they will enhance the quality of public reason. As Dewey often argued, inquiry is not the sole provenance of a special class of persons called “researchers,” but is both the right and the duty of democratic citizens.

Thus liberal education has significance for democratic life. And the inequality of our current system that denies a strong liberal education to some citizens is not only unjust but also undermines democratic participation. Yet acquiring knowledge of the liberal arts does not in itself foster willingness to listen to others’ points of view, openness to being shown wrong, or willingness to modify one’s understanding in light of new evidence—the virtues required for genuine deliberation. Thus democratic education requires more explicit attention to virtues often thought to be embedded in the curriculum of liberal education, but surely not always realized.

The place of the knowledge, attitudes, and skills associated with negotiation in the curriculum of schooling at all levels is less secure than those associated with deliberation. While there are programs for teaching students and their teachers conflict resolution techniques, as noted earlier in this chapter, these practices are not as deeply embedded in the educational curriculum of either public schooling or higher education as the practices of deliberation. I have suggested that it may be that suspicions about the morality of bargaining as opposed to deliberation may be part of the explanation. But it may also simply be that these techniques are thought of as “add-ons” that are less central to the educational missions of schools at all levels. But the enduring reality of disagreement in democratic political life makes the willingness to accommodate others’ legitimate interests and the ability to devise creative solutions to conflicts important democratic virtues. If the educational system does not foster these capacities, what other institutions will?

Fostering a commitment to social justice and social activism within schooling has been controversial, as noted earlier in this chapter. Some question whether schools of education, or universities more generally, should make commitment to social justice and activism a part of the curriculum. Stanley Fish (2004) has argued that urging students to engage in political acts, even fostering “the practices of responsible citizenship,” is not the business of the university. “Universities,” he writes, “could engage in moral and civic education only by deciding in advance which of the competing views of morality and citizenship is the right one, and then devoting academic resources and energy to the task of realizing it.
But that task would deform (by replacing) the true task of academic work: the search for truth and the dissemination of it through teaching” (n.p.). Further, some worry about the prospects of indoctrination. While classifying himself as within the radical democratic tradition, Schwartz (1995) nevertheless claims:

A pluralist democrat would argue that schools should impart a minimalist democratic ideology to students involving a capacity for critical reasoning (even about democracy itself) and a commitment to the equal rights of democratic citizens. To inculcate a thicker, more comprehensive political ideology would cross the line between democratic schooling and ideological indoctrination.

So there is contestation about the role of schools in promoting activism.

Yet social criticism has long been an established part of the university’s function in American society. And while there are legitimate disagreements about what justice requires, that teachers in a democratic society should be committed to a just distribution of educational resources does not seem an inappropriate expectation. More challenging, but also clearly necessary for democratic life, is creating awareness of systematic injustice and the role citizens play in perpetuating it, even without being aware of their complicity. Of course, the line between democratic schooling and ideological indoctrination can be crossed. But teachers who have acquired the deliberative capacities described above will be better able to draw that line.

Deliberation, negotiation, and activism are all possible stances for democratic citizens to take. A case can be made that these practices are rightly fostered through the educational system. The commitment to developing citizens who can participate in these practices sets a complex agenda for teacher education. As I have suggested in this essay, teachers in a democratic society should be able to: lead deliberative discussions where students learn to formulate their own arguments, engage others’ points of view, and be open to changing their minds when given good reasons to do so; teach the skills and attitudes of negotiation that include the willingness to accommodate others’ interests in ways that do not deny fundamental democratic principles, as well as the ability to generate creative solutions to conflicts; and encourage students to be alive to injustice in social practices as well as in themselves and others and to be willing to challenge injustice when they see it.

It should be plain from the discussion thus far that the democratic practices considered in this chapter are more than mere sets of skills. They have ethical dimensions that involve qualities of character and attitudes toward other participants that are required to make them constitutive of democratic practices (Grant, 1996). Mere training in skills of conflict resolution, for example, will not necessarily foster willingness to accommodate others’ interests. Thus democratic practices cannot be communicated in a few training workshops. Rather, the whole educational process in teacher education programs as well as in K-12 education must provide forums for the reflective appropriation of these practices.

The limited success of effects to “export democracy” shows that learning and teaching the practices of democratic participation are not simple matters. Children need to experience these practices as part of a democratic political culture if they are to fully develop the complex “habits of the heart” that sustain democracy. As Dewey (1966/1916) noted, “the main texture of disposition is formed, independently of schooling” through the “unconscious influence of the environment” (p. 17). On the other hand, schooling is not inert: it provides “a special social environment which shall especially look after nurturing
the capacities of the immature” (Dewey, 1966/1916, p. 22). Schooling that consciously fosters democratic practices makes its contribution to revitalizing and improving democratic life.

A CONCLUDING POSTSCRIPT: HIGHER EDUCATION, TEACHER EDUCATION, AND CIVIC EDUCATION

Teacher education is located within colleges and universities that have increasingly embraced a role in civic education. A few years ago 500 university presidents called upon colleges and universities to help students “realize the values and skills of our democratic society” (as cited in Fish, 2004). Many colleges and universities include a commitment to civic education within their mission statements. Indeed Fullinwider and Lichtenberg (2004) claim that higher education’s understanding of the benefits of liberal education has shifted from acquiring liberal culture to preparation for social and civic engagement (Chapter 3).

Yet the university’s capacity to play a role in civic education depends on its protecting its institutional autonomy. To maintain its social roles as truth seeker and social critic, the university needs the capacity to speak truth to power whatever the dominant sources of power are at a given historical moment. While contemporary university scholars attack the injustices embedded in our social and political life, universities as institutions are increasingly connected to the agendas of state governments and corporations.

The Martin Luther King Day dinner at my university is held in the campus’ main athletic facility. It is a large event and some people have distant views of the stage and the speaker, so the instant replay screen normally used for athletic events is pressed into service. At a recent dinner, during the opening moments, old television footage of the civil rights movement was projected onto the screen, which is surrounded by advertisements for several corporations. I found it a disquieting moment to view images of nonviolent protesters being beaten by the police in juxtaposition with the advertisements. Later the image of our speaker, President Ruth Simmons of Brown University, was on the same screen. As she challenged our students to be less concerned with Hummers and bling-bling and more concerned with social justice, the advertisements surrounded her face.

That image stayed with me as a metaphor of the moral and political challenges facing contemporary universities. Examining the curriculum and the education provided to students is only one part of the civic mission of higher education. Universities—and that includes colleges and schools of education—need to examine their own actions as corporate agents for consistency with maintaining the ability to speak truth to power and their role as civic educators.

I am not saying that it is necessarily wrong for universities to have corporate sponsors for their enterprises. Nor am I saying that business is necessarily a morally contaminated activity from which universities should keep their distance in order to maintain purity. But universities do need to think hard about structuring government and corporate partnerships in ways that do not compromise their essential roles as truth seeker and social critic. Without returning to the idea of the university as an ivory tower, unengaged in the affairs of the community, it is important to maintain institutional autonomy if universities are to fulfill their civic role. That role includes the preparation of the nation’s teachers who can help our children and youth develop the arts of deliberation, negotiation, and activism.
REFERENCES

To identify an occupation as a profession minimally describes a community in which autonomous members see themselves in practical service to individual clients and to society, a practice which requires the use of judgment on the basis of a body of scholarly knowledge and professional experience (Jackson, 1970; Hoyle, 1980; Sackett, 1990, 1993; Shulman, 1998). The two concepts of service and knowledge imply that a profession has both moral and epistemic purposes. The ideal of a profession furthermore implies that the community is self-governing, primarily through determining admission criteria, with a code of ethics backed by sanctions including expulsion from the community. For an occupation to achieve this status demands a process of professionalization in two major ways: first, it must continually enhance its professionalism, i.e. the quality of its service and of its knowledge, and second, it must seek public recognition of its merits through appropriate financial rewards, autonomy and respect, i.e. its occupational status.

The moral and epistemic purposes of teacher education are therefore critical not only in enhancing the quality of practitioners in teaching, but also in contributing to the development of the public status of the occupation of teaching, for, as Sullivan (2004) reminds us, “... professionals are inescapably moral agents whose work depends upon public trust for its success.” Most entrants to the profession are now graduates in the liberal arts or sciences and can be assumed to have developed some habits of critical inquiry germane to their field of study, although, like many serving teachers, they may have been given only a weak and intellectually uncritical base in educational theory (Clifford & Guthrie, 1990; Goodlad, 1990; Griffin, 1999). Yet though teacher education is by definition parasitic on the practices of teaching, there is little shared professional identity or equivalence of status between the practitioner and the academic. Indeed not all academics in education units of higher education institutions have responsibility for programs of teacher education, and many of those that do see themselves driven only by the research purposes of the academy (Clifford & Guthrie, 1990; Goodlad, 1990), where they enjoy the professional status of the academic. Yet these institutions have begun to feel the thrust of federal and state policy in the last decade to increasing teacher quality, and the accrediting organizations have become more tough-minded with the aim of improving the professional quality of graduates (NCATE, 2002; TEAC, 2005).

The professional aspiration for teaching is thus intertwined with the practices of teacher education, but in terms of autonomy, an ideal of service or self-government the aspiration may be chimerical. First, the autonomy of the profession may be anachronism because public and political control increasingly dominates the work of the public school teacher, and such talk seems meaningless or merely rhetorical, especially in the context of high-stakes testing. Second, the ideal of service, set out in the Anglo-American ideal (Jackson, 1970) has been corrupted. Fareed Zakaria (2003) argues that “professions
are the shadow of their former selves. They have been crushed by a pincer movement with the market increasing competition on one side and the state on the taking over many of the functions of professions and private business” (p. 222). Third, the ideal of self-government with sanctions based in a code of ethics is equally out-of-date. Some professions seem unable or unwilling to police their members effectively, notoriously in the pedophilia scandals among Catholic clergy made public in 2003, with egregious behavior stretching back three or four decades. For teaching, without any apparatus for professional policing, instances of teacher malefascence are ignored. Teacher unions have other priorities and show little enthusiasm for sanctioning incompetent or wayward teachers, thereby casting doubt on whether the occupation of school-teaching is prepared to develop the institutional muscle needed to be regarded as a profession. The call for professionalism and professionalization in teaching may not therefore be practical, even if it were coherent.

If these three constituents of what we understand as criteria of a profession, namely autonomy, service and self-government are so fragile in the contemporary social context, how is the fourth essential element, a knowledge base for practice, to be regarded? A quite different line of criticism about teaching as a profession comes from those who regard the notion of there being education-specific specialist knowledge as mistaken. Educational research and teacher education as currently practiced is viewed as a doomed enterprise (Hirsch, 1996; Finn, 1991; Ravitch, 2000) because it has embraced unsound epistemologies, neglected what is regarded as the palpable need for education in a traditional framework of knowledge with its Platonic and medieval origins, and complicated the teaching task with illusions of technique based on science (Regnier, 1994) rather than accepting it as a task of initiating children into the life of the mind and developing wisdom and virtue through knowledge of content.

Yet while this is the most politically developed and well-known line of criticism of the profession having a distinctive knowledge base, it should not be viewed just as ideological chatter. It is one relatively small part of a profound and widespread controversy among those academics and politicians interested in matters of both moral and epistemic purpose in teaching and teacher education in particular. At the root of such controversy is the fundamental but complex three-legged conflict of purpose: Is education (a) a vocational and socializing endeavor, or (b) for the transmission of knowledge and culture, or (c) focused on the development of the individual (Egan, 1997; see also Bruner, 1996, Chapter 3)? Viewed as epistemological, this three-way conflict indicates that talk of the knowledge base of teaching as a body of scholarly knowledge for a profession is a minefield of epistemological controversy, with positivists, post-positivists, objectivists, post-modernists, feminists, constructivists, and pragmatists, each vying for dominance in research and school curricula. Viewed as moral, the conflict finds Platonists, Aristotelians, Kantians, Deweyans, Buberians and various kinds of existentialists pitted against each other in terms of their moral perspectives on society, the individual, his or her moral development and place in society, with the differing emphases in moral language (e.g. duty v. virtue) which that implies. Clearly a coherent knowledge base for the profession of teaching could not be an amalgam of such severely conflicting moral and epistemological viewpoints. In this respect, teaching is unlike medicine where there is a scientific epistemology that dominates that profession, marginalizing those with claims to alternative healing powers or therapies, such as homeopathy, which lack the widely accepted authority of the testable empirical base. Professional medicine, it should be noted, goes to some lengths to keep out those it regards as outside this epistemological tradition: chiropractors or acupuncturists need not apply.

While it is not possible here to give comprehensive attention to the heterogeneity of
perspective on moral and epistemic purpose in education, it must be constantly recognized that this diversity forms a necessary and perplexing background for the idea of teaching being a profession, a matter not solved, in my view, by declarations that this or that somehow constitutes the knowledge base, as if consensus were all that were needed. To illustrate the characteristics of this diversity in this essay, I articulate four models of teaching from amongst a plethora of choice, each of which implies how teacher education should be conducted. Each also has a different emphasis in terms of the three-way paradigm of educational purposes and each, in my view, has a strong claim in principle for providing an account of moral purposes and the knowledge base for teaching.

FOUR MODELS OF MORAL AND EPISTEMOLOGICAL PURPOSES IN TEACHER EDUCATION

The justification for this approach through models is two fold. First it is grounded in the belief that teacher education in general needs a much more rigorous examination of the moral and epistemological underpinnings of practice, if the professional aspiration is to be coherent. Teacher education programs must be grounded philosophically and driven by intellectual rigor in their construction (Sockett, 1993). Second, in so far as the drive for professionalism is not merely an interest of the research community but a target many practitioners might embrace, that would seem to necessitate some form of consensus and agreement. That putative consensus would describe how the profession manifests the varied elements of being a profession, such that the agreed elements provide criteria of “correctness” upon which strong guidelines for “proper” professional teacher education praxis can be constructed. But can consensus exist without ignoring or obscuring profound moral and epistemological issues, and marginalizing significant perspectives on the professional aspiration, treating constructivists as chiropractors or Aristotelians as acupuncturists? Opening up different kinds of models, though it cannot be complete, may serve to promote that profound moral and epistemological debate and the question of whether consensus is viable. Certainly one possible outcome is that there could be several coherent models of teacher professionalism, with differing moral and epistemological underpinnings, and the level of consensus between them limited. Diversity in describing teacher professionalism, it might emerge, should be welcomed and consensus eschewed.

The four models I will articulate through the main body of this chapter are described in terms of the professional teacher’s moral and epistemological stances. They are:

a the scholar-professional
b the nurturer-professional
c the clinician-professional, and
d the moral agent-professional

A model here is seen as an ideal type, with the label acting as a rough and ready descriptor of emphasis, and not carrying exclusivity, i.e. (d) does not mean that (a), (b), or (c), individually or severally, lack a moral perspective. How in general might such models be articulated? One could pick out, say, the central tenets of Dewey’s moral and epistemological stances to education, including other scholars in this tradition, and describe therefrom a Deweyan model of teacher education (see, for example, Dottine, 2006). Different institutions using a Deweyan model would not be in lockstep, any more than those using a Christian model would be. Rather there would distinctive interpretations and practices, rooted in a common adherence to the central tenets of the Deweyan model.
Other institutions might display elements of the Deweyan model, say in terms of Dewey’s emphasis on democratic society, but not carry the whole model through their practices.

A different approach to this description of a model which begins with a theorist, would be to look at practice and seek to build a model from different elements of practice, e.g. how children learn, the teacher’s responsibility, managing a classroom and so on, notwithstanding that such observations embody theoretical frameworks. So, as will be seen in the clinician-professional model (see pp. 54–59), practices may vary in their moral and epistemological frameworks but their coherence as a model rests on some form of consensus about specific moral and epistemological positions set within an overarching ambition, in this case, of professionalism. Once again, there will be differences between the scholars, just as there are between institutions, in the theoretical articulation of the model, and in the extent to which they adhere to the central tenets of that model. Both these approaches to the characterization of models are used here.

However, a model of teacher education presupposes a picture of a good teacher. What counts as “good” is culturally and morally heterogeneous. Socrates, Aristotle, Jesus of Nazareth, Mohammed, Saint Thomas Aquinas, Confucius, Jean-Jacques Rousseau and Julia Child each provide us with glimpses into different aspects of teaching quality, not forgetting such literary heroes as Mr. Chips, or those men and women celebrated across the nation with different forms of good teaching awards and by success, for example, in the standards elaborated by the National Board. Models reveal differences in the conception of the “good teacher.” The four models described here are, to repeat, not exclusive. They are articulations of distinctive moral and epistemological positions on teacher education: they are therefore both models of practice and also models for practice. (While each model cites specific authors, it should not be assumed that all features of a model are exclusively that scholar’s or that the named scholar is only to be associated with that model.)

The scholar-professional
This first model regards knowledge as the purpose of education, so that the teacher is dedicated to imparting wisdom and fostering the life of the mind (Oakeshott, 1967, 1975; Hirst, 1972; Barzun, 1991). Moral purpose here is a matter of traditional, even conventional virtue. Epistemic purposes for teacher educators and teachers will not simply be focused on what is regarded as the unique character of disciplines (e.g. History) or inter-disciplines (e.g. Classics) being studied, but will also focus on epistemological battles within disciplines and on the nature of knowledge, perhaps with some attention to what has come to be called pedagogical content knowledge (for a recent account of this, see Grossman & Schonfield, 2005).

The nurturer-professional
The second model is primarily focused on the development of the individual. It describes a teacher whose primary focus is on relationships with children: as Noddings (1984) puts it, the child is infinitely more important than the subject. It interprets the parent of in loco parentis as the mother. It can encompass such perspectives as Van Manen’s (1991) with his emphasis on intuition and the “personal embodiment of a pedagogical thoughtfulness” (p. 9). In other iterations (see Belenky et al., 1986), as teachers educators work with novice or serving teachers, both moral and epistemological purposes are connected to individual development. Throughout, the emphasis is on individual nurture: care or tact demands self-understanding of the teacher and the cognitive is subsumed within the affective.
The clinician professional

The third model starts from an account of the work of the professional public school teacher in a democratic society, emphasizes the teacher’s adaptive expertise, with moral emphases geared to social purposes, such as social justice with socialization as the educational aim (see, for instance, Darling-Hammond & Bransford, 2005). Its epistemic character is a strong if guarded belief in the integrity of educational research as a social science with explicit assumptions about knowledge, truth and belief, and the significance of the scientific method (see, for instance, Phillips & Burbules, 2004).

The moral agent-professional

The fourth model accepts the legitimacy of the three conflicting educational purposes and regards none as having priority since its focus is on teaching as primarily, predominantly, and pervasively a moral activity (for example, see Tom, 1984; Hansen, 1995, 2001; Campbell, 2003). Although Aristotle and his followers provide the ethics of virtue examined in this essay, the model would have different interpretations dependent on the ethic depicted; e.g. that of Kant or Dewey. Social and moral in education are a fortiori epistemic purposes, in the Aristotelian tradition, uniting moral and intellectual virtues (Norton, 1991; Williams, 2002). The model describes the individual teacher with a primarily moral purpose focused on the child’s comprehensive development and growth, and its epistemic purposes, for teachers as well as children, are to integrate academic content with intellectual and moral virtues, such as accuracy, consistency, courage, and open-mindedness.

Each model can now be examined in turn.

THE SCHOLAR-PROFESSIONAL

The education of the scholar-professional consists primarily in an intellectual endeavor which will enlighten his or her teaching of a discipline within an academic curriculum in schools. Ravitch writes of this as

the systematic study of language and literature, science and mathematics, history, the arts and foreign languages: these studies, commonly described today as a “liberal education” convey important knowledge and skills, cultivate aesthetic imagination, and teach students to think critically and reflectively about the world in which they live.

(p. 15; see also Finn, 1991, p. 252)

The nineteenth-century English Cardinal John Henry Newman argued in The Idea of the University that “Liberal Education, viewed in itself, is simply the cultivation of the intellect, as such, and its aim is nothing more or less than intellectual excellence” (see Pring, 2004: 43). Philosopher Allan Bloom (1987) has a different emphasis: a liberal education, he argues, means that students seek to investigate the question “What is man?” “in relation to his highest aspirations as opposed to his low and common needs” (p. 21). The life men lead and the cultivated intellect which helps them in their respective quests implies that “the proper and effective exercise of reason must take place against the background of inherited forms of thought and experience” (O’Hear, 1994: 20), which Oakeshott (1967) has described both as modes of experience and as the
different conversations of mankind. Education, Peters (1966) argued, is initiation into “worthwhile activities,” i.e. those forms of thought developed across the centuries. This general culture provides the basis for scholar teachers to illuminate the particularities of their professional work.

The moral purposes of the education of a scholar-professional are therefore classical, historical, and conventional; acquiring knowledge to become more virtuous, thereby yielding good members of a democratic society. Ravitch makes the important claim that as the academic curriculum lost its importance in the twentieth century, schools lost “their intense moral commitment to the intellectual development of each child” (p. 16, my italics). Such a child would be guided by a scholar-professional toward intellectual autonomy, which will inform moral choice through the human issues embedded in the content and the intellectual and moral virtues needed to address those issues seriously. Understanding such a complex character as Claudius the King in Shakespeare’s *Hamlet* or Raskolnikov in Dostoevsky’s *Crime and Punishment*, for instance, is to learn of human guilt and responsibility. Differently, grappling with calculus is not merely finding answers to problems, but coming to value accuracy and the unremitting struggle of handling success and failure. The moral purpose of the “engagement,” as Oakeshott (1975) describes education, is to enhance individuality of expression and thought rooted in traditional modes of experience, and to find ways to examine a student’s success which facilitates the teacher’s discovery of that individuality. The life of the mind is a (moral) good for its own sake, and the educational task is primarily to develop in children an intrinsic motivation for it, eschewing such external motivations as a good career. Such moral claims, heavily disputed then as now, were exemplified in a continuing debate based on the contest between C. P. Snow (Snow, 1998, 1959) and F. R. Leavis (1962) who argued the relative moral merits of the sciences and the humanities. The education of the scholar-professional however places firm moral emphasis on the “scholar” who will likely use the models of intellect he or she has experienced, and fashion a professional persona therefrom.

That the scholar-professional is today something of a rare breed is indicative of the wide range of criticisms that have been leveled at knowledge and the life of the mind as a moral purpose for education. It has been seen as elitist, historically developed to create leaders, irrelevant to modern life, lacking in instrumental purpose, and based in an outdated epistemology, each of which criticism was reflected in the debates about the Western Canon (Bloom, H., 1994). Even those who are its advocates (e.g. Hirsch, 1996, 1987) now provide instrumental arguments for the life of the mind, such as being able to read the Science columns in the *Washington Post* (Hazan & Trefil, 1991) rather than the intrinsic justifications apparent in Newman.

Its epistemic purpose, however, is to develop teachers who see themselves as scientists, historians, philosophers, geographers etc., who teach their discipline, not merely deliverers of perspectives on these disciplines. In that sense, the identity of the school teacher with the academic community is strongly sustained. (A paradigm example of that identity is William Everdell of St. Ann’s School Brooklyn, who in 1997 published *The First Moderns*, a widely acclaimed 800 page book of cultural analysis of the turn of the twentieth century.) Intellectual discipline is the pre-occupation of the scholar-professional: it takes a form both specific to a discipline (e.g. methodology in science), and fosters the emergence of attitudes and propensities, capacities and virtues germane to the life of the mind, including a “fanaticism for veracity, which is a greater possession than much learning . . . as the moral nature of man is greater than the intellectual; for veracity is the heart of morality” (Huxley, 1874).

Disciplines, on this model, are the primary influence on teaching with different types of
influence dependent on the methodology of the discipline. Science teaching will be experimental—in a laboratory or field, philosophy will be taught in seminars, history will demand work on primary sources, often with implications for the acquisition of another language, all of which will be reflected in teacher education. Scholar-professionals will thus see themselves as working within a tradition of inquiry, into which they have been initiated as children and as scholars, which may account for what is perceived as the inherent conservatism of this model.

Becoming a scholar-professional therefore demands both a rigorous understanding of one or more disciplines from within, and being active in the raging epistemological controversies that many disciplines offer. For the life of the mind means immersion in controversy and uncertainty, rather than consensus and certainty, with implications both for teaching and teacher education. It is not clear, for example, whether there is a consensus about the teaching of mathematics, since arguments about math teaching seem to be settled more by political fiat than philosophical consensus on the nature of mathematics (see LePage & Sackett, 2002, pp. 21–36). English teachers in the United States too “cannot seem to agree on a definition of the subject-matter” (Darling-Hammond & Bransford, p. 211), and, “there are many competing definitions of social studies, some of which feature the importance of history, whereas others stress the centrality of civics” (p. 209). Familiar too are the disagreements among historians, geographers and political scientists or indeed commentators who deplore the dissolution of literature in language arts and history into social studies.

There are at least three kinds of epistemic conflict for the scholar-professional to enjoy. First, there is frequent dispute about the central characteristics of the discipline. In the case of history, while methodologies may not differ much, political perspective does: compare the work of Howard Zinn or Eric Hobsbawm with David McCullough or Shelby Steele, as well as pervasive debate about an emphasis on social history and social movements or individual heroes. Second, there is disagreement about the merits of different potential topics to be taught, e.g. Chaucer v. J. D. Salinger, partly exemplified, once again, in debates about the Western Canon. Third, however, the most pervasive contemporary struggle is one deeply rooted in the claims of postmodernism which simply rejects the view of knowledge represented in this tradition of distinctive disciplines as the source of all scholarly knowledge.

The scholar-professional may sympathize with Shulman’s (1987) comment that “Effective teachers know much more than their students, and more than good pedagogy. They know how students tend to understand (and mis-understand) their subjects; they know how to anticipate and diagnose such misunderstanding; and they know how to deal with them when they arise,” and they may seek to emulate it. Course content will focus on how to achieve what Bruner (1963) called “courteous translation” in the belief that the basic principles of a discipline are available to all, a principle espoused by those who teach Philosophy to young children (see Lipman, 1988). Yet the scholar-professional may not read much non-subject-based educational research, as teaching is seen as a common engagement for teacher and learner with the subject: indeed, in some cases notions from educational research, e.g. developmentally appropriate practice, are trenchantly criticized and dismissed (see Matthews, 1994).

Since the publication of the Harvard (1942) Report General Education in a Free Society notions of common intellectual or “communicative” skills, or the “general powers of the mind” have become an alternative currency to that of the discipline. Benjamin Bloom and his colleagues (1972) boosted this psychological conceptual approach to knowledge, driven by the measurement of outcomes. The scholar-professional resists such conceptualizations of the curriculum, for such skills, they argue, have to be located in a
disciplinary base: “Analyzing” in history, for instance, is so far different an intellectual exercise from “analyzing” in chemistry (see Hirst, 1972) that talk of the ability “to analyze” as a general power of the mind is just muddled. Thus the approach to a curriculum of teacher education for this model would be firmly located in a discipline and the belief that developing intellectual power in a disciplined framework itself provides intellectual virtue, and that moral virtue will inevitably follow.

THE NURTURER-PROFESSIONAL

The nurturer-professional is focused on the individual and on personhood but primarily on the relations between the child and the teacher. It would be mistaken to assume that this is just one of the many classic models of that view of the purposes of education which is “child-centered.” The European tradition includes Rousseau, with the emphasis on the uninhibited development of the child, Froebel with the emphasis on play in the child’s garden (the kindergarten), Makarenko with his attempts after the 1917 Russian Revolution to build communal school government with orphans, and A. S. Neill with his puritanical zeal for the removal of authority in the child’s life. The American tradition comprises mavericks such as Homer Lane, a follower of Neill, the innovator Jane Addams, and influential pioneers such as W. H. Kilpatrick and his Project Method. Dewey too wanted public education to provide an education determined, in a complex sense, by a child’s interests and capacities, but his educational perspective is set firmly within his project for democratic society. The corpus of Dewey’s work, in Alan Ryan’s memorable phrase, is a “gospel for democrats” (Ryan, 1996, p. 31).

Many different types of educator used to define the moral role of the teacher professional as in loco parentis, although it is now viewed as an untenable idea of the professional role primarily because it has largely been replaced by due process in teacher-parent relationships. The model of the nurturer-professional, however, is singularly distinctive in the child-centered tradition in that it puts the figure of the mother at the center of a revitalized concept of in loco parentis. Not the neutral “good parent,” not the father or the mother, but the mother. Notwithstanding its ancestry in child-centered education, this model is rooted firmly in the feminism of the second half of the twentieth century, developed by Betty Freidan and others. However, it is to Carol Gilligan that belongs the original development of a feminist understanding of education through her important thesis that women did not think about moral issues in terms of rules and principles, but in terms of relationships. This was a strong gender-based counterpoint to an ethic of rules derived from Kohlberg’s interpretation of the central moral principles of classical liberalism (Gilligan, 1979, 1982; Gilligan & Attanucci, 1988). Numerous and significant additional steps have since been taken by feminist scholars (e.g. Belenky et al., 1986), some of whom have articulated the sense of moral purpose in education focused on the child, not on the individual teacher or parent caring for the child. The moral focus in this nurturer-professional model is therefore on motherliness, the relationship between what Noddings calls the one-caring and the one cared-for, with acknowledged philosophical roots in the “I–Thou” work of Martin Buber (1970). So justice, especially social justice, is not thought of in this model as detached or paternal with desired social ends, but as maternal, with the receptivity, relatedness and responsiveness characteristic of caring, an extension of Gilligan’s line of thought (Noddings, 1999).

Centering the moral in relationships focuses on how “we meet the other morally” (Noddings, 1984, p. 5) and on the uniqueness of human encounters. It is empirically
obvious, but worth indicating philosophically, that the experiences everyone has, including the challenges of caring-for and being cared-for are complex and highly intricate, often idiosyncratic, e.g., relationships within a family, with our children, our parents, or our siblings. From the inside, on Noddings’ view, for the one caring there is a displacement of interest from my own reality to the reality of others. I feel your pain, as it were. This goes well beyond a feeling of empathy, even beyond a sense of compassion: rather we see the other person’s reality in the perspective of caring as a real possibility for me. “I must make a commitment to act. The commitment to act on behalf of the cared-for, a continued interest in his or her reality through an appropriate time-span, and the continuing renewal of that caring are the essential elements of caring” are the demands of caring (Noddings, 1984, p. 16). For the one cared-for, on the other hand, the reception of the authentic attitude of the one caring transforms the relationship.

Three major concepts are at the core of this moral idea of caring on Noddings’ account. Receptivity defines a relationship in which both are open to the other, building a context of trust and understanding. Relatedness suggests the ability of both to fashion the relationship, to contribute to it, to have it grow, and responsiveness implies the readiness to commit to a relationship, whatever it brings. A similar orientation is found in Van Manen’s account of pedagogical understanding: “What could be more important than to have a sense of what things are like for a particular child and what is necessary to help young people to stand more fully, more strongly on their own two feet in a moral, aesthetic, social and vocational sense?” (1991, p. 83).

The epistemic purpose is also one of building relationships which presupposes knowledge of the disciplines. For the nurturer-professional embraces intellectual life, but seeks to move beyond the bureaucratic and technical framework of modern schooling, and places the desirability of relationships in the epistemic context (Noddings, 1984). Learning the disciplines (however they are to be construed) is therefore integral to learning how to teach, but each discipline has relationships with other disciplines. If we attend to what might be called the latitude and longitude of any discipline, we must not treat it as detached or impersonal, but to switch the metaphor, as part of the family of human understanding. Mathematics education should not therefore be perceived as detached from other types of study. For a comprehensive integrated understanding of that subject, explorations into history and philosophy will be needed. Any disciplined perspective can yield further understanding through the exploration of such relationships.

This epistemic purpose of the model is embedded in its moral purpose and suggests a still more extensive view of relationships and caring. We cannot appropriately understand a discipline and its constituents without caring for them and understanding their relationship with us. That human beings care and are cared for extends into the real world of the planet, its nature and the world of human artifacts: the dimensions of caring in the nurturer-professional model extend to all aspects of our world, plants, animals, works of art and, of course, disciplines or school subjects however construed. The model thus prescribes teacher education curricula which integrate discipline and pedagogy, implying that education specialists work consistently and jointly with, say, mathematicians, exemplifying the reach of relationships. Such ambitions are, in many ways, extremely exacting moral and epistemic purposes.

Yet, of course, it is this bureaucratic and technical framework of modern schooling that makes it difficult to imagine such a concept of the nurturer-professional gaining any credibility in public schooling. Due process has brought a legalistic view of what the teacher’s relationships should be with tougher accountability and systems of control. Due process undermines the centrality of relationships implicit in the model, and makes the character of the moral relationships demanded practically impossible to implement.
Using this model demands much more autonomy and freedom for the teacher than contemporary systems allow. Therefore, like radical child-centered education practitioners before it (Neill, Homer Lane, Makarenko) it may seem more easily fully deployed with children in alternative schooling, children who are delinquent or for different reasons outside the public school mainstream.

THE CLINICIAN-PROFESSIONAL

The clinician-professional model celebrates the development of teaching as a profession, with medicine being seen as the benchmark for its development. This model is articulated most clearly and recently in *Preparing Teachers for a Changing World* (Darling-Hammond & Bansford, 2005) which seeks to “codify the (scholarly) knowledge base for professional practice and standards for the work of practitioners” (p. vii). The conclusions and ideas “represent the considered judgments of a large number of experienced practitioners and scholars in the field of education” (p. 21). It may be regarded as the most widely accepted of the four models under discussion, in teacher education if not in teaching, and *Preparing Teachers for a Changing World* thus forms an appropriate source for this model.

The epistemic content of this model contains an extensive range of scholarly knowledge relevant to the professional aspiration. It includes basic research on how people (specifically children) learn, and the influences of different conditions, including teaching strategies on that learning (see Darling-Hammond & Bransford, pp. 40–88). It includes a focus on how teachers learn, especially those practices that influence student learning (see pp. 358–390) and it equips them to use developmentally appropriate practices (see pp. 88–126). In particular, research provides knowledge of learning in different social contexts and contributes strongly to understanding the development and the significance of language for students (see pp. 126–169). Curriculum in teacher education further implies knowledge of subject matter, pedagogical content knowledge, the skills and social purposes of schooling, on which basis the individual student-teacher develops what is called a curricular vision (see pp. 169–232). Teaching diverse learners, subject matter, managing and assessing learning complete the range of research topics and scholarly knowledge needed by a teacher educator and a novice student (see Chapters 7, 8 and 9, pp. 232–358). The teacher educator will thus need to follow the research on student-teachers’ learning particularly as the latter become “adaptive experts,” with the demands such expertise makes on the processes of observation, enactment and complexity (see Chapters 10 and 11, pp. 358–442).

Under the influence of the medical profession’s development, this extensive knowledge base is regarded as research-driven. So successful has this approach been from its initial formulation by Shulman (1987) that the primary emphasis in the practice of teacher education in the 1990s has been the development of this knowledge base (see for instance Reynolds, 1989; Murray, 1995). Thus a model built from this perspective on the profession and its knowledge-base is appropriately described as the (medically-derived) notion of the clinician, i.e., a person who reflectively uses research-based knowledge to inform practice, either by simply applying scientifically grounded conclusions somewhat like a technician, or more positively in making reflective judgments about research conclusions and their applicability to his or her own practice. However, given that the aspiration is a knowledge base for the whole profession, the broad comprehensive character of professional scholarly implies a search for consensus between epistemological positions. Both the moral and epistemological perspectives of the model can now
be elaborated and the status of this model requires more critical examination than
description.

**Moral purposes**

The moral content of the model is one in which a teacher forges his or her own identity
against the moral purposes of a democratic society. That identity has both common and
divergent purposes.

In common,

Teachers need to think about the subject matters they teach in a broader context that
includes an understanding of the social purposes of education, including the many
functions of schools—academic, vocational, social and civic, and personal—that
must be balanced in classrooms every day. In a democratic society, students must
also evaluate their teaching decisions against the goals of preparing students to be
equitable participants in a society that relies on interdependence. An important compo-

tent of preparing students to participate in democracy is to allow them to experi-
ence democratic classrooms and schools. This includes a commitment to eliminate
disparities in educational opportunities among students, especially those students
who have been poorly served by our current system. It also includes ambitious learn-
ing opportunities and, in today’s society, equitable access to the technological tools
that citizens need to succeed.

(Darling-Hammond & Bransford, p. 35; my italics)

This common emphasis is therefore on social morality, i.e. interdependence and equal-
ity of educational opportunities as a goal for classrooms and for the development of
learning communities in schools. Equality of educational opportunity is viewed as a
necessary constituent in matters of teaching diverse learners, and in the construction of
equitable classrooms. So, “The core purpose of formal education is to enable the devel-

opment of all children to take their place in adult society with the competencies to be
positively contributing members to the society (p. 125) for . . . curriculum goals are, or
should be, shaped by the requirements of preparation for citizenship in a democratic
society” (p. 170). The primary moral principles, as opposed to goals for schooling,
are those of distributive justice and equality of treatment, framed within a democratic
society, which serves to emphasize the “social perspective, that of the local community
as well as the broader society, not just an unconsidered personal perspective” (p. 175). Teacher education programs will thus emphasize issues of diversity and the complexity of
multi-cultural contexts for teaching, framed in a rhetoric of social justice.

From this common base, there is diversity: each clinician-professional will develop his
or her own identity and curricular vision. It is suggested, for example, that individual
teachers might see themselves as professionals, as scholars, as change agents, as nurturers
and child advocates or as moral agents. Forging this identity of their own “is an impor-

tant part of securing teachers’ commitment to their work and adherence to professional

Three critical matters arise from this characterization of the model’s moral purposes.
First, the model carves the teacher’s professional role out of the goals of a democratic
society: but it states these goals as if they were not controversial but certain, agreed upon,
and fundamental to the beliefs of the teacher in a democratic society. Yet, it is clearly not
a matter of general agreement in this society that social justice is more important than
individual liberty, or that the schools have to be vehicles for the former (see Brighouse,
2000 for an extended discussion of social justice). Indeed, whether parents should view schools as providing their children with public (i.e. valuing social justice) or positional (i.e. getting on a career ladder) goods or whether teachers should likewise view schools one way or the other depends on alternative conceptions of democratic society, its conflicting principles and the purposes of schooling outlined on page 4. Nor is equality of educational opportunity bereft of ambiguity and debate—in both concept and in application. Incumbent on teacher educators, it can be argued against the model’s certitude, is that their students get strong understanding of these disagreements and complexities in a democratic society upon which the specifics of a professional role can be based. Without that kind of understanding, teacher education on this model would short-change student teachers on the diversity of public and intellectual opinion and beliefs.

Second, the model describes teachers as building an identity for themselves on to the norms of the professional role and indeed sometimes the place of that moral identity seems like an afterthought: e.g. “Teachers will need a moral compass that enables them to follow through on their commitments for all children. This requires some explication of ethical issues that arise in teaching” (p. 173). If this interpretation of the model is correct, individual identity is secondary to the demands of the role. But moral identity is not like a good bedside manner, something to be acquired in dealing with patients as you get to know the ropes. How one performs in a role is dependent on profound moral beliefs and attitudes, not the other way round. In practice, too, student teachers should not be treated as a moral or religious blank slate on to which professional norms have to be etched. Students need, morally speaking, to be seen as individuals:

In terms of my religion, I am invisible. My professors, they look at me, see the color of my skin and think they know my story. I am African-American, I am Jewish. How can they see me if they do not know me? How can they teach me if they do not see me?

(Kazanjian, 1999, para 1, quoted in Sockett, 2006)

The demands of the role are secondary to the individual beliefs and attitudes which need to be educated and the quality of the teacher–student relationships implied for teacher education.

Third, a similar problem occurs in the relationship between promoting the goals of a democratic society and becoming a democratic citizen. That is, the strong emphasis on teaching in a democratic society risks neglecting the conceptually, if not logically, prior notion of what it is to be a democratic citizen, engaging with the kinds of inevitable controversies such a society welcomes. Commitment to independence, balance, social justice and equality of opportunity, seen as objectives for teacher education, should necessarily be premised on the student’s acquiring a sense of him or herself as possessing not just knowledge of the controversies for the sake of his or her job, but of those personal virtues and propensities characteristic of the democratic citizen. On Thomas Ehrlich’s (2003) interpretation, this means such intellectual virtues as truth, respect, openness, impartiality alongside the social-moral virtues of tolerance, reason, compassion, and alongside a core knowledge of ethical principles, necessary to being an effective citizen (Ehrlich, 2003: but see also Soder et al., 2000; Guttman, 2001). On this model, it seems, the teacher’s moral compass is at the periphery of teacher education. (It should also be noted, in terms of moral purposes, that such “individual” matters as the moral problems inherent in a teacher’s authority (see Peters, 1966) or the “manner” of the teacher (Fenstermacher & Richardson, 2001) are not seen as necessary to adequate functioning in the role.)
**Epistemological purpose**

The clinician-professional model describes professional practices rooted in research-based scholarly knowledge. Two significant matters rise from this account: (1) How does the clinician-professional justify or warrant what he or she does? (2) How does the clinician professional grapple with the epistemic complexity inherent in the model?

Research-based scholarly knowledge is defined primarily as empirical, often quantitative, with some recognition of a place for what is usually referred to as qualitative research. The empirical tradition in general assumes, (boldly perhaps in the knowledge that these epistemological matters are contested), that by knowledge is meant the beliefs (held by a person), the evidence (accessible to a person in justification of the beliefs held) and the truths (statements which the individual believes but which are independent of an individual). (For access to these discussions, see, for instance, Hamlyn, 1970; Zagzebski, 1996; Lehrer, 2004; Phillips & Burbules, 2000.)

The epistemic purpose of teacher education will therefore be to acquaint novice teachers with the findings of such research, which becomes theory for use in their practice (hence the notion of the clinician applying, with more or less skill and judgment, what the research and scholarship reveals). However, to be serious about the clinician-professional having knowledge, mere acquaintanceship will not be enough. For emphasizing knowledge of scholarship and research in the tradition, rather than, say, knowledge as an epistemological construction (see Phillips, 2000), is to require that the clinician-professional accept as true findings from the range of research work of specific relevance to the practical arts of teaching and to have the evidence for the truths such that the hypotheses which are the subject of the knowledge claim can in principle be falsified. Such capacity is needed in order that practices dependent on that knowledge can be warranted. However, the model does not seem to be clear as to whether scholarly theories function primarily as a set of prescriptions for action, or as hypotheses to be tested in action. This is a distinction made familiar by Bruner in his distinction between knowers, who follow prescriptions, and seekers who challenge hypotheses.

The model thus contains ambiguity, at least in the Darling-Hammond and Bransford iteration, as to the relationship between the clinical-professional and the scholarly knowledge acquired. There seem to be three possibilities: (a) that the teacher simply applies whatever “the research says” should be done, like a skilled technician; (b) that the teacher can appraise the effectiveness of the ideas, learn from them, and adapt them to practice, like a skilled knower, or (c) that the teacher is able to use scholarly knowledge, and understand it in such a way that he or she can test the conclusions of the research, and maybe falsify it, since the knowledge will be seen as testable hypotheses, not conclusions to be followed, like a skilled seeker. The professional ideal would suggest (c), primarily because of the professional autonomy it implies for teachers to be able to warrant autonomously their actions effectively rather than simply pointing to the authority of research.

For the clinician-professional model does imply teacher autonomy as the ideal. Its general respect for reflectiveness in teaching leads toward (c), i.e. in the same direction for the resolution of the ambiguity. Reflectiveness goes beyond mere puzzlement or giving the matter a bit of thought, into careful reflective examination, not just of practices themselves, but of research on teaching itself (see Schon, 1986 for an alternative way of understanding professional action). This will extend to understanding the relationship between individual values and teaching, and looking for the ways in which teachers may interpret situations in classrooms and schools with open-mindedness and objectivity. To be a reflective teacher suggests preparedness to embrace spirited inquiry into the
foundations of one’s action and what empirical research and values-inquiry suggests and which can falsified. The central characteristic of teacher reflectiveness will be a research-driven characteristic, that is, to be critics of scholarly knowledge and to hold their beliefs in such a way that the practices they deploy are seen as hypotheses constantly being tested (see Phillips & Burbules, 2004), an impetus familiar from the Teacher-Researcher Movement.

In addition to the problem of warrant, the model’s comprehensive range of research suggests epistemic complexity. While it is clear that drawing on a vast body of scholarly knowledge and in different idioms is a major challenge, one politically charged example of the complexity is the specific problem of the relation of fact and value and what that implies for teacher education. In the normative business of education the clinician-professional will be able to examine and critique the research knowledge being offered for use, and be able to make judgments about the application or develop skills related thereto. Teacher education must thus provide for detailed examination of values and norms, not just empirical research, and mastering this complexity will contribute towards justifiable warrant. The model’s stance towards the goals of a democratic society (see pp. 21–22) does not indicate that serious normative inquiry is essential.

Yet, the clinician-professional is commonly presented by politicians, administrators, principals, parents and teacher educators with policies or programs purportedly based on “what the research says” which does not articulate the value-laden nature of the enquiry (and is often about as reliable as “History tells us”). Research conclusions (especially on controversial topics like whole language or phonics, the teaching of mathematics, even class size) frequently vary depending on the political and social perspective which underpins the researcher’s (and thence the politician’s or administrator’s) arguments, indicating that conclusions in educational research, as in social science generally need to be approached with some caution. Not being able to face up to such complexity may leave the teacher ill-equipped to provide satisfactory warrant, i.e. where research conclusions are not empirically pure, with embedded norms and values left unexamined. This suggests that in teacher education, research and its conclusions will need to be examined not just as fact-based empirical research, but also in an idiom appropriate to values.

This example points up the problem:

. . . In contrast to earlier views of development as a set of biologically related stages clearly determining what students can do, current research shows that development, knowledge and learning are related to one another. The older belief that development proceeds at a fixed pace that determines children’s “readiness” for learning is no longer accepted by current developmental theorists. Instead research demonstrates how learning can affect development, as well as the reverse. New studies show that, in addition to their age or apparent “stage,” people’s prior knowledge and experience with specific content affects the sophistication of their thinking.”

(p. 93)

The widespread use in teaching young children of the notion of developmentally appropriate practice will require both examination of the empirical side of the research and of the value-systems which determine what counts as development in a teacher education curriculum. Development is not an incontrovertible notion in human growth, like homeostasis, i.e. something to be understood solely through scientific endeavor. Development must be a normative concept because it describes desirable ends to which human beings should develop or be led, socially, intellectually, aesthetically and morally.
(Peters, 1972). Thus, notwithstanding ongoing argument about Piagetian *epistemologie* *genétique* and the critiques of modern developmental theorists, “developmentally appropriate practice” looks like a claim for *empirical* validity, but only if its normative and ideological foundation is accepted. This is not to say that those promoting “developmentally appropriate practice” are mistaken, but that in teacher education the normative concept of the development prescribed must be examined. Without that sophisticated values-inquiry, the epistemic purpose of this model in teacher education would start to look more like ideological training rather than engagement with scholarly knowledge (for a reinterpretation of the empirical tradition’s epistemology, see Phillips & Burbules, 2004).

**THE MORAL AGENT-PROFESSIONAL.**

This model is dubbed the moral agent-professional model because its proponents hold that the moral is primary, predominant and pervasive in teaching the young and educating their teachers (see for instance, Peters, 1966; Noddings, 1984; Goodlad *et al.*, 1990; Tom, 1984, 1997; Sackett, 1993; Hansen, 1995, 2001; Fenstermacher & Richardson 2001; Campbell, 2003). It is *primary*, because the educational engagement is a specific endeavor in the development of persons for which teachers are given moral authority. It is *predominant*, because the ends of the engagement are moral, and the means (technique for instance) are subservient to and only justifiable through moral ends with the implication that teachers cannot withdraw from the moral obligations or commitments of the role, as they can eschew certain techniques or bodies of knowledge. It is *pervasive*, because there is no aspect of the engagement to which the moral is irrelevant, not merely in the social day-to-day of the classroom, but in curriculum choice, in subject matter, in the manner of the teacher, the efficacy of teaching methods and the teacher’s practical wisdom, the conduct of schools, and in the individual student perspectives which teachers hope to educate. To have a moral purpose is thus to have an epistemic purpose.

The weaknesses of such a model are diverse. First, it is unlikely that the success of school students will ever be judged in terms of their intellectual and moral virtues, as opposed to SAT scores. Second, public discussions of moral life are frequently entangled with religious beliefs, whether about day-to-day morality or matters of ultimate justification. Third, thereby, assumptions that one can choose any god one likes extend into the moral sphere and its “democracy of values,” i.e. where one person’s choices are as good as another’s, and where teachers are worried about imposing their values. It thereby becomes difficult for the model to establish its credentials in public discussion and in public education. Fourth, such moral discussion of education as exists is often limited to those concerned with moral and character education which, while important, does not yield a comprehensive model for teacher education, and ignores the complex relationship with curriculum content. Fifth, the legacy of the fact-value distinction and, on some views, the impossibility of moral *knowledge* has left scholars in this endeavor unable to penetrate the epistemological issues the moral perspective on education raises. Finally, the historical record of “education for character” (see Hartshorne & May, 1928; Kohlberg, 1981) has left a legacy of contemporary academic ignorance of the model and its possibilities, and some scholars therefore follow Kohlberg’s original thesis, arguing that talk of virtues is just talk of personality, and since it resists empirical verification, can be of little use in educational research (Oser, 1994).

Perspectives on ethics and morality vary. The model would yield very different accounts dependent on the specifics of the ethical position adopted. For example, the
model could be characterized through Dewey’s view of ethics, or perhaps through a religious Thomist account, visible in some parochial schools. The moral agent-professional could also be cast within an ethics of rules, rooted in the classical liberalism of Hobbes, Kant, and Mill, or an ethics of character (or virtue) derived from Aristotle’s account of ἔγνωσμον (Norton, 1991), both of which could also in principle provide an account of the moral agent-professional. All such putative models, (with the probable exception of Mill whose Theory of Logic demand a tough-minded separation of fact and value built on Comte’s account of positivism), will portray a close affinity between the moral position espoused and the epistemic purpose of the educational enterprise.

For the purposes of this chapter, the moral agent-professional model will be derived from Aristotle and his contemporary followers, where the distinction between moral and epistemic purpose evaporates, since they are necessarily integrated in an ethics of virtue (or character), and where the moral end for humankind is ἔγνωσμον. (Norton’s (1991) focus on development, linked strongly to John Dewey’s views of both democracy and growth, requires separate treatment, as does the highly significant emergence of Virtue Epistemology (Fairweather & Zagzebski, 2001; DePaul & Zagzebski, 2003) in the past decade.)

Although ἔγνωσμον is often translated as happiness, Norton holds that it is better understood as a self-actualizing life and self-fulfilling conduct from which a non-hedonic condition and feeling of “happiness” is derived. The moral target, in Norton’s arresting phrase, is “meaningful work to meaningful living.” The ethic is dedicated to the “...enhancement of the quality of life for human beings...” This means the acquisition of moral virtues “where moral virtues are understood as dispositions of character that are (1) personal utilities; (2) intrinsic goods, and (3) social utilities” (Norton, pp. 80–81). This triad reflects, though does not quite instantiate the three general educational purposes of (1) the individual’s development; (2) knowledge as valuable in itself, and (3) those virtues important for social life and citizenship in a democratic society, none which can be salient for the model, since each has moral legitimacy and moral importance. This acquisition takes place as the individual, at his or her own initiative, takes into him or herself values which form an identity comprised of virtues, e.g. the person who comes to value honesty and the absence of deceit thus becoming a truthful person. Education supplies many of the conditions under which such self-direction can be facilitated—and the task of politics in a democratic society, on Norton’s view, is to remove obstacles (like poverty or injustice) which prevent that fulfillment.

Teacher Education would therefore be centered on the process of self-discovery as a teacher through the development of those virtues germane to the task of teaching, congruent with personal virtues. This is developing an identity primarily out of personal values and commitments, not out of adherence to professional norms. The teacher educator’s role in facilitating this self-discovery by students through practices involving learning disciplines, classroom experience, community service, or the arts and crafts of democratic citizenship, will necessitate an encounter with values inherent, often through tradition (Hansen, 2001) in these practices including those intellectual and moral virtues necessary for learning a discipline. Moral identity is therefore built out of commitment to the values which the individual encounters and which become dispositions of character and thereby virtues. However, such virtues are not merely the property of the individual but of the institutions. To describe an institution is to describe its values: both schools and schools of education would, on this model, perceive these values as characteristics of their ethos, and regard them as primary, predominant and pervasive (see MacIntyre, 1984; Zagzebski, 1996).

Typical “individual” virtues include sincerity, care, integrity, honesty, empathy,
imaginativeness, and courage (moral and intellectual) and such virtues of the will as persistence, perseverance and courage (Sockett, 1988). Typical “social” virtues include commitments to justice, temperance, tact, discretion, civility, tolerance and liberality. Typical “knowledge” virtues (what Phillips and Burbules (2000) call “cognitive values”) are accuracy, clarity, open-mindedness, humility, and fair-mindedness. Manifestly there is overlap and integration between these categories and the dispositions typical of each. For the moral agent-professional model, however, the school curriculum and the teacher education curriculum would be conceptualized as much through the development of these virtues as through the acquisition of knowledge items, for these qualities range over intellectual, social, personal life, and life in the workplace. They are part of who one is.

Bernard Williams (2002) in *Truth and Truthfulness* provides an argument which can be used to understand how the moral agent-professional model might integrate moral and epistemic purpose in teacher education, as he specifically explores two virtues both of which are significant for truth (and thereby for knowledge)—accuracy and sincerity. Both provide examples of (a) how the moral and the epistemic purposes are integrated, and (b) how the model could construe the connections implied in this moral-epistemic reciprocity, for example, how the epistemic notion of belief is connected to open-mindedness and tolerance, or differently to intellectual courage.

Following Williams, we can connect the moral and epistemic in this way. Truth is a property of statements whereas truthfulness is a property of persons. In educating teachers, the model would claim, it is desirable that they come to believe what is true, and make true statements, assertions and claims about what they believe. So we connect these epistemic characteristics to the claim that, morally, teachers should be or become truthful people especially, we might say, in being truthful to themselves and not becoming victims of self-deceit, a condition Shulman detects in the contemporary undergraduate (Shulman, 1999). Truthfulness is seen as a desirable disposition, i.e. a stable characteristic of the ways a person acts (see the NCATE emphasis on teacher dispositions, and Scockett, 2006 (ed.)). Stability implies consistency, so teachers cannot be people who tell the truth only when it suits them, so they must come to be truthful people and truthful teachers. Yet truthfulness, on Williams’ (2002) account, is a virtue or disposition of character with two constituent “basic virtues of truth”—accuracy and sincerity. Accuracy connects to acquiring a correct belief, and sincerity to the motivation to say what one actually believes, both of which are critical to the establishment of a relationship of trust, morally crucial in classrooms and schools. These intimate connections between truth, accuracy, sincerity and trust are thus at once moral and epistemic and they serve as illustrations of how, in the moral agent-professional model, the character of research and scholarly knowledge will be somewhat different from other models.

For the purposes of illustrating the link between the moral and the epistemic in this model, the focus here will be only on accuracy. Dispositions of character are seen as virtues because they counter human failings and foibles which, in this case of accuracy, are the “motivations to conceal or dissimulate” (Williams, 2002, p. 124). Accuracy “lies in the skills and attitudes that resist the pleasure principle, in all its forms, from a gross need to believe the agreeable, to mere laziness in checking one’s investigations” (Williams, p. 125). The core attitude needed is a concern for truth, indeed a passion for getting it right” (p. 127) such that it can be a matter of honor, or conscience, or self-respect to do just that. The specific skills needed will vary from context to context in the public world, and in the school from discipline to discipline. Accuracy thus implies “care, reliability and so on in discovering and coming to believe the truth” (p. 127), recognizing the differences within disciplines but the coherence of it as an intellectual and moral virtue. On the moral epistemic connection, it is as important to teach children to be
accurate as it is to teach them mathematics: yet of course, the one cannot be done without the other.

This brief account of accuracy illustrates the moral-epistemic relationship as conceived by the model. For teachers, it is not simply prudent to have children get the sums right, or to have the facts clear, but to have them come to value accuracy as important (when sloppiness, laziness, tiredness, and the attractions of the TV seem overwhelming) and to identify with that specific value a disposition of their character. In psychological terms, the target is not just intrinsic motivation, but motivation directed to who one is. So the model would expect from teachers a double duty: to be accurate themselves, both for their own character and as an example, and to teach children this specific, but not exclusive, virtue of truth. For accuracy, on this account, could not be regarded as some kind of virtuous skill to be taught outside a context: it would be seen as being developed in terms of the intellectual content which poses intellectual challenges, e.g. the academic disciplines (Sockett, 2000). Unsurprisingly, the moral agent-professional model characterizes the teacher as continuously facing complex moral problems, specifically but not exclusively in the moral content of what is being taught (e.g. Is what I am teaching true? Am I being truthful? Does my playing devil’s advocate here undermine my sincerity? Should I have let these inaccuracies slip by? Am I trustworthy?) but in the moral responsibilities the teacher has to the school as an institution and its ethos.

Manifestly this model is not on the horizons of most contemporary thought about teacher education, except in so far as NCATE is urging institutions to define those dispositions it wishes to foster in novice teachers (see Sockett (ed.), 2006). Proponents of the model, derived from Aristotle, would urge a radical re-thinking of teacher education, rooted in an institutional ethos, intellectual rigor and the articulation and discussion of the profound character of moral issues confronting the teacher, specifically in terms of how they begin to articulate their moral identity, which can only be achieved on their own initiative. Yet a model derived from Dewey, with a very different set of moral and epistemic assumptions, would urge a similar radical re-thinking.

CONCLUSION

These four models provide one incomplete panorama of the conceptualization of moral and epistemic purposes in teacher education. If the implicit aim of the movement for teaching as a profession is consensus, it is extremely difficult to see how the differing moral and epistemic perspectives can easily be reconciled. The difficulty of some form of reconciliation and common base is fourfold: first, educational research is divided by paradigms of method and approach and it is in no one’s self-interest in the academy to search for reconciliation. Second, the bureaucracy of public education is conducted in a discourse to which the clinician-professional model is the closest, but even that does not come near the language of the free market. Third, the thrust towards professionalization is connected with the academic’s identification of professionalism than the teacher’s, with the absence of partnership that suggests. Finally, teacher education thus requires more significant philosophical inquiry at institutional, curriculum and pedagogical levels if the complexities of moral and epistemic purposes are to be fully articulated. That would probably mean abandoning the attempt at consensus around the medical model of professionalism and the development of alternative models, each of which might gain public acceptance.

1.1 The American scholar

*Ralph Waldo Emerson*

Mr. President and Gentlemen,

I greet you on the re-commencement of our literary year. Our anniversary is one of hope, and, perhaps, not enough of labor. We do not meet for games of strength or skill, for the recitation of histories, tragedies, and odes, like the ancient Greeks; for parliaments of love and poesy, like the Troubadours; nor for the advancement of science, like our contemporaries in the British and European capitals. Thus far, our holiday has been simply a friendly sign of the survival of the love of letters amongst a people too busy to give to letters any more. As such, it is precious as the sign of an indestructible instinct. Perhaps the time is already come, when it ought to be, and will be, something else: when the sluggard intellect of this continent will look from under its iron lids, and fill the postponed expectation of the world with something better than the exertions of mechanical skill. Our day of dependence, our long apprenticeship to the learning of other lands, draws to a close. The millions, that around us are rushing into life, cannot always be fed on the sere remains of foreign harvests. Events, actions arise, that must be sung, that will sing themselves. Who can doubt, that poetry will revive and lead in a new age, as the star in the constellation Harp, which now flames in our zenith, astronomers announce, shall one day be the pole-star for a thousand years?

In this hope, I accept the topic which not only usage, but the nature of our association, seem to prescribe to this day,—the AMERICAN SCHOLAR. Year by year, we come up hither to read one more chapter of his biography. Let us inquire what light new days and events have thrown on his character, and his hopes.

It is one of those fables, which, out of an unknown antiquity, convey an unlooked-for wisdom, that the gods, in the beginning, divided Man into men, that he might be more helpful to himself; just as the hand was divided into fingers, the better to answer its end.

The old fable covers a doctrine ever new and sublime; that there is One Man,—present to all particular men only partially, or through one faculty; and that you must take the whole society to find the whole man. Man is not a farmer, or a professor, or an engineer, but he is all. Man is priest, and scholar, and statesman, and producer, and soldier. In the divided or social state, these functions are parcelled out to individuals, each of whom aims to do his stint of the joint work, whilst each other performs his. The fable implies, that the individual, to possess himself, must sometimes return from his own labor to embrace all the other laborers. But unfortunately, this original unit, this fountain of power, has been so distributed to multitudes, has been so minutely subdivided and peddled out, that it is spilled into drops, and cannot be gathered. The state of society is one in which the members have suffered amputation from the trunk, and strut about so many walking monsters,—a good finger, a neck, a stomach, an elbow, but never a man.

Man is thus metamorphosed into a thing, into many things. The planter, who is Man sent out into the field to gather food, is seldom cheered by any idea of the true dignity of his ministry. He sees his bushel and his cart, and nothing beyond, and sinks into the farmer, instead of Man on the farm. The tradesman scarcely ever gives an ideal worth to his work, but is ridden by the routine of his craft, and the soul is subject to dollars. The priest becomes a form; the attorney, a statute-book; the mechanic, a machine; the sailor, a rope of a ship.
In this distribution of functions, the scholar is the delegated intellect. In the right state, he is, Man Thinking. In the degenerate state, when the victim of society, he tends to become a mere thinker, or, still worse, the parrot of other men’s thinking.

In this view of him, as Man Thinking, the theory of his office is contained. Him nature solicits with all her placid, all her monitory pictures; him the past instructs; him the future invites. Is not, indeed, every man a student, and do not all things exist for the student’s behoof? And, finally, is not the true scholar the only true master? But the old oracle said, “All things have two handles: beware of the wrong one.” In life, too often, the scholar errs with mankind and forfeits his privilege. Let us see him in his school, and consider him in reference to the main influences he receives.

I The first in time and the first in importance of the influences upon the mind is that of nature. Every day, the sun; and, after sunset, night and her stars. Ever the winds blow; ever the grass grows. Every day, men and women, conversing, beholding and beholden. The scholar is he of all men whom this spectacle most engages. He must settle its value in his mind. What is nature to him? There is never a beginning, there is never an end, to the inexplicable continuity of this web of God, but always circular power returning into itself. Therein it resembles his own spirit, whose beginning, whose ending, he never can find,—so entire, so boundless. Far, too, as her splendors shine, system on system shooting like rays, upward, downward, without centre, without circumference,—in the mass and in the particle, nature hastens to render account of herself to the mind. Classification begins. To the young mind, every thing is individual, stands by itself. By and by, it finds how to join two things, and see in them one nature; then three, then three thousand; and so, tyrannized over by its own unifying instinct, it goes on tying things together, diminishing anomalies, discovering roots running under ground, whereby contrary and remote things cohere, and flower out from one stem. It presently learns, that, since the dawn of history, there has been a constant accumulation and classifying of facts. But what is classification but the perceiving that these objects are not chaotic, and are not foreign, but have a law which is also a law of the human mind? The astronomer discovers that geometry, a pure abstraction of the human mind, is the measure of planetary motion. The chemist finds proportions and intelligible method throughout matter; and science is nothing but the finding of analogy, identity, in the most remote parts. The ambitious soul sits down before each refractory fact; one after another, reduces all strange constitutions, all new powers, to their class and their law, and goes on for ever to animate the last fibre of organization, the outskirts of nature, by insight.

Thus to him, to this school-boy under the bending dome of day, is suggested, that he and it proceed from one root; one is leaf and one is flower; relation, sympathy, stirring in every vein. And what is that Root? Is not that the soul of his soul?—A thought too bold,—a dream too wild. Yet when this spiritual light shall have revealed the law of more earthly natures,—when he has learned to worship the soul, and to see that the natural philosophy that now is, is only the first gropings of its gigantic hand, he shall look forward to an ever expanding knowledge as to a becoming creator. He shall see, that nature is the opposite of the soul, answering to it part for part. One is seal, and one is print. Its beauty is the beauty of his own mind. Its laws are the laws of his own mind. Nature then becomes to him the measure of his attainments. So much of nature as he is ignorant of, so much of his own mind does he not yet possess. And, in fine, the ancient precept, “Know thyself,” and the modern precept, “Study nature,” become at last one maxim.

II The next great influence into the spirit of the scholar, is, the mind of the Past,—in whatever form, whether of literature, of art, of institutions, that mind is inscribed. Books are the best type of the influence of the past, and perhaps we shall get at the truth,—learn the amount of this influence more conveniently,—by considering their value alone.

The theory of books is noble. The scholar of the first age received into him the world around; brooded thereon; gave it the new arrangement of his own mind, and uttered it again. It came into
him, life; it went out from him, truth. It came to him, short-lived actions; it went out from him, immortal thoughts. It came to him, business; it went from him, poetry. It was dead fact; now, it is quick thought. It can stand, and it can go. It now endures, it now flies, it now inspires. Precisely in proportion to the depth of mind from which it issued, so high does it soar, so long does it sing.

Or, I might say, it depends on how far the process had gone, of transmuting life into truth. In proportion to the completeness of the distillation, so will the purity and imperishableness of the product be. But none is quite perfect. As no air-pump can by any means make a perfect vacuum, so neither can any artist entirely exclude the conventional, the local, the perishable from his book, or write a book of pure thought, that shall be as efficient, in all respects, to a remote posterity, as to contemporaries, or rather to the second age. Each age, it is found, must write its own books; or rather, each generation for the next succeeding. The books of an older period will not fit this.

Yet hence arises a grave mischief. The sacredness which attaches to the act of creation,—the act of thought,—is transferred to the record. The poet chanting, was felt to be a divine man: henceforth the chant is divine also. The writer was a just and wise spirit: henceforward it is settled, the book is perfect; as love of the hero corrupts into worship of his statue. Instantly, the book becomes noxious: the guide is a tyrant. The sluggish and perverted mind of the multitude, slow to open to the incursions of Reason, having once so opened, having once received this book, stands upon it, and makes an outcry, if it is disparaged. Colleges are built on it. Books are written on it by thinkers, not by Man Thinking; by men of talent, that is, who start wrong, who set out from accepted dogmas, not from their own sight of principles. Meek young men grow up in libraries, believing it their duty to accept the views, which Cicero, which Locke, which Bacon, have given, forgetful that Cicero, Locke, and Bacon were only young men in libraries, when they wrote these books.

Hence, instead of Man Thinking, we have the bookworm. Hence, the book-learned class, who value books, as such; not as related to nature and the human constitution, but as making a sort of Third Estate with the world and the soul. Hence, the restorers of readings, the emendators, the bibliomaniacs of all degrees.

Books are the best of things, well used; abused, among the worst. What is the right use? What is the one end, which all means go to effect? They are for nothing but to inspire. I had better never see a book, than to be warped by its attraction clean out of my own orbit, and made a satellite instead of a system. The one thing in the world, of value, is the active soul. This every man is entitled to; this every man contains within him, although, in almost all men, obstructed, and as yet unborn. The soul active sees absolute truth; and utters truth, or creates. In this action, it is genius; not the privilege of here and there a favorite, but the sound estate of every man. In its essence, it is progressive. The book, the college, the school of art, the institution of any kind, stop with some past utterance of genius. This is good, say they,—let us hold by this. They pin me down. They look backward and not forward. But genius looks forward: the eyes of man are set in his forehead, not in his hindhead: man hopes: genius creates. Whatever talents may be, if the man create not, the pure efflux of the Deity is not his;—cinders and smoke there may be, but not yet flame. There are creative manners, there are creative actions, and creative words; manners, actions, words, that is, indicative of no custom or authority, but springing spontaneous from the mind’s own sense of good and fair.

On the other part, instead of being its own seer, let it receive from another mind its truth, though it were in torrents of light, without periods of solitude, inquest, and self-recovery, and a fatal disservice is done. Genius is always sufficiently the enemy of genius by over influence. The literature of every nation bear me witness. The English dramatic poets have Shakspearized now for two hundred years.

Undoubtedly there is a right way of reading, so it be sternly subordinated. Man Thinking must not be subdued by his instruments. Books are for the scholar’s idle times. When he can read God directly, the hour is too precious to be wasted in other men’s transcripts of their readings. But when the intervals of darkness come, as come they must,—when the sun is hid, and the stars withdraw
their shining,—we repair to the lamps which were kindled by their ray, to guide our steps to the East again, where the dawn is. We hear, that we may speak. The Arabian proverb says, “A fig tree, looking on a fig tree, becometh fruitful.”

It is remarkable, the character of the pleasure we derive from the best books. They impress us with the conviction, that one nature wrote and the same reads. We read the verses of one of the great English poets, of Chaucer, of Marvell, of Dryden, with the most modern joy,—with a pleasure, I mean, which is in great part caused by the abstraction of all time from their verses. There is some awe mixed with the joy of our surprise, when this poet, who lived in some past world, two or three hundred years ago, says that which lies close to my own soul, that which I also had wellnigh thought and said. But for the evidence thence afforded to the philosophical doctrine of the identity of all minds, we should suppose some preestablished harmony, some foresight of souls that were to be, and some preparation of stores for their future wants, like the fact observed in insects, who lay up food before death for the young grub they shall never see.

I would not be hurried by any love of system, by any exaggeration of instincts, to underrate the Book. We all know, that, as the human body can be nourished on any food, though it were boiled grass and the broth of shoes, so the human mind can be fed by any knowledge. And great and heroic men have existed, who had almost no other information than by the printed page. I only would say, that it needs a strong head to bear that diet. One must be an inventor to read well. As the proverb says, “He that would bring home the wealth of the Indies, must carry out the wealth of the Indies.” There is then creative reading as well as creative writing. When the mind is braced by labor and invention, the page of whatever book we read becomes luminous with manifold allusion. Every sentence is doubly significant, and the sense of our author is as broad as the world.

We then see, what is always true, that, as the seer’s hour of vision is short and rare among heavy days and months, so is its record, perchance, the least part of his volume. The discerning will read, in his Plato or Shakespeare, only that least part,—only the authentic utterances of the oracle;—all the rest he rejects, were it never so many times Plato’s and Shakespeare’s.

Of course, there is a portion of reading quite indispensable to a wise man. History and exact science he must learn by laborious reading. Colleges, in like manner, have their indispensable office,—to teach elements. But they can only highly serve us, when they aim not to drill, but to create; when they gather from far every ray of various genius to their hospitable halls, and, by the concentrated fires, set the hearts of their youth on flame. Thought and knowledge are natures in which apparatus and pretension avail nothing. Gowns, and pecuniary foundations, though of towns of gold, can never countervail the least sentence or syllable of wit. Forget this, and our American colleges will recede in their public importance, whilst they grow richer every year.

III There goes in the world a notion, that the scholar should be a recluse, a valetudinarian,—as unfit for any handiwork or public labor, as a penknife for an axe. The so-called “practical men” sneer at speculative men, as if, because they speculate or see, they could do nothing. I have heard it said that the clergy,—who are always, more universally than any other class, the scholars of their day,—are addressed as women; that the rough, spontaneous conversation of men they do not hear, but only a mincing and diluted speech. They are often virtually disfranchised; and, indeed, there are advocates for their celibacy. As far as this is true of the studious classes, it is not just and wise. Action is with the scholar subordinate, but it is essential. Without it, he is not yet man. Without it, thought can never ripen into truth. Whilst the world hangs before the eye as a cloud of beauty, we cannot even see its beauty. Inaction is cowardice, but there can be no scholar without the heroic mind. The preamble of thought, the transition through which it passes from the unconscious to the conscious, is action. Only so much do I know, as I have lived. Instantly we know whose words are loaded with life, and whose not.

The world,—this shadow of the soul, or other me, lies wide around. Its attractions are the keys which unlock my thoughts and make me acquainted with myself. I run eagerly into this resounding
tumult. I grasp the hands of those next to me, and take my place in the ring to suffer and to work, taught by an instinct, that so shall the dumb abyss be vocal with speech. I pierce its order; I disperse its fear; I dispose of it within the circuit of my expanding life. So much only of life as I know by experience, so much of the wilderness have I vanquished and planted, or so far have I extended my being, my dominion. I do not see how any man can afford, for the sake of his nerves and his nap, to spare any action in which he can partake. It is pearls and rubies to his discourse. Drudgery, calamity, exasperation, want, are instructors in eloquence and wisdom. The true scholar grudges every opportunity of action past by, as a loss of power.

It is the raw material out of which the intellect moulds her splendid products. A strange process too, this, by which experience is converted into thought, as a mulberry leaf is converted into satin. The manufacture goes forward at all hours.

The actions and events of our childhood and youth, are now matters of calmest observation. They lie like fair pictures in the air. Not so with our recent actions,—with the business which we now have in hand. On this we are quite unable to speculate. Our affections as yet circulate through it. We no more feel or know it, than we feel the feet, or the hand, or the brain of our body. The new deed is yet a part of life,—remains for a time immersed in our unconscious life. In some contemplative hour, it detaches itself from the life like a ripe fruit, to become a thought of the mind. Instantly, it is raised, transfigured; the corruptible has put on incorruption. Henceforth it is an object of beauty, however base its origin and neighborhood. Observe, too, the impossibility of antedating this act. In its grub state, it cannot fly, it cannot shine, it is a dull grub. But suddenly, without observation, the selfsame thing unfurls beautiful wings, and is an angel of wisdom. So is there no fact, no event, in our private history, which shall not, sooner or later, lose its adhesive, inert form, and astonish us by soaring from our body into the empyrean. Cradle and infancy, school and playground, the fear of boys, and dogs, and ferules, the love of little maids and berries, and many another fact that once filled the whole sky, are gone already; friend and relative, profession and party, town and country, nation and world, must also soar and sing.

Of course, he who has put forth his total strength in fit actions, has the richest return of wisdom. I will not shut myself out of this globe of action, and transplant an oak into a flower-pot, there to hunger and pine; nor trust the revenue of some single faculty, and exhaust one vein of thought, much like those Savoyards, who, getting their livelihood by carving shepherds, shepherdesses, and smoking Dutchmen, for all Europe, went out one day to the mountain to find stock, and discovered that they had whittled up the last of their pine-trees. Authors we have, in numbers, who have written out their vein, and who, moved by a commendable prudence, sail for Greece or Palestine, follow the trapper into the prairie, or ramble round Algiers, to replenish their merchantable stock.

If it were only for a vocabulary, the scholar would be covetous of action. Life is our dictionary. Years are well spent in country labors; in town,—in the insight into trades and manufactures; in frank intercourse with many men and women; in science; in art; to the one end of mastering in all their facts a language by which to illustrate and embody our perceptions. I learn immediately from any speaker how much he has already lived, through the poverty or the splendor of his speech. Life lies behind us as the quarry from whence we get tiles and copingstones for the masonry of to-day. This is the way to learn grammar. Colleges and books only copy the language which the field and the work-yard made.

But the final value of action, like that of books, and better than books, is, that it is a resource. That great principle of Undulation in nature, that shows itself in the inspiring and expiring of the breath; in desire and satiety; in the ebb and flow of the sea; in day and night; in heat and cold; and as yet more deeply ingrained in every atom and every fluid, is known to us under the name of Polarity,—these “fits of easy transmission and reflection,” as Newton called them, are the law of nature because they are the law of spirit.

The mind now thinks; now acts; and each fit reproduces the other. When the artist has
exhausted his materials, when the fancy no longer paints, when thoughts are no longer apprehended, and books are a weariness,—he has always the resource to live. Character is higher than intellect. Thinking is the function. Living is the functionary. The stream retreats to its source. A great soul will be strong to live, as well as strong to think. Does he lack organ or medium to impart his truths? He can still fall back on this elemental force of living them. This is a total act. Thinking is a partial act. Let the grandeur of justice shine in his affairs. Let the beauty of affection cheer his lowly roof. Those “far from fame,” who dwell and act with him, will feel the force of his constitution in the doings and passages of the day better than it can be measured by any public and designed display. Time shall teach him, that the scholar loses no hour which the man lives. Herein he unfolds the sacred germ of his instinct, screened from influence. What is lost in sembliness is gained in strength. Not out of those, on whom systems of education have exhausted their culture, comes the helpful giant to destroy the old or to build the new, but out of unhandselled savage nature, out of terrible Druids and Berserkirs, come at last Alfred and Shakespeare.

I hear therefore with joy whatever is beginning to be said of the dignity and necessity of labor to every citizen. There is virtue yet in the hoe and the spade, for learned as well as for unlearned hands. And labor is everywhere welcome; always we are invited to work; only be this limitation observed, that a man shall not for the sake of wider activity sacrifice any opinion to the popular judgments and modes of action.

I have now spoken of the education of the scholar by nature, by books, and by action. It remains to say somewhat of his duties. They are such as become Man Thinking. They may all be comprised in self-trust. The office of the scholar is to cheer, to raise, and to guide men by showing them facts amidst appearances. He plies the slow, unhonored, and unpaid task of observation. Flamsteed and Herschel, in their glazed observatories, may catalogue the stars with the praise of all men, and, the results being splendid and useful, honor is sure. But he, in his private observatory, cataloguing obscure and nebulous stars of the human mind, which as yet no man has thought of as such,—watching days and months, sometimes, for a few facts; correcting still his old records;—must relinquish display and immediate fame. In the long period of his preparation, he must betray often an ignorance and shiftlessness in popular arts, incurring the disdain of the able who shoulder him aside. Long he must stammer in his speech; often forego the living for the dead. Worse yet, he must accept,—how often! poverty and solitude. For the ease and pleasure of treading the old road, accepting the fashions, the education, the religion of society, he takes the cross of making his own, and, of course, the self-accusation, the faint heart, the frequent uncertainty and loss of time, which are the nettles and tangling vines in the way of the self-relying and self-directed; and the state of virtual hostility in which he seems to stand to society, and especially to educated society. For all this loss and scorn, what offset? He is to find consolation in exercising the highest functions of human nature. He is one, who raises himself from private considerations, and breathes and lives on public and illustrious thoughts. He is the world’s eye. He is the world’s heart. He is to resist the vulgar prosperity that retrogrades ever to barbarism, by preserving and communicating heroic sentiments, noble biographies, melodious verse, and the conclusions of history. Whatsoever oracles the human heart, in all emergencies, in all solemn hours, has uttered as its commentary on the world of actions,—these he shall receive and impart. And whatsoever new verdict Reason from her inviolable seat pronounces on the passing men and events of to-day,—this he shall hear and promulgate.

These being his functions, it becomes him to feel all confidence in himself, and to defer never to the popular cry. He and he only knows the world. The world of any moment is the merest appearance. Some great decorum, some fetish of a government, some ephemeral trade, or war, or man, is cried up by half mankind and cried down by the other half, as if all depended on this particular up or down. The odds are that the whole question is not worth the poorest thought which the scholar has lost in listening to the controversy. Let him not quit his belief that a popgun
is a popgun, though the ancient and honorable of the earth affirm it to be the crack of doom. In silence, in steadiness, in severe abstraction, let him hold by himself; add observation to observation, patient of neglect, patient of reproach; and bide his own time,—happy enough, if he can satisfy himself alone, that this day he has seen something truly. Success treads on every right step. For the instinct is sure, that prompts him to tell his brother what he thinks. He then learns, that in going down into the secrets of his own mind, he has descended into the secrets of all minds. He learns that he who has mastered any law in his private thoughts, is master to that extent of all men whose language he speaks, and of all into whose language his own can be translated. The poet, in utter solitude remembering his spontaneous thoughts and recording them, is found to have recorded that, which men in crowded cities find true for them also. The orator distrusts at first the fitness of his frank confessions,—his want of knowledge of the persons he addresses,—until he finds that he is the complement of his hearers;—that they drink his words because he fulfill for them their own nature; the deeper he dives into his privatest, secretest presentiment, to his wonder he finds, this is the most acceptable, most public, and universally true. The people delight in it; the better part of every man feels, This is my music; this is myself.

In self-trust, all the virtues are comprehended. Free should the scholar be,—free and brave. Free even to the definition of freedom, "without any hindrance that does not arise out of his own constitution." Brave; for fear is a thing, which a scholar by his very function puts behind him. Fear always springs from ignorance. It is a shame to him if his tranquility, amid dangerous times, arise from the presumption, that, like children and women, his is a protected class; or if he seek a temporary peace by the diversion of his thoughts from politics or vexed questions, hiding his head like an ostrich in the flowering bushes, peeping into microscopes, and turning rhymes, as a boy whistles to keep his courage up. So is the danger a danger still; so is the fear worse. Manlike let him turn and face it. Let him look into its eye and search its nature, inspect its origin,—see the whelping of this lion,—which lies no great way back; he will then find in himself a perfect comprehension of its nature and extent; he will have made his hands meet on the other side, and can henceforth defy it, and pass on superior. The world is his, who can see through its pretension. What deafness, what stone-blind custom, what overgrown error you behold, is there only by sufferance,—by your sufferance. See it to be a lie, and you have already dealt it its mortal blow.

Yes, we are the cowed,—we the trustless. It is a mischievous notion that we are come late into nature; that the world was finished a long time ago. As the world was plastic and fluid in the hands of God, so it is ever to so much of his attributes as we bring to it. To ignorance and sin, it is flint. They adapt themselves to it as they may; but in proportion as a man has any thing in him divine, the firmament flows before him and takes his signet and form. Not he is great who can alter matter, but he who can alter my state of mind. They are the kings of the world who give the color of their present thought to all nature and all art, and persuade men by the cheerful serenity of their carrying the matter, that this thing which they do, is the apple which the ages have desired to pluck, now at last ripe, and inviting nations to the harvest. The great man makes the great thing. Wherever Macdonald sits, there is the head of the table. Linnaeus makes botany the most alluring of studies, and wins it from the farmer and the herb-woman; Davy, chemistry; and Cuvier, fossils. The day is always his, who works in it with serenity and great aims. The unstable estimates of men crowd to him whose mind is filled with a truth, as the heaped waves of the Atlantic follow the moon.

For this self-trust, the reason is deeper than can be fathomed,—darker than can be enlightened. I might not carry with me the feeling of my audience in stating my own belief. But I have already shown the ground of my hope, in adverting to the doctrine that man is one. I believe man has been wronged; he has wronged himself. He has almost lost the light, that can lead him back to his prerogatives. Men are become of no account. Men in history, men in the world of to-day are bugs, are spawn, and are called "the mass" and "the herd." In a century, in a millennium, one or two men; that is to say,—one or two approximations to the right state of every man. All the rest behold
in the hero or the poet their own green and crude being,—ripened; yes, and are content to be less, so that may attain to its full stature. What a testimony,—full of grandeur, full of pity, is borne to the demands of his own nature, by the poor clansman, the poor partisan, who rejoices in the glory of his chief. The poor and the low find some amends to their immense moral capacity, for their acquiescence in a political and social inferiority. They are content to be brushed like flies from the path of a great person, so that justice shall be done by him to that common nature which it is the dearest desire of all to see enlarged and glorified. They sun themselves in the great man's light, and feel it to be their own element. They cast the dignity of man from their downtrodden selves upon the shoulders of a hero, and will perish to add one drop of blood to make that great heart beat, those giant sinews combat and conquer. He lives for us, and we live in him.

Men such as they are, very naturally seek money or power; and power because it is as good as money,—the "spoils," so called, "of office." And why not? for they aspire to the highest, and this, in their sleep-walking, they dream is highest. Wake them, and they shall quit the false good, and leap to the true, and leave governments to clerks and desks. This revolution is to be wrought by the gradual domestication of the idea of Culture. The main enterprise of the world for splendor, for extent, is the building of a man. Here are the materials strown along the ground. The private life of one man shall be a more illustrious monarchy,—more formidable to its enemy, more sweet and serene in its influence to its friend, than any kingdom in history. For a man, rightly viewed, comprehendeth the particular natures of all men. Each philosopher, each bard, each actor, has only done for me, as by a delegate, what one day I can do for myself. The books which once we valued more than the apple of the eye, we have quite exhausted. What is that but saying, that we have come up with the point of view which the universal mind took through the eyes of one scribe; we have been that man, and have passed on. First, one; then, another; we drain all cisterns, and, waxing greater by all these supplies, we drain all cisterns, and, waxing greater by all these supplies, we see with our feet; the time is infected with Hamlet's unhappiness,—"Sicklied o'er with the pale cast of thought." Is it so bad then? Sight is the last thing to be pitied. Would we be blind? Do we fear lest we should outsee nature and God, and drink truth dry? I look upon the discontent of the literary class, as a mere announcement of the fact, that they find themselves not in the state of mind of their fathers, and regret the coming state as untried; as a boy dreads the water before he has learned that he can swim. If there is any period one would desire to be born in,—is it not the age of Revolution; when the old and the new stand side by side, and admit of being compared; when the energies of all men are searched by fear and by hope; when the historic glories of the old, can be compensated by the rich possibilities of the new era? This time, like all times, is a very good one, if we but know what to do with it.
I read with joy some of the auspicious signs of the coming days, as they glimmer already through poetry and art, through philosophy and science, through church and state.

One of these signs is the fact, that the same movement which effected the elevation of what was called the lowest class in the state, assumed in literature a very marked and as benign an aspect. Instead of the sublime and beautiful; the near, the low, the common, was explored and poetized. That, which had been negligently trodden under foot by those who were harnessing and provisioning themselves for long journeys into far countries, is suddenly found to be richer than all foreign parts. The literature of the poor, the feelings of the child, the philosophy of the street, the meaning of household life, are the topics of the time. It is a great stride. It is a sign,—is it not? of new vigor, when the extremities are made active, when currents of warm life run into the hands and the feet. I ask not for the great, the remote, the romantic; what is doing in Italy or Arabia; what is Greek art, or Provencal minstrelsy; I embrace the common, I explore and sit at the feet of the familiar, the low. Give me insight into to-day, and you may have the antique and future worlds. What would we really know the meaning of? The meal in the firkin; the milk in the pan; the ballad in the street; the news of the boat; the glance of the eye; the form and the gait of the body;—show me the ultimate reason of these matters; show me the sublime presence of the highest spiritual cause lurking, as always it does lurk, in these suburbs and extremities of nature; let me see every trifle bristling with the polarity that ranges it instantly on an eternal law; and the shop, the plough, and the ledger, referred to the like cause by which light undulates and poets sing;—and the world lies no longer a dull miscellany and lumber-room, but has form and order; there is no trifle; there is no puzzle; but one design unites and animates the farthest pinnacle and the lowest trench.

This idea has inspired the genius of Goldsmith, Burns, Cowper, and, in a newer time, of Goethe, Wordsworth, and Carlyle. This idea they have differently followed and with various success. In contrast with their writing, the style of Pope, of Johnson, of Gibbon, looks cold and pedantic. This writing is blood-warm. Man is surprised to find that things near are not less beautiful and wondrous than things remote. The near explains the far. The drop is a small ocean. A man is related to all nature. This perception of the worth of the vulgar is fruitful in discoveries. Goethe, in this very thing the most modern of the moderns, has shown us, as none ever did, the genius of the ancients.

There is one man of genius, who has done much for this philosophy of life, whose literary value has never yet been rightly estimated;—I mean Emanuel Swedenborg. The most imaginative of men, yet writing with the precision of a mathematician, he endeavored to engrat a purely philosophical Ethics on the popular Christianity of his time. Such an attempt, of course, must have difficulty, which no genius could surmount. But he saw and showed the connection between nature and the affections of the soul. He pierced the emblematic or spiritual character of the visible, audible, tangible world. Especially did his shade-loving muse hover over and interpret the lower parts of nature; he showed the mysterious bond that allies moral evil to the foul material forms, and has given in epical parables a theory of insanity, of beasts, of unclean and fearful things.

Another sign of our times, also marked by an analogous political movement, is, the new importance given to the single person. Every thing that tends to insulate the individual,—to surround him with barriers of natural respect, so that each man shall feel the world is his, and man shall treat with man as a sovereign state with a sovereign state,—tends to true union as well as greatness. “I learned,” said the melancholy Pestalozzi, “that no man in God’s wide earth is either willing or able to help any other man.” Help must come from the bosom alone. The scholar is that man who must take up into himself all the ability of the time, all the contributions of the past, all the hopes of the future. He must be an university of knowledges. If there be one lesson more than another, which should pierce his ear, it is. The world is nothing, the man is all; in yourself is the law of all nature, and you know not yet how a globule of sap ascends; in yourself slumbers the whole of Reason; it is for you to know all, it is for you to dare all.

Mr. President and Gentlemen, this confidence in the unsearched might of man belongs, by all
motives, by all prophecy, by all preparation, to the American Scholar. We have listened too long
to the courtly muses of Europe. The spirit of the American freeman is already suspected to be
timid, imitative, tame. Public and private avarice make the air we breathe thick and fat. The
scholar is decent, indolent, complaisant. See already the tragic consequence. The mind of this
country, taught to aim at low objects, eats upon itself. There is no work for any but the decorous
and the complaisant. Young men of the fairest promise, who begin life upon our shores, inflated
by the mountain winds, shined upon by all the stars of God, find the earth below not in unison with
these,—but are hindered from action by the disgust which the principles on which business is
managed inspire, and turn drudges, or die of disgust,—some of them suicides. What is the
remedy? They did not yet see, and thousands of young men as hopeful now crowding to the
barriers for the career do not yet see, that, if the single man plant himself indomitably on his
instincts, and there abide, the huge world will come round to him. Patience,—patience;—with
the shades of all the good and great for company; and for solace, the perspective of your own
infinite life; and for work, the study and the communication of principles, the making those
instincts prevalent, the conversion of the world. Is it not the chief disgrace in the world, not to be
an unit;—not to be reckoned one character;—not to yield that peculiar fruit which each man was
created to bear, but to be reckoned in the gross, in the hundred, or the thousand, of the party, the
section, to which we belong; and our opinion predicted geographically, as the north, or the south?
Not so, brothers and friends,—please God, ours shall not be so. We will walk on our own feet; we
will work with our own hands; we will speak our own minds. The study of letters shall be no longer
a name for pity, for doubt, and for sensual indulgence. The dread of man and the love of man shall
be a wall of defence and a wreath of joy around all. A nation of men will for the first time exist,
because each believes himself inspired by the Divine Soul which also inspires all men.
1.2 Of the coming of John

by W. E. B. Du Bois

What bring they 'neath the midnight,  
Beside the River-sea?  
They bring the human heart wherein  
No nightly calm can be;  
That droppeth never with the wind,  
Nor drieth with the dew;  
O calm it, God; thy calm is broad  
To cover spirits too.  
The river floweth on.  
Mrs. Browning.

Carlisle Street runs westward from the centre of Johnstown, across a great black bridge, down a hill and up again, by little shops and meat-markets, past single-storied homes, until suddenly it stops against a wide green lawn. It is a broad, restful place, with two large buildings outlined against the west. When at evening the winds come swelling from the east, and the great pall of the city's smoke hangs wearily above the valley, then the red west glows like a dreamland down Carlisle Street, and, at the tolling of the supper-bell, throws the passing forms of students in dark silhouette against the sky. Tall and black, they move slowly by, and seem in the sinister light to flit before the city like dim warning ghosts. Perhaps they are; for this is Wells Institute, and these black students have few dealings with the white city below.

And if you will notice, night after night, there is one dark form that ever hurries last and late toward the twinkling lights of Swain Hall,—for Jones is never on time. A long, straggling fellow he is, brown and hard-haired, who seems to be growing straight out of his clothes, and walks with a half-apologetic roll. He used perpetually to set the quiet dining-room into waves of merriment, as he stole to his place after the bell had tapped for prayers; he seemed so perfectly awkward. And yet one glance at his face made one forgive him much,—that broad, good-natured smile in which lay no bit of art or artifice, but seemed just bubbling good-nature and genuine satisfaction with the world.

He came to us from Altamaha, away down there beneath the gnarled oaks of Southeastern Georgia, where the sea croons to the sands and the sands listen till they sink half drowned beneath the waters, rising only here and there in long, low islands. The white folk of Altamaha voted John a good boy,—fine plough-hand, good in the rice-fields, handy everywhere, and always good-natured and respectful. But they shook their heads when his mother wanted to send him off to school. "It'll spoil him,—ruin him," they said; and they talked as though they knew. But full half the black folk followed him proudly to the station, and carried his queer little trunk and many bundles. And there they shook and shook hands, and the girls kissed him shyly and the boys clapped him on the back. So the train came, and he pinched his little sister lovingly, and put his
great arms about his mother’s neck, and then was away with a puff and a roar into the great yellow world that flamed and flared about the doubtful pilgrim. Up the coast they hurried, past the squares and palmettos of Savannah, through the cotton-fields and through the weary night, to Millville, and came with the morning to the noise and bustle of Johnstown.

And they that stood behind, that morning in Altamaha, and watched the train as it noisily bore playmate and brother and son away to the world, had thereafter one ever-recurring word,—“When John comes.” Then what parties were to be, and what speakings in the churches; what new furniture in the front room,—perhaps even a new front room; and there would be a new schoolhouse, with John as teacher; and then perhaps a big wedding; all this and more,—when John comes. But the white people shook their heads.

At first he was coming at Christmas-time,—but the vacation proved too short; and then, the next summer,—but times were hard and schooling costly, and so, instead, he worked in Johnstown. And so it drifted to the next summer, and the next,—till playmates scattered, and mother grew gray, and sister went up to the Judge’s kitchen to work. And still the legend lingered,—“When John comes.”

Up at the Judge’s they rather liked this refrain; for they too had a John—a fair-haired, smooth-faced boy, who had played many a long summer’s day to its close with his darker namesake. “Yes, sir! John is at Princeton, sir,” said the broad-shouldered gray-haired Judge every morning as he marched down to the post-office. “Showing the Yankees what a Southern gentleman can do,” he added; and strode home again with his letters and papers. Up at the great pillared house they lingered long over the Princeton letter,—the Judge and his frail wife, his sister and growing daughters. “It’ll make a man of him,” said the Judge, “college is the place.” And then he asked the shy little waitress, “Well, Jennie, how’s your John?” and added reflectively, “Too bad, too bad your mother sent him off,—it will spoil him.” And the waitress wondered.

Thus in the far-away Southern village the world lay waiting, half consciously, the coming of two young men, and dreamed in an inarticulate way of new things that would be done and new thoughts that all would think. And yet it was singular that few thought of two Johns,—for the black folk thought of one John, and he was black; and the white folk thought of another John, and he was white. And neither world thought the other world’s thought, save with a vague unrest.

Up in Johnstown, at the Institute, we were long puzzled at the case of John Jones. For a long time the clay seemed unfit for any sort of moulding. He was loud and boisterous, always laughing and singing, and never able to work consecutively at anything. He did not know how to study; he had no idea of thoroughness; and with his tardiness, carelessness, and appalling good-humor, we were sore perplexed. One night we sat in faculty-meeting, worried and serious; for Jones was in trouble again. This last escapade was too much, and so we solemnly voted that Jones, on account of repeated disorder and inattention to work, be suspended for the rest of the term.

It seemed to us that the first time life ever struck Jones as a really serious thing was when the Dean told him he must leave school. He stared at the gray-haired man blankly, with great eyes. “Why,—why,” he faltered, “but—I haven’t graduated!” Then the Dean slowly and clearly explained, reminding him of the tardiness and the carelessness, of the poor lessons and neglected work, of the noise and disorder, until the fellow hung his head in confusion. Then he said quickly, “But you won’t tell mammy and sister,—you won’t write mammy, now will you? For if you won’t I’ll go out into the city and work, and come back next term and show you something.” So the Dean promised faithfully, and John shouldered his little trunk, giving neither word nor look to the giggling boys, and walked down Carlisle Street to the great city, with sober eyes and a set and serious face.

Perhaps we imagined it, but someway it seemed to us that the serious look that crept over his boyish face that afternoon never left it again. When he came back to us he went to work with all his rugged strength. It was a hard struggle, for things did not come easily to him,—few crowding memories of early life and teaching came to help him on his new way; but all the world toward which he strove was of his own building, and he builded slow and hard. As the light dawned
lingeringly on his new creations, he sat rapt and silent before the vision, or wandered alone over
the green campus peering through and beyond the world of men into a world of thought. And the
thoughts at times puzzled him sorely; he could not see just why the circle was not square, and
carried it out fifty-six decimal places one midnight,—would have gone further, indeed, had not the
matron rapped for lights out. He caught terrible colds lying on his back in the meadows of nights,
trying to think out the solar system; he had grave doubts as to the ethics of the Fall of Rome,
and strongly suspected the Germans of being thieves and rascals, despite his text-books; he
pondered long over every new Greek word, and wondered why this meant that and why it couldn’t
mean something else, and how it must have felt to think all things in Greek. So he thought and
puzzled along for himself,—pausing perplexed where others skipped merrily, and walking
steadily through the difficulties where the rest stopped and surrendered.

Thus he grew in body and soul, and with him his clothes seemed to grow and arrange them-
selves; coat sleeves got longer, cuffs appeared, and collars got less soiled. Now and then his
boots shone, and a new dignity crept into his walk. And we who saw daily a new thoughtfulness
growing in his eyes began to expect something of this plodding boy. Thus he passed out of the
preparatory school into college, and we who watched him felt four more years of change, which
almost transformed the tall, grave man who bowed to us commencement morning. He had left
his queer thought-world and come back to a world of motion and of men. He looked now for the
first time sharply about him, and wondered he had seen so little before. He grew slowly to feel
almost for the first time the Veil that lay between him and the white world; he first noticed now the
oppression that had not seemed oppression before, differences that erstwhile seemed natural,
restraints and slights that in his boyhood days had gone unnoticed or been greeted with a laugh.
He felt angry now when men did not call him “Mister,” he clenched his hands at the “Jim Crow”
cars, and chafed at the color-line that hemmed in him and his. A tinge of sarcasm crept into his
speech, and a vague bitterness into his life; and he sat long hours wondering and planning a way
around these crooked things. Daily he found himself shrinking from the choked and narrow life of
his native town. And yet he always planned to go back to Altamaha,—always planned to work
there. Still, more and more as the day approached he hesitated with a nameless dread; and
even the day after graduation he seized with eagerness the offer of the Dean to send him North
with the quartette during the summer vacation, to sing for the Institute. A breath of air before the
plunge, he said to himself in half apology.

It was a bright September afternoon, and the streets of New Y ork were brilliant with moving
men. They reminded John of the sea, as he sat in the square and watched them, so changelessly
changing, so bright and dark, so grave and gay. He scanned their rich and faultless clothes, the
way they carried their hands, the shape of their hats; he peered into the hurrying carriages. Then,
leaning back with a sigh, he said, “This is the World.” The notion suddenly seized him to see
where the world was going; since many of the richer and brighter seemed hurrying all one way.
So when a tall, light-haired young man and a little talkative lady came by, he rose half hesitatingly
and followed them. Up the street they went, past stores and gay shops, across a broad square,
until with a hundred others they entered the high portal of a great building.

He was pushed toward the ticket-office with the others, and felt in his pocket for the new five-
dollar bill he had hoarded. There seemed really no time for hesitation, so he drew it bravely out,
passed it to the busy clerk, and received simply a ticket but no change. When at last he realized
that he had paid five dollars to enter he knew not what, he stood stock-still amazed. “Be careful,”
said a low voice behind him; “you must not lynch the colored gentleman simply because he’s in
your way,” and a girl looked up roguishly into the eyes of her fair-haired escort. A shade of
annoyance passed over the escort’s face. “You will not understand us at the South,” he said half
impatiently, as if continuing an argument. “With all your professions, one never sees in the North
so cordial and intimate relations between white and black as are everyday occurrences with us.
Why, I remember my closest playfellow in boyhood was a little Negro named after me, and surely
The man stopped short and flushed to the roots of his hair, for there directly beside his reserved orchestra chairs sat the Negro he had stumbled over in the hallway. He hesitated and grew pale with anger, called the usher and gave him his card, with a few peremptory words, and slowly sat down. The lady deftly changed the subject.

All this John did not see, for he sat in a half-maze minding the scene about him; the delicate beauty of the hall, the faint perfume, the moving myriad of men, the rich clothing and low hum of talking seemed all a part of a world so different from his, so strangely more beautiful than anything he had known, that he sat in dreamland, and started when, after a hush, rose high and clear the music of Lohengrin’s swan. The infinite beauty of the wail lingered and swept through every muscle of his frame, and put it all a-tune. He closed his eyes and grasped the elbows of the chair, touching unwittingly the lady’s arm. And the lady drew away. A deep longing swelled in all his heart to rise with that clear music out of the dirt and dust of that low life that held him prisoned and befouled. If he could only live up in the free air where birds sang and setting suns had no touch of blood! Who had called him to be the slave and butt of all? And if he had called, what right had he to call when a world like this lay open before men?

Then the movement changed, and fuller, mightier harmony swelled away. He looked thoughtfully across the hall, and wondered why the beautiful gray-haired woman looked so listless, and what the little man could be whispering about. He would not like to be listless and idle, he thought, for he felt with the music the movement of power within him. If he but had some master-work, some life-service, hard,—aye, bitter hard, but without the cringing and sickening servility, without the cruel hurt that hardened his heart and soul. When at last a soft sorrow crept across the violins, there came to him the vision of a far-off home,—the great eyes of his sister, and the dark drawn face of his mother. And his heart sank below the waters, even as the sea-sand sinks by the shores of Altamaha, only to be lifted aloft again with that last ethereal wail of the swan that quivered and faded away into the sky.

It left John sitting so silent and rapt that he did not for some time notice the usher tapping him lightly on the shoulder and saying politely, “Will you step this way, please, sir?” A little surprised, he arose quickly at the last tap, and, turning to leave his seat, looked full into the face of the fair-haired young man. For the first time the young man recognized his dark boyhood playmate, and John knew that it was the Judge’s son. The white John started, lifted his hand, and then froze into his chair; the black John smiled lightly, then grimly, and followed the usher down the aisle. The manager was sorry, very, very sorry,—but he explained that some mistake had been made in selling the gentleman a seat already disposed of; he would refund the money, of course,—and indeed felt the matter keenly, and so forth, and,—before he had finished John was gone, walking hurriedly across the square and down the broad streets, and as he passed the park he buttoned his coat and said, “John Jones, you’re a natural-born fool.” Then he went to his lodgings and wrote a letter, and tore it up; he wrote another, and threw it in the fire. Then he seized a scrap of paper and wrote: “Dear Mother and Sister—I am coming—John.”

Perhaps,” said John, as he settled himself on the train, “perhaps I am to blame myself in struggling against my manifest destiny simply because it looks hard and unpleasant. Here is my duty to Altamaha plain before me; perhaps they’ll let me help settle the Negro problems there,—perhaps they won’t. ‘I will go in to the King, which is not according to the law; and if I perish, I perish.’ ” And then he mused and dreamed, and planned a life-work; and the train flew south.

Down in Altamaha, after seven long years, all the world knew John was coming. The homes were scrubbed and scoured,—above all, one; the gardens and yards had an unwonted trimness, and Jennie bought a new gingham. With some finesse and negotiation, all the dark Methodists and Presbyterians were induced to join in a monster welcome at the Baptist Church; and as the day drew near, warm discussions arose on every corner as to the exact extent and nature of John’s accomplishments. It was noontide on a gray and cloudy day when he came. The black town flocked to the depot, with a little of the white at the edges,—a happy throng, with “Good-mawnings”
and “Howdys” and laughing and joking and jesting. Mother sat yonder in the window watching; but sister Jennie stood on the platform, nervously fingerling her dress,—tall and lithe, with soft brown skin and loving eyes peering from out a tangled wilderness of hair. John rose gloomily as the train stopped, for he was thinking of the “Jim Crow” car; he stepped to the platform, and paused: a little dingy station, a black crowd gaudy and dirty, a half-mile of dilapidated shanties along a straggling ditch of mud. An overwhelming sense of the sordidness and narrowness of it all seized him; he looked in vain for his mother, kissed coldly the tall, strange girl who called him brother, spoke a short, dry word here and there; then, lingering neither for hand-shaking nor gossip, started silently up the street, raising his hat merely to the last eager old aunty, to her open-mouthed astonishment. The people were distinctly bewildered. This silent, cold man,—was this John? Where was his smile and hearty hand-grasp? " 'Peared kind o' down in the mouf," said the Methodist preacher thoughtfully. "Seemed monstus stuck up," complained a Baptist sister. But the white postmaster from the edge of the crowd expressed the opinion of his folks plainly. "That damn Nigger," said he, as he shouldered the mail and arranged his tobacco, "has gone North and got plum full o' fool notions; but they won't work in Altamaha." And the crowd melted away.

The meeting of welcome at the Baptist Church was a failure. Rain spoiled the barbecue, and thunder turned the milk in the ice-cream. When the speaking came at night, the house was crowded to overflowing. The three preachers had especially prepared themselves, but somehow John’s manner seemed to throw a blanket over everything,—he seemed so cold and preoccupied, and had so strange an air of restraint that the Methodist brother could not warm up to his theme and elicited not a single “Amen”; the Presbyterian prayer was but feebly responded to, and even the Baptist preacher, though he wakened faint enthusiasm, got so mixed up in his favorite sentence that he had to close it by stopping fully fifteen minutes sooner than he meant. The people moved uneasily in their seats as John rose to reply. He spoke slowly and methodically. The age, he said, demanded new ideas; we were far different from those men of the seventeenth and eighteenth centuries,—with broader ideas of human brotherhood and destiny. Then he spoke of the rise of charity and popular education, and particularly of the spread of wealth and work. The question was, then, he added reflectively, looking at the low discolored ceiling, what part the Negroes of this land would take in the striving of the new century. He sketched in vague outline the new Industrial School that might rise among these pines, he spoke in detail of the charitable and philanthropic work that might be organized, of money that might be saved for banks and business. Finally he urged unity, and deprecated especially religious and denominational bickering. “To-day,” he said, with a smile, “the world cares little whether a man be Baptist or Methodist, or indeed a churchman at all, so long as he is good and true. What difference does it make whether a man be baptized in river or wash-bowl, or not at all? Let’s leave all that littleness, and look higher.” Then, thinking of nothing else, he slowly sat down. A painful hush seized that crowded mass. Little had they understood of what he said, for he spoke an unknown tongue, save the last word about baptism; that they knew, and they sat very still while the clock ticked. Then at last a low suppressed snarl came from the Amen corner, and an old bent man arose, walked over the seats, and climbed straight up into the pulpit. He was wrinkled and black, with scant gray and tufted hair; his voice and hands shook as with palsy; but on his face lay the intense rapt look of the religious fanatic. He seized the Bible with his rough, huge hands; twice he raised it inarticulate, and then fairly burst into the words, with rude and awful eloquence. He quivered, swayed, and bent; then rose aloft in perfect majesty, till the people moaned and wept, wailed and shouted, and a wild shrieking arose from the corners where all the pent-up feeling of the hour gathered itself and rushed into the air. John never knew clearly what the old man said; he only felt himself held up to scorn and scathing denunciation for trampling on the true Religion, and he realized with amazement that all unknowingly he had put rough, rude hands on something this little world held sacred. He arose silently, and passed out into the night. Down toward the sea he went, in the fitful starlight, half conscious of the girl who followed timidly after him. When at last he stood upon the
bluff, he turned to his little sister and looked upon her sorrowfully, remembering with sudden pain how little thought he had given her. He put his arm about her and let her passion of tears spend itself on his shoulder.

Long they stood together, peering over the gray unresting water.

"John," she said, "does it make every one—unhappy when they study and learn lots of things?"

He paused and smiled, "I am afraid it does," he said.

"And, John, are you glad you studied?"

"Yes," came the answer, slowly but positively.

She watched the flickering lights upon the sea, and said thoughtfully, "I wish I was unhappy,—and—and," putting both arms about his neck, "I think I am, a little, John."

It was several days later that John walked up to the Judge’s house to ask for the privilege of teaching the Negro school. The Judge himself met him at the front door, stared a little hard at him, and said brusquely, "Go ’round to the kitchen door, John, and wait." Sitting on the kitchen steps, John stared at the corn, thoroughly perplexed. What on earth had come over him? Every step he made offended some one. He had come to save his people, and before he left the depot he had hurt them. He sought to teach them at the church, and had outraged their deepest feelings. He had schooled himself to be respectful to the Judge, and then blundered into his front door. And all the time he had meant right,—and yet, and yet, somehow he found it so hard and strange to fit his old surroundings again, to find his place in the world about him. He could not remember that he used to have any difficulty in the past, when life was glad and gay. The world seemed smooth and easy then. Perhaps,—but his sister came to the kitchen door just then and said the Judge awaited him.

The Judge sat in the dining-room amid his morning’s mail, and he did not ask John to sit down. He plunged squarely into the business. "You’ve come for the school, I suppose. Well, John, I want to speak to you plainly. You know I’m a friend to your people. I’ve helped you and your family, and would have done more if you hadn’t got the notion of going off. Now I like the colored people, and sympathize with all their reasonable aspirations; but you and I both know, John, that in this country the Negro must remain subordinate, and can never expect to be the equal of white men. In their place, your people can be honest and respectful; and God knows, I’ll do what I can to help them. But when they want to reverse nature, and rule white men, and marry white women, and sit in my parlor, then, by God! we’ll hold them under if we have to lynch every Nigger in the land. Now, John, the question is, are you, with your education and Northern notions, going to accept the situation and teach the darkies to be faithful servants and laborers as your fathers were,—I knew your father, John, he belonged to my brother, and he was a good Nigger. Well—well, are you going to be like him, or are you going to try to put fool ideas of rising and equality into these folks’ heads, and make them discontented and unhappy?"

"I am going to accept the situation, Judge Henderson," answered John, with a brevity that did not escape the keen old man. He hesitated a moment, and then said shortly, "Very well,—we’ll try you awhile. Good-morning."

It was a full month after the opening of the Negro school that the other John came home, tall, gay, and headstrong. The mother wept, the sisters sang. The whole white town was glad. A proud man was the Judge, and it was a goodly sight to see the two swinging down Main Street together. And yet all did not go smoothly between them, for the younger man could not and did not veil his contempt for the little town, and plainly had his heart set on New York. Now the one cherished ambition of the Judge was to see his son mayor of Altamaha, representative to the legislature, and—who could say?—governor of Georgia. So the argument often waxed hot between them.

"Good heavens, father," the younger man would say after dinner, as he lighted a cigar and stood by the fireplace, "you surely don’t expect a young fellow like me to settle down permanently in this—this God-forgotten town with nothing but mud and Negroes?" "I did," the Judge would answer laconically; and on this particular day it seemed from the gathering scowl that he was about to
add something more emphatic, but neighbors had already begun to drop in to admire his son, and the conversation drifted.

“Heah that John is livin’ things up at the darky school,” volunteered the postmaster, after a pause.

“What now?” asked the Judge, sharply.

“Oh, nothin’ in particular,—just his almighty air and uppish ways. B’lieve I did heah somethin’ about his givin’ talks on the French Revolution, equality, and such like. He’s what I call a dangerous Nigger.”

“What now?” interjected the son.

“Why, it’s little black John, Peggy’s son,—your old playfellow.”

The young man’s face flushed angrily, and then he laughed.

“Oh,” said he, “it’s the darky that tried to force himself into a seat beside the lady I was escorting—”

But Judge Henderson waited to hear no more. He had been nettled all day, and now at this he rose with a half-smothered oath, took his hat and cane, and walked straight to the schoolhouse.

For John, it had been a long, hard pull to get things started in the rickety old shanty that sheltered his school. The Negroes were rent into factions for and against him, the parents were careless, the children irregular and dirty, and books, pencils, and slates largely missing. Nevertheless, he struggled hopefully on, and seemed to see at last some glimmering of dawn. The attendance was larger and the children were a shade cleaner this week. Even the booby class in reading showed a little comforting progress. So John settled himself with renewed patience this afternoon.

“Now, Mandy,” he said cheerfully, “that’s better; but you mustn’t chop your words up so: ‘If the man—’”

“Naw, suh, he cain’t talk.”

“All right; now let’s try again: ‘If the man—’”

“John!”

The whole school started in surprise, and the teacher half arose, as the red, angry face of the Judge appeared in the open doorway.

“John, this school is closed. You children can go home and get to work. The white people of Altamaha are not spending their money on black folks to have their heads crammed with impudence and lies. Clear out! I’ll lock the door myself.”

Up at the great pillared house the tall young son wandered aimlessly about after his father’s abrupt departure. In the house there was little to interest him; the books were old and stale, the local newspaper flat, and the women had retired with headaches and sewing. He tried a nap, but it was too warm. So he sauntered out into the fields, complaining disconsolately, “Good Lord! how long will this imprisonment last!” He was not a bad fellow,—just a little spoiled and self-indulgent, and as headstrong as his proud father. He seemed a young man pleasant to look upon, as he sat on the great black stump at the edge of the pines idly swinging his legs and smoking. “Why, there isn’t even a girl worth getting up a respectable flirtation with,” he growled. Just then his eye caught a tall, willowy figure hurrying toward him on the narrow path. He looked with interest at first, and then burst into a laugh as he said, “Well, I declare, if it isn’t Jennie, the little brown kitchen-maid! Why, I never noticed before what a trim little body she is. Hello, Jennie! Why, you haven’t kissed me since I came home,” he said gaily. The young girl stared at him in surprise and confusion,—faltered something inarticulate, and attempted to pass. But a wilful mood had seized the young idler, and he caught at her arm. Frightened, she slipped by; and half mischievously he turned and ran after her through the tall pines.

Yonder, toward the sea, at the end of the path, came John slowly, with his head down. He had
turned wearily homeward from the schoolhouse; then, thinking to shield his mother from the blow, started to meet his sister as she came from work and break the news of his dismissal to her. “I’ll go away,” he said slowly; “I’ll go away and find work, and send for them. I cannot live here longer.” And then the fierce, buried anger surged up into his throat. He waved his arms and hurried wildly up the path.

The great brown sea lay silent. The air scarce breathed. The dying day bathed the twisted oaks and mighty pines in black and gold. There came from the wind no warning, not a whisper from the cloudless sky. There was only a black man hurrying on with an ache in his heart, seeing neither sun nor sea, but starting as from a dream at the frightened cry that woke the pines, to see his dark sister struggling in the arms of a tall and fair-haired man.

He said not a word, but, seizing a fallen limb, struck him with all the pent-up hatred of his great black arm; and the body lay white and still beneath the pines, all bathed in sunshine and in blood. John looked at it dreamily, then walked back to the house briskly, and said in a soft voice, “Mammy, I’m going away,—I’m going to be free.”

She gazed at him dimly and faltered, “No’th, honey, is yo’ gwine No’th agin?”

He looked out where the North Star glistened pale above the waters, and said, “Yes, mammy, I’m going—North.”

Then, without another word, he went out into the narrow lane, up by the straight pines, to the same winding path, and seated himself on the great black stump, looking at the blood where the body had lain. Yonder in the gray past he had played with that dead boy, romping together under the solemn trees. The night deepened; he thought of the boys at Johnstown. He wondered how Brown had turned out, and Carey? And Jones,—Jones? Why, he was Jones, and he wondered what they would all say when they knew, when they knew, in that great long dining-room with its hundreds of merry eyes. Then as the sheen of the starlight stole over him, he thought of the gilded ceiling of that vast concert hall, and heard stealing toward him the faint sweet music of the swan. Hark! was it music, or the hurry and shouting of men? Yes, surely! Clear and high the faint sweet melody rose and fluttered like a living thing, so that the very earth trembled as with the tramp of horses and murmur of angry men.

He leaned back and smiled toward the sea, whence rose the strange melody, away from the dark shadows where lay the noise of horses galloping, galloping on. With an effort he roused himself, bent forward, and looked steadily down the pathway, softly humming the “Song of the Bride,”—

Freudig geführt, ziehet dahin.

Amid the trees in the dim morning twilight he watched their shadows dancing and heard their horses thundering toward him, until at last they came sweeping like a storm, and he saw in front that haggard white-haired man, whose eyes flashed red with fury. Oh, how he pitied him,—pitied him,—and wondered if he had the coiling twisted rope. Then, as the storm burst round him, he rose slowly to his feet and turned his closed eyes toward the Sea.

And the world whistled in his ears.
1.3 Socialized education

Jane Addams

In a paper written years ago I deplored at some length the fact that educational matters are more democratic in their political than in their social aspect, and I quote the following extract from it as throwing some light upon the earlier educational undertakings at Hull-House:—

Teaching in a Settlement requires distinct methods, for it is true of people who have been allowed to remain undeveloped and whose facilities are inert and sterile, that they cannot take their learning heavily. It has to be diffused in a social atmosphere, information must be held in solution, in a medium of fellowship and good will.

Intellectual life requires for its expansion and manifestation the influences and assimilation of the interests and affections of others. Mazzini, that greatest of all democrats, who broke his heart over the condition of the South European peasantry, said: "Education is not merely a necessity of true life by which the individual renews his vital force in the vital force of humanity; it is a Holy Communion with generations dead and living, by which he fecundates all his faculties. When he is withheld from this Communion for generations, as the Italian peasant has been, we say, 'He is like a beast of the field; he must be controlled by force.'" Even to this it is sometimes added that it is absurd to educate him, immoral to disturb his content. We stupidly use the effect as an argument for a continuance of the cause. It is needless to say that a Settlement is a protest against a restricted view of education.

In line with this declaration, Hull-House in the very beginning opened what we called College Extension Classes with a faculty finally numbering thirty-five college men and women, many of whom held their pupils for consecutive years. As these classes antedated in Chicago the University Extension and Normal Extension classes and supplied a demand for stimulating instruction, the attendance strained to their utmost capacity the spacious rooms in the old house. The relation of students and faculty to each other and to the residents was that of guest and hostess, and at the close of each term the residents gave a reception to students and faculty which was one of the chief social events of the season. Upon this comfortable social basis some very good work was done.

In connection with these classes a Hull-House summer school was instituted at Rockford College, which was most generously placed at our disposal by the trustees. For ten years one hundred women gathered there for six weeks, in addition there were always men on the faculty, and a small group of young men among the students who were lodged in the gymnasium building. The outdoor classes in bird study and botany, the serious reading of literary masterpieces, the boat excursions on the Rock River, the cooperative spirit of doing the housework together, the satirical commencements in parti-colored caps and gowns, lent themselves toward a reproduction of the comradeship which college life fosters.

As each member of the faculty, as well as the students, paid three dollars a week, and as we
had little outlay beyond the actual cost of food, we easily defrayed our expenses. The undertaking was so simple and gratifying in results that it might well be reproduced in many college buildings which are set in the midst of beautiful surroundings, unused during the two months of the year when hundreds of people, able to pay only a moderate price for lodgings in the country, can find nothing comfortable and no mental food more satisfying than piazza gossip.

Every Thursday evening during the first years, a public lecture came to be an expected event in the neighborhood, and Hull-House became one of the early University Extension centers, first in connection with an independent society and later with the University of Chicago. One of the Hull-House trustees was so impressed with the value of this orderly and continuous presentation of economic subjects that he endowed three courses in a downtown center, in which the lectures were free to anyone who chose to come. He was much pleased that these lectures were largely attended by workingmen who ordinarily prefer that an economic subject shall be presented by a partisan, and who are supremely indifferent to examinations and credits. They also dislike the balancing of pro and con which scholarly instruction implies, and prefer to be “inebriated on raw truth” rather than to sip a carefully prepared draught of knowledge.

Nevertheless Bowen Hall, which seats seven hundred and fifty people, is often none too large to hold the audiences of men who come to Hull-House every Sunday evening during the winter to attend the illustrated lectures provided by the faculty of the University of Chicago and others who kindly give their services. These courses differ enormously in their popularity: one on European capitals and their social significance was followed with the most vivid attention and sense of participation indicated by groans and hisses when the audience was reminded of an unforgettable feud between Austria and her Slavic subjects, or when they wildly applauded a Polish hero endeared through his tragic failure.

In spite of the success of these Sunday evening courses, it has never been an easy undertaking to find acceptable lectures. A course of lectures on astronomy illustrated by stereopticon slides will attract a large audience the first week, who hope to hear of the wonders of the heavens and the relation of our earth thereto, but instead are treated to spectrum analyses of star dust, or the latest theory concerning the milky way. The habit of research and the desire to say the latest word upon any subject often overcomes the sympathetic understanding of his audience which the lecturer might otherwise develop, and he insensibly drops into the dull terminology of the classroom. There are, of course, notable exceptions; we had twelve gloriously popular talks on organic evolution, but the lecturer was not yet a professor—merely a university instructor—and his mind was still eager over the marvel of it all. Fortunately there is an increasing number of lecturers whose matter is so real, so definite, and so valuable, that in an attempt to give it an exact equivalence in words, they utilize the most direct forms of expression.

It sometimes seems as if the men of substantial scholarship were content to leave to the charlatan the teaching of those things which deeply concern the welfare of mankind, and that the mass of men get their intellectual food from the outcasts of scholarship, who provide millions of books, pictures, and shows, not to instruct and guide, but for the sake of their own financial profit. A Settlement soon discovers that simple people are interested in large and vital subjects, and the Hull-House residents themselves at one time, with only partial success, undertook to give a series of lectures on the history of the world, beginning with the nebular hypothesis and reaching Chicago itself in the twenty-fifth lecture! Absurd as the hasty review appears, there is no doubt that the beginner in knowledge is always eager for the general statement, as those wise old teachers of the people well knew, when they put the history of creation on the stage and the monks themselves became the actors. I recall that in planning my first European journey I had soberly hoped in two years to trace the entire pattern of human excellence as we passed from one country to another, in the shrines popular affection had consecrated to the saints, in the frequented statues erected to heroes, and in the “worn blasonry of funeral brasses”—an illustration that when we are young we all long for those mountaintops upon which we may soberly stand and dream of our
own ephemeral and uncertain attempts at righteousness. I have had many other illustrations of this; a statement was recently made to me by a member of the Hull-House Boys’ club, who had been unjustly arrested as an accomplice to a young thief and held in the police station for three days, that during his detention he “had remembered the way Jean Valjean behaved when he was everlastingly pursued by that policeman who was only trying to do right”; “I kept seeing the pictures in that illustrated lecture you gave about him, and I thought it would be queer if I couldn’t behave well for three days when he had kept it up for years.”

The power of dramatic action may unfortunately be illustrated in other ways. During the weeks when all the daily papers were full of the details of a notorious murder trial in New York and all the hideous events which preceded the crime, one evening I saw in the street a knot of working girls leaning over a newspaper, admiring the clothes, the beauty, and “sorrowful expression” of the unhappy heroine. In the midst of the trial a woman whom I had known for years came to talk to me about her daughter, shamefacedly confessing that the girl was trying to dress and look like the notorious girl in New York, and that she had even said to her mother in a moment of defiance, “Some day I shall be taken into court and then I shall dress just as Evelyn did and face my accusers as she did in innocence and beauty.”

If one makes calls on a Sunday afternoon in the homes of the immigrant colonies near Hull-House, one finds the family absorbed in the Sunday edition of a sensational daily newspaper, even those who cannot read, quite easily following the comic adventures portrayed in the colored pictures of the supplement or tracing the clew of a murderer carefully depicted by a black line drawn through a plan of the houses and streets.

Sometimes lessons in the great loyalties and group affections come through life itself and yet in such a manner that one cannot but deplore it. During the teamsters’ strike in Chicago several years ago when class bitterness rose to a dramatic climax, I remember going to visit a neighborhood boy who had been severely injured when he had taken the place of a union driver upon a coal wagon. As I approached the house in which he lived, a large group of boys and girls, some of them very little children, surrounded me to convey the exciting information that “Jack T. was a ‘scab’,” and that I couldn’t go in there. I explained to the excited children that his mother, who was a friend of mine, was in trouble, quite irrespective of the way her boy had been hurt. The crowd around me outside of the house of the “scab” constantly grew larger and I, finally abandoning my attempt at explanation, walked in only to have the mother say: “Please don’t come here. You will only get hurt, too.” Of course I did not get hurt, but the episode left upon my mind one of the most painful impressions I have ever received in connection with the children of the neighborhood. In addition to all else are the lessons of loyalty and comradeship to come to them as the mere reversals of class antagonism? And yet it was but a trifling incident out of the general spirit of bitterness and strife which filled the city.

Therefore the residents of Hull-House place increasing emphasis upon the great inspirations and solaces of literature and are unwilling that it should ever languish as a subject for class instruction or for reading parties. The Shakespeare club has lived a continuous existence at Hull-House for sixteen years during which time its members have heard the leading interpreters of Shakespeare, both among scholars and players. I recall that one of its earliest members said that her mind was peopled with Shakespeare characters during her long hours of sewing in a shop, that she couldn’t remember what she thought about before she joined the club, and concluded that she hadn’t thought about anything at all. To feed the mind of the worker, to lift it above the monotony of his task, and to connect it with the larger world, outside of his immediate surroundings, has always been the object of art, perhaps never more nobly fulfilled than by the great English bard. Miss Starr has held classes in Dante and Browning for many years, and the great lines are conned with never failing enthusiasm. I recall Miss Lathrop’s Plato club and an audience who listened to a series of lectures by Dr. John Dewey on “Social Psychology” as genuine intellectual groups consisting largely of people from the immediate neighborhood, who were
willing to make “that effort from which we all shrink, the effort of thought.” But while we prize these
classes as we do the help we are able to give to the exceptional young man or woman who
reaches the college and university and leaves the neighborhood of his childhood behind him, the
residents of Hull-House feel increasingly that the educational efforts of a Settlement should not
be directed primarily to reproduce the college type of culture, but to work out a method and an
ideal adapted to the immediate situation. They feel that they should promote a culture which will
not set its possessor aside in a class with others like himself, but which will, on the contrary,
connect him with all sorts of people by his ability to understand them as well as by his power to
supplement their present surroundings with the historic background. Among the hundreds of
immigrants who have for years attended classes at Hull-House designed primarily to teach the
English language, dozens of them have struggled to express in the newly acquired tongue some
of these hopes and longings which had so much to do with their emigration.

A series of plays was thus written by a young Bohemian; essays by a Russian youth, outpouring
sorrows rivaling Werther himself and yet containing the precious stuff of youth’s perennial revolt
against accepted wrong; stories of Russian oppression and petty injustices throughout which
the desire for free America became a crystallized hope; an attempt to portray the Jewish day of
Atonement, in such wise that even individualistic Americans may catch a glimpse of that deeper
national life which has survived all transplanting and expresses itself in forms so ancient that they
appear grotesque to the ignorant spectator. I remember a pathetic effort on the part of a young
Russian Jewess to describe the vivid inner life of an old Talmud scholar, probably her uncle or
father, as of one persistently occupied with the grave and important things of the spirit, although
when brought into sharp contact with busy and overworked people, he inevitably appeared self-
absorbed and slothful. Certainly no one who had read her paper could again see such an old man
in his praying shawl bent over his crabbed book, without a sense of understanding.

On the other hand, one of the most pitiful periods in the drama of the much-praised young
American who attempts to rise in life, is the time when his educational requirements seem to have
locked him up and made him rigid. He fancies himself shut off from his uneducated family and
misunderstood by his friends. He is bowed down by his mental accumulations and often gets no
farther than to carry them through life as a great burden, and not once does he obtain a glimpse
of the delights of knowledge.

The teacher in a Settlement is constantly put upon his mettle to discover methods of instruction
which shall make knowledge quickly available to his pupils, and I should like here to pay my
tribute of admiration to the dean of our educational department, Miss Landsberg, and to the many
men and women who every winter come regularly to Hull-House, putting untiring energy into the
endless task of teaching the newly arrived immigrant the first use of a language of which he has
such desperate need. Even a meager knowledge of English may mean an opportunity to work
in a factory versus nonemployment, or it may mean a question of life or death when a sharp
command must be understood in order to avoid the danger of a descending crane.

In response to a demand for an education which should be immediately available, classes
have been established and grown apace in cooking, dressmaking, and millinery. A girl who attends
them will often say that she “expects to marry a workingman next spring,” and because she has
worked in a factory so long she knows “little about a house.” Sometimes classes are composed of
young matrons of like factory experiences. I recall one of them whose husband had become so
desperate after two years of her unskilled cooking that he had threatened to desert her and go
where he could get “decent food,” as she confided to me in a tearful interview, when she followed
my advice to take the Hull-House courses in cooking, and at the end of six months reported a
united and happy home.

Two distinct trends are found in response to these classes; the first is for domestic training,
and the other is for trade teaching which shall enable the poor little milliner and dressmaker
apprentices to shorten the years of errand running which is supposed to teach them their trade.
The beginning of trade instruction has been already evolved in connection with the Hull-House Boys’ club. The ample Boys’ club building presented to Hull-House three years ago by one of our trustees has afforded well-equipped shops for work in wood, iron, and brass; for smithing in copper and tin; for commercial photography, for printing, for telegraphy, and electrical construction. These shops have been filled with boys who are eager for that which seems to give them a clew to the industrial life all about them. These classes meet twice a week and are taught by intelligent workingmen who apparently give the boys what they want better than do the strictly professional teachers. While these classes in no sense provide a trade training, they often enable a boy to discover his aptitude and help him in the selection of what he “wants to be” by reducing the trades to embryonic forms. The factories are so complicated that the boy brought in contact with them, unless he has some preliminary preparation, is apt to become confused. In pedagogical terms, he loses his “power of orderly reaction” and is often so discouraged or so overstimulated in his very first years of factory life that his future usefulness is seriously impaired.

One of Chicago’s most significant experiments in the direction of correlating the schools with actual industry was for several years carried on in a public school building situated near Hull-House, in which the bricklayers’ apprentices were taught eight hours a day in special classes during the non-bricklaying season. This early public school venture anticipated the very successful arrangement later carried on in Cincinnati, in Pittsburgh and in Chicago itself, whereby a group of boys at work in a factory alternate month by month with another group who are in school and are thus intelligently conducted into the complicated processes of modern industry. But for a certain type of boy who has been demoralized by the constant change and excitement of street life, even these apprenticeship classes are too strenuous, and he has to be lured into the path of knowledge by all sorts of appeals.

It sometimes happens that boys are held in the Hull-House classes for weeks by their desire for the excitement of placing burglar alarms under the door mats. But to enable the possessor of even a little knowledge to thus play with it, is to decoy his feet at least through the first steps of the long, hard road of learning, although even in this, the teacher must proceed warily. A typical street boy who was utterly absorbed in a wood-carving class, abruptly left never to return when he was told to use some simple calculations in the laying out of the points. He evidently scented the approach of his old enemy, arithmetic, and fled the field. On the other hand, we have come across many cases in which boys have vainly tried to secure such opportunities for themselves. During the trial of a boy of ten recently arrested for truancy, it developed that he had spent many hours watching the electrical construction in a downtown building, and many others in the public library “reading about electricity.” Another boy who was taken from school early, when his father lost both of his legs in a factory accident, tried in vain to find a place for himself “with machinery.” He was declared too small for any such position, and for four years worked as an errand boy, during which time he steadily turned in his unopened pay envelope for the use of the household. At the end of the fourth year the boy disappeared, to the great distress of his invalid father and his poor mother whose day washings became the sole support of the family. He had beaten his way to Kansas City, hoping “they wouldn’t be so particular there about a fellow’s size.” He came back at the end of six weeks because he felt sorry for his mother who, aroused at last to a realization of his unbending purpose, applied for help to the Juvenile Protective Association. They found a position for the boy in a machine shop and an opportunity for evening classes.

Out of the fifteen hundred members of the Hull-House Boys’ club, hundreds seem to respond only to the opportunities for recreation, and many of the older ones apparently care only for the bowling and the billiards. And yet tournaments and match games under supervision and regulated hours are a great advance over the sensual and exhausting pleasures to be found so easily outside the club. These organized sports readily connect themselves with the Hull-House gymnasium and with all those enthusiasms which are so mysteriously aroused by athletics.

Our gymnasium has been filled with large and enthusiastic classes for eighteen years in spite
of the popularity of dancing and other possible substitutes, while the Saturday evening athletic contests have become a feature of the neighborhood. The Settlement strives for that type of gymnastics which is at least partly a matter of character, for that training which presupposes abstinence and the curbing of impulse, as well as for those athletic contests in which the mind of the contestant must be vigilant to keep the body closely to the rules of the game. As one sees in rhythmic motion the slim bodies of a class of lads, “that scrupulous and uncontaminate purity of form which recommended itself even to the Greeks as befitting messengers from the gods, if such messengers should come,” one offers up in awkward prosaic form the very essence of that old prayer, “Grant them with feet so light to pass through life.” But while the glory stored up for Olympian winners was at the most a handful of parsley, an ode, fame for family and city, on the other hand, when the men and boys from the Hull-House gymnasium bring back their cups and medals, one’s mind is filled with something like foreboding in the reflection that too much success may lead the winners into the professionalism which is so associated with betting and so close to pugilism. Candor, however, compels me to state that a long acquaintance with the acrobatic folk who have to do with the circus, a large number of whom practice in our gymnasium every winter, has raised our estimate of that profession.

Young people who work long hours at sedentary occupations, factories and offices, need perhaps more than anything else the freedom and ease to be acquired from a symmetrical muscular development and are quick to respond to that fellowship which athletics apparently affords more easily than anything else. The Greek immigrants form large classes and are eager to reproduce the remnants of old methods of wrestling, and other bits of classic lore which they still possess, and when one of the Greeks won a medal in a wrestling match which represented the championship of the entire city, it was quite impossible that he should present it to the Hull-House trophy chest without a classic phrase which he recited most gravely and charmingly.

It was in connection with a large association of Greek lads that Hull-House finally lifted its long restriction against military drill. If athletic contests are the residuum of warfare first waged against the conqueror without and then against the tyrants within the State, the modern Greek youth is still in the first stage so far as his inherited attitude against the Turk is concerned. Each lad believes that at any moment he may be called home to fight this long-time enemy of Greece. With such a genuine motive at hand, it seemed mere affectation to deny the use of our boys’ club building and gymnasium for organized drill, although happily it forms but a small part of the activities of the Greek Educational Association.

Having thus confessed to military drill countenanced if not encouraged at Hull-House, it is perhaps only fair to relate an early experience of mine with the “Columbian Guards,” an organization of the World’s Fair summer. Although the Hull-House squad was organized as the others were with the motto of a clean city, it was very anxious for military drill. This request not only shocked my nonresistant principles, but seemed to afford an opportunity to find a substitute for the military tactics which were used in the boys’ brigades everywhere, even in those connected with churches. As the cleaning of the filthy streets and alleys was the ostensible purpose of the Columbian guards, I suggested to the boys that we work out a drill with sewer spades, which with their long narrow blades and shortened handles were not so unlike bayonetted guns in size, weight, and general appearance, but that much of the usual military drill could be readapted. While I myself was present at the gymnasium to explain that it was nobler to drill in imitation of removing disease-breeding filth than to drill in simulation of warfare; while I distractedly readapted tales of chivalry to this modern rescuing of the endangered and distressed, the new drill went forward in some sort of fashion, but so surely as I withdrew, the drillmaster would complain that our troops would first grow self-conscious, then demoralized, and finally flatly refuse to go on. Throughout the years since the failure of this Quixotic experiment, I occasionally find one of these sewer spades in a Hull-House storeroom, too truncated to be used for its original purpose and too prosaic to serve the purpose for which it was bought. I can only look at it in the forlorn hope that it
may foreshadow that piping time when the weapons of warfare shall be turned into the implements of civic salvation.

Before closing this chapter on Socialized Education, it is only fair to speak of the education accruing to the Hull-House residents themselves during their years of living in what at least purports to be a center for social and educational activity.

While a certain number of the residents are primarily interested in charitable administration and the amelioration which can be suggested only by those who know actual conditions, there are other residents identified with the House from its earlier years to whom the groups of immigrants make the historic appeal, and who use, not only their linguistic ability, but all the resource they can command of travel and reading to qualify themselves for intelligent living in the immigrant quarter of the city. I remember one resident lately returned from a visit in Sicily, who was able to interpret to a bewildered judge the ancient privilege of a jilted lover to scratch the cheek of his faithless sweetheart with the edge of a coin. Although the custom in America had degenerated into a knife slashing after the manner of foreign customs here, and although the Sicilian deserved punishment, the incident was yet lifted out of the slough of mere brutal assault, and the interpretation won the gratitude of many Sicilians.

There is no doubt that residents in a Settlement too often move toward their ends “with hurried and ignoble gait,” putting forth thorns in their eagerness to bear grapes. It is always easy for those in pursuit of ends which they consider of overwhelming importance to become themselves thin and impoverished in spirit and temper, to gradually develop a dark mistaken eagerness alternating with fatigue, which supersedes “the great and gracious ways” so much more congruous with worthy aims.

Partly because of this universal tendency, partly because a Settlement shares the perplexities of its times and is never too dogmatic concerning the final truth, the residents would be glad to make the daily life at the Settlement “conform to every shape and mode of excellence.”

It may not be true

That the good are always the merry
Save by an evil chance,

but a Settlement would make clear that one need not be heartless and flippant in order to be merry, nor solemn in order to be wise. Therefore quite as Hull-House tries to redeem billiard tables from the association of gambling, and dancing from the temptations of the public dance halls, so it would associate with a life of upright purpose those more engaging qualities which in the experience of the neighborhood are too often connected with dubious aims.

Throughout the history of Hull-House many inquiries have been made concerning the religion of the residents, and the reply that they are as diversified in belief and in the ardor of the inner life as any like number of people in a college or similar group, apparently does not carry conviction. I recall that after a house for men residents had been opened on Polk Street and the residential force at Hull-House numbered twenty, we made an effort to come together on Sunday evenings in a household service, hoping thus to express our moral unity in spite of the fact that we represented many creeds. But although all of us reverently knelt when the High Church resident read the evening service and bowed our heads when the evangelical resident led in prayer after his chapter, and although we sat respectfully through the twilight when a resident read her favorite passages from Plato and another from Abt Vogler, we concluded at the end of the winter that this was not religious fellowship and that we did not care for another reading club. So it was reluctantly given up, and we found that it was quite as necessary to come together on the basis of the deed and our common aim inside the household as it was in the neighborhood itself. I once had a conversation on the subject with the warden of Oxford House, who kindly invited me to the evening service held for the residents in a little chapel on the top floor of the Settlement. All the residents
were High Churchmen to whom the service was an important and reverent part of the day. Upon my reply to a query of the warden that the residents of Hull-House could not come together for religious worship because there were among us Jews, Roman Catholics, English Churchmen, Dissenters, and a few agnostics, and that we had found unsatisfactory the diluted form of worship which we could carry on together, he replied that it must be most difficult to work with a group so diversified, for he depended upon the evening service to clear away any difficulties which the day had involved and to bring the residents to a religious consciousness of their common aim. I replied that this diversity of creed was part of the situation in American Settlements, as it was our task to live in a neighborhood of many nationalities and faiths, and that it might be possible that among such diversified people it was better that the Settlement corps should also represent varying religious beliefs.

A wise man has told us that “men are once for all so made that they prefer a rational world to believe in and to live in,” but that it is no easy matter to find a world rational as to its intellectual, aesthetic, moral, and practical aspects. Certainly it is no easy matter if the place selected is of the very sort where the four aspects are apparently furthest from perfection, but an undertaking resembling this is what the Settlement gradually becomes committed to, as its function is revealed through the reaction on its consciousness of its own experiences. Because of this fourfold undertaking, the Settlement has gathered into residence people of widely diversified tastes and interests, and in Hull-House, at least, the group has been surprisingly permanent. The majority of the present corps of forty residents support themselves by their business and professional occupations in the city, giving only their leisure time to Settlement undertakings. This in itself tends to continuity of residence and has certain advantages. Among the present staff, of whom the larger number have been in residence for more than twelve years, there are the secretary of the City club, two practicing physicians, several attorneys, newspapermen, businessmen, teachers, scientists, artists, musicians, lecturers in the School of Civics and Philanthropy, officers in The Juvenile Protective Association and in The League for the Protection of Immigrants, a visiting nurse, a sanitary inspector, and others.

We have also worked out during our years of residence a plan of living which may be called cooperative, for the families and individuals who rent the Hull-House apartments have the use of the central kitchen and dining room so far as they care for them; many of them work for hours every week in the studios and shops; the theater and drawing-rooms are available for such social organization as they care to form; the entire group of thirteen buildings is heated and lighted from a central plant. During the years, the common human experiences have gathered about the House; funeral services have been held there, marriages and christenings, and many memories hold us to each other as well as to our neighbors. Each resident, of course, carefully defrays his own expenses, and his relations to his fellow residents are not unlike those of a college professor to his colleagues. The depth and strength of his relation to the neighborhood must depend very largely upon himself and upon the genuine friendships he has been able to make. His relation to the city as a whole comes largely through his identification with those groups who are carrying forward the reforms which a Settlement neighborhood so sadly needs and with which residence has made him familiar.

Life in the Settlement discovers above all what has been called “the extraordinary pliability of human nature,” and it seems impossible to set any bounds to the moral capabilities which might unfold under ideal civic and educational conditions. But in order to obtain these conditions, the Settlement recognizes the need of cooperation, both with the radical and the conservative, and from the very nature of the case the Settlement cannot limit its friends to any one political party or economic school.

The Settlement casts aside none of those things which cultivated men have come to consider reasonable and goodly, but it insists that those belong as well to that great body of people who, because of toilsome and underpaid labor, are unable to procure them for themselves. Added to
this is a profound conviction that the common stock of intellectual enjoyment should not be difficult of access because of the economic position of him who would approach it, that those “best results of civilization” upon which depend the finer and freer aspects of living must be incorporated into our common life and have free mobility through all elements of society if we would have our democracy endure.

The educational activities of a Settlement, as well its philanthropic, civic, and social undertakings, are but differing manifestations of the attempt to socialize democracy, as is the very existence of the Settlement itself.
1.4 The need for a philosophy of education

John Dewey

“Progressive education” is a phrase at least of contrast with an education predominantly static in subject-matter, authoritarian in methods, and mainly passive and receptive from the side of the young. But the philosophy of education must go beyond any method of education that is formed by way of contrast, reaction, and protest, as an attempt to discover what education *is* and how it takes place. Only as identified with schooling does a definition of actual education seem simple, though such definition gives the only criterion for judging and directing the work of schools.

Some suppose that the philosophy of education should tell what education *should* be and set up ideals and norms for it. In a sense this proposition is true, but not in the sense usually implied. For the only way of deciding what education should be, and which does not take us too far away from actual conditions and from tangible processes, is discovery of what actually takes place when education really occurs. Any ideal that is a genuine help in carrying on activity must rest upon a prior knowledge of concrete actual occurrences. A metallurgist’s ideal of the best possible steel must rest upon knowledge of actual ores and of natural processes. Otherwise his ideal is not a directive idea but a fantasy.

So too with the ideal of education as affecting the philosophy of education we have to know how human nature is constituted in the concrete just as the steel-worker has to know about his raw material, to know about the working of actual social forces and about the operations through which basic raw materials are modified into things of greater value. The need for a philosophy of education is thus fundamentally the need for finding out what education really is. We have to take those cases in which we find there is a real development of desirable powers, find out how this development took place, and then project what has taken place as a guide for directing our other efforts. The need for this discovery and this projection is the need for a philosophy of education.

What then is education when we find actual satisfactory specimens of it in existence? Firstly, it is a process of development—of growth, and the *process*, not merely the end result, is important. A truly healthy person is not something fixed and completed. He is one who through his processes and activities will continue to be healthy. He cannot say “I am healthy” and stop at that as if health were bound to continue automatically, otherwise he would soon find himself ill. Similarly, an educated person has the power to go on and get more education, to grow and to expand his development. Hence sometimes learned, erudite persons, as having parted with the capacity to grow, are not educated.

What is growth? What is development? Early philosophers, like Rousseau and his followers, made much use of the analogy of the development of a seed into the full-grown plant, deducing the conclusion that in human beings there are latent capacities which, left to themselves, will ultimately flower and bear fruit. So they framed the notion of a *natural* development, as far as possible left alone, as opposed to a directed growth, direction here being an interference resulting in distortion and corruption of natural powers.
This idea has two fallacies. In the first place seed-growth is limited as compared with human growth; its future is much more prescribed by its antecedent nature; its line of growth is comparatively fixed; it has not the capacities for growth in different directions toward different outcomes characteristic of the human young, which is also, if you please, a seed embodying germinal powers but may develop any of many forms.

This fact suggests the second fallacy. Even the seed of a plant does not grow simply of itself without atmospheric aids. Its development is controlled by external conditions and forces. Native inherent forces must interact with external if there is to be life and development. In brief, development, even with a plant, depends on the kind of interaction between itself and its environment. A stunted oak, or a stalk of maize with few ears of scattered grains, exhibits natural development as truly as the noblest tree or the prize-winning ear of maize. The difference in result is due not only to native stock but also to environment; the finest native stock would come to an untimely end, or give a miserable product, if its own energies could not interact with favourable atmospheric conditions.

There being two factors involved in any interaction (and hence in every kind of growth) the idea and ideal of education must take account of both. Native capacities of growth and inherent traits provide the raw material. What is lacking cannot interact with even the very best of conditions; there is then no leverage, nothing with which to cooperate. Traditional school methods and subject-matter fail in three ways to take this factor into account. In the first place, they ignore the diversity of capacities and needs of different human beings which constitute individuality. They virtually assume that, for purposes of education, all human beings are as much alike as peas in a pod, hence their provision of a uniform curriculum, the same lessons assigned for all, and the same conduct of the recitation.

In the second place, they fail to recognize that the initiative in growth comes from the needs and powers of the pupil. The first step in the interaction for growth comes from the reaching out of the tentacles of the individual, from an effort, at first blind, to procure the materials that his potentialities demand if they are to come into action and find satisfaction. With the body, hunger and power of taking and assimilating food are the first necessities. Without the inner demand and impetus the most nutritious food is offered in vain; repulsion and indigestion result. No proper system of education could tolerate the common assumption, that the mind of the individual is naturally averse to learning, and has to be either browbeaten or coaxed into action. Every mind, even of the youngest, is naturally seeking for those modes of active operation within the limits of its capacities. The problem is to discover what tendencies are especially seeking expression at a particular time and just what materials and methods will serve to evoke and direct a truly educative development.

The practical counterpart of this failure to see the source of initiative lies in the method of imposition by the teacher and of reception by the pupil. The idea of drill is only too suggestive of drilling a hole into a hard and resistant rock by means of repeated monotonous blows. Unwillingness to learn naturally follows failure to take into account tendencies urgent in the existing make-up of an individual. All sorts of external devices then are needed to achieve absorption and retention of imposed subject-matter and skills. This method of teaching may be compared to inscribing records upon a passive phonograph disc to secure their return when the proper button is pressed. Or again the pupil's mind is treated as an empty cistern passively waiting to be filled, while teacher and text-book form the reservoir from which pipelines lead.

The third failure is the result of the two already mentioned. Every teacher must observe that there are real differences among pupils. But, because these are not carried back to concrete differences of individuality in needs, in desires, in direction of native interest, they are too often generalized under two main heads. Some pupils are bright, others dull and stupid! Some are docile and obedient, others unruly and troublesome! Inability to fit into a cast-iron scheme of subject-matter or to meet the requirements of the set discipline is taken as a sign of either radical
intrinsic incapacity or deliberate wilfulness. Conformity then becomes the criterion of judgment in
spite of the value of initiative, originality and independence in life.

While the raw material and the starting-point of growth are found in native capacities, the
environing conditions to be furnished by the educator are the indispensable means of their
development. They are not, and do not of themselves decide, the end. A gardener, a worker of
metals, must observe and pay attention to the properties of his material. If he permits these
properties in their original form to dictate his treatment, he will not get anywhere. If they decide
his end, he will fixate raw materials in their primitive state. Development will be arrested, not
promoted. He must bring to his consideration of his material an idea, an ideal, of possibilities not
realized, which must be in line with the constitution of his plant or ore; it must not do violence to
them; it must be their possibilities. Yet it cannot be extracted from any study of their present form
but from seeing them imaginatively, reflectively, and hence from another source.

Similarly with the educator, save that the demand on him for imaginative insight into possi-
bilities is greater. The gardener and worker in metals may take as their measures results already
achieved with plants and ores, although originality and invention will introduce some variation.
But the true educator while using results already accomplished cannot make them his final and
complete standard. Like the artist he has the problem of creating something that is not the exact
duplicate of some previous creation.

In any case, development and growth involve change and modification in definite directions. A
teacher, under the supposed sanction of the idea of cultivating individuality, may fixate a pupil
more or less at his existing level, confusing respect for individual traits with a catering for their
present estate. Respect for individuality is primarily the intellectual study of the individual to
discover material. With this sympathetic understanding the practical work then begins of modifi-
cation, of changing, of reconstruction continued without end. The change must at least be toward
more effective techniques, greater self-reliance, a more thoughtful and inquiring disposition more
capable of persistent effort in meeting obstacles.

Some would-be progressive schools and teachers in their reaction from the method of external
imposition stop short with the recognition of the importance of giving free scope to native capaci-
ties and interests. They do not examine closely or long enough what these may actually be; they
judge too much from superficial and transitory reactions to accidental circumstances. In the
second place, they are inclined to take the evident individual traits as finalities instead of as
possibilities for suitable direction into something of greater significance. Under the alleged sanc-
tion of not violating freedom and individuality the responsibility for providing development condi-
tions is overlooked. The idea persists that evolution and development are simply matters of
automatic unfolding from within.

This is a natural reaction from the manifest evils of external imposition. But there is a radically
different alternative between thinking of the young as clay to be molded into traditional patterns
and thinking of existing capacities and present interests and desires as laying down the whole
law of development. Existing likes and powers are to be treated as possibilities necessary for any
healthy development. But development involves a point of direction as well as a starting-point
with constant movement in that direction, and the direction-point, as the temporary goal, is
reached only as the starting-point of further reconstruction. The great problem of the educator is
to see intellectually, and to feel deeply, the forces moving in the young as possibilities, as signs
and promises, and to interpret them in the light of what they may become. Nor does the exacting
task end there: it is bound up with the judging and devising of the conditions, the materials, the
tools—physical, moral, and social—which will, once more by interaction with existing powers and
preferences, bring about the desired transformation.

The old education emphasised the necessity for provision of definite subject-matter and activ-
ities, which are necessities for right education. The weakness was that its imagination did not go
beyond provision of a rigid environment of subject-matter drawn from sources remote from any
concrete experiences of the taught. Its conception of techniques was derived from the conventions of the past. The New Education needs more attention, not less, to subject-matter and to progress in technique for getting satisfactory results. More does not, however, mean more in quantity of the same old kind but an imaginative vision, which sees that no prescribed and ready-made scheme can determine the exact subject-matter for the educative growth of each individual, since each sets a new problem and calls for at least a somewhat different emphasis in either subject-matter or angle of presentation. Only blindly obtuse convention supposes that the actual contents of text-books will further the educational development of all children, or of any one child, if they be regarded as the prescription of a doctor to be taken just as they are. As Louis Stevenson remarked, “the world is full of a number of things,” and no teacher can know too much or have too ingenious an imagination in selecting and adapting this and that aspect of some of the many things in the world to meet the requirements that make for growth in this and that individual.

In short, departure from the rigidity of the old curriculum is only the negative side. If we do not go on and go far in the positive direction of providing, through persistent intelligent study and experiment, a body of subject-matter much richer, more varied and flexible, and also more definite in terms of the experience of those being educated, we shall tend to leave an educational vacuum in which anything may happen. The old saying that “nature abhors a vacuum” embodies a definite truth. Complete isolation is impossible in nature. The young live in some environment constantly interacting with what the young bring to it, and the result is the shaping of their interests, minds and characters—either educatively or mis-educatively. If the professed educator abdicates his responsibility for judging and selecting the kind of environment conducive, in his best understanding, to growth, then the young are left at the mercy of all the unorganized and casual forces that inevitably play upon them throughout life. In the educative environment the knowledge, judgment, or experience of the teacher becomes a greater, not a smaller factor. He now operates not as a magistrate set on high and possessed of arbitrary authority but as a friendly co-partner and guide in a common enterprise.

There is a further truism about education as development, difficult to carry out in practice and easily violated. Development is a continuous process and continually signifies consecutiveness of action—the strong point of the traditional education at its best. The subject-matter of the classics and mathematics involved a consecutive and orderly development along definite lines. In the newer education it is comparatively easy to improvise, to try a little of this to-day and something else to-morrow, on the basis of some immediate stimulus but without sufficient regard to its objective or whether or not something more difficult is led up to naturally, raising new questions and calling for acquisition of more adequate technique and for new modes of skill. There is genuine need for taking account of spontaneous interest and activity but, without care and thought, it readily results in a detached multiplicity of isolated brief-lived activities or projects, not in continuity of growth. Indeed, the new educational processes require much more planning ahead by the teachers, for whom the old planning was all effected in advance by the fixed curriculum, etc.

But a sound philosophy of education also requires that the general term environment be specified as dominantly human with its values social. Through its influence each person becomes saturated with the customs, the beliefs, the purposes, skills, hopes and fears, of his own cultural group. The features of even his physical surroundings come to him through the eyes and ears of his community. His geographical, climatical, and atmospherical experiences are clothed with the memories and traditions, the characteristic associations, of his particular society. In the early stages, then, it is particularly important that subject-matter be presented in its human context and setting. Here the school often fails when, in proceeding from the concrete to the abstract, it forgets that to the child only that which has human value and function is concrete. In his nature study and geography, physical things are presented to him from the standpoint of the adult specialist as if independent and complete in themselves. But to the child these things have a meaning only as
they enter into human life. Even those distinctively human products, reading and writing, whose purpose is the furthering of human communication and association, are treated as if they were subjects of and in themselves, not used as is friendly everyday speech, and so for the child they become abstract, a mystery belonging to the school but not to daily life.

The same separation of school studies from social or human setting and function deadens the traditional recitation which, instead of being a scene of friendly intercourse as are the conversations of home and of ordinary life, clarified and organized by definite purpose, becomes an artificial exercise in repeating uniformly the identical material of some one text-book and a mere test of the faithfulness of the preparation. It thus becomes a first cause of the isolation of school from out-of-school life and experience.

As the material of genuine development is that of human contacts and associations, so the end, the value that is the criterion and directing guide of educational work, is social. The acquisition however perfectly of skills is not an end in itself. They are things to be put to use as a contribution to a common and shared life. They are intended, indeed, to make an individual more capable of self-support and of self-respecting independence. But unless this end is placed in the context of services rendered to others, services which they need to the fulfillment also of their lives, skills gained will be put to an egoistic and selfish use as means of a trained shrewdness for personal advantage at the cost of others' claims and opportunities for the good life. Too often, indeed, the schools, through reliance upon the spur of competition and the bestowal of special honours and prizes as for those who excel in a competitive race or even battle, only build up and strengthen the disposition that in after-school life employs special talents and superior skill to outwit others and “get on” personally without respect for their welfare.

And as with skills acquired in school so also with knowledge gained in school. The educational end and the ultimate test of the value of what is learned is its use and application in carrying on and improving the common life of all. The background of the traditional educational system is a class society, and opportunity for instruction in certain subjects, especially literary ones, and in mathematics beyond the rudiments of simple arithmetical subjects was reserved for the well-born and the well-to-do, and thus knowledge of these subjects became a badge of cultural superiority and social status, which marked off those who had it from the vulgar herd and for many persons was a means of self-display. Useful knowledge, on the other hand, was necessary only for those compelled by their class status to work for a living. A class stigma attached to it, and the uselessness of knowledge, save for purely personal culture, was proof of its higher quality.

Even after education in many countries was made universal for all, these standards of value persisted. There is no greater egotism than that of learning when treated simply as a mark of personal distinction to be cherished for its own sake. Yet to eliminate this quality of exclusiveness all conditions of the school environment must tend in actual practice to develop in individuals the realization that knowledge is a trust for the furthering of the well-being of all.

Perhaps the greatest need of and for a philosophy of education to-day is the urgent need that exists for making clear in idea and effective in practice the social character of its end and that the criterion of value of school practices is social.

The aim of education is development of individuals to the utmost of their potentialities. But this statement as such leaves unanswered the question of the measure of the development to be desired and worked for. A society of free individuals in which all, in doing each his own work, contribute to the liberation and enrichment of the lives of others is the only environment for the normal growth to full stature. An environment in which some are limited will always in reaction create conditions that prevent the full development even of those who fancy they enjoy complete freedom for unhindered growth.

There are two outstanding reasons why in existing world conditions a philosophy of education must make the social aim of education the central article in its creed. The world is being rapidly industrialized. Individual groups, tribes and races, once living completely untouched by the eco-
nomic regime of modern capitalistic industry, now find almost every phase of their lives affected by its expansion. The principle of a report of the Geneva Commission based on a study of conditions of life of mine-Natives in South Africa holds good of peoples all over the world, “The investment of Western capital in African industries has made the Native dependent upon the demand of the world markets for the products of his labour and the resources of his continent.” In a world that has so largely engaged in a mad, often brutal, race for material gain by means of ruthless competition the school must make ceaseless and intelligently organized effort to develop above all else the will for cooperation and the spirit which sees in every other individual an equal right to share in the cultural and material fruits of collective human invention, industry, skill and knowledge. The supremacy of this aim in mind and character is necessary, not merely as an offset to the spirit of inhumanity bred by economic competition and exploitation but to prepare the coming generation for an inevitable new and more just and humane society which, unless hearts and minds are prepared by education, is likely to come attended with all the evils of social changes by violence.

The other especially urgent need is connected with the present unprecedented wave of nationalistic sentiment, of racial and national prejudice, of readiness to resort to force of arms. For this spirit to have arisen on such a scale the schools must have somehow failed grievously. Their best excuse is maybe that schools and educators were caught unawares. But that excuse is no longer available. We now know the enemy; it is out in the open. Unless the schools of the world can unite in effort to rebuild the spirit of common understanding, of mutual sympathy and goodwill among all peoples and races, to exorcise the demon of prejudice, isolation and hatred, they themselves are likely to be submerged by the general return to barbarism, the sure outcome of present tendencies if unchecked by the forces which education alone can evoke and fortify.

It is to this great work that any ideal worthy of the name of education summons the educational forces of all countries.
5  Is deliberative democracy enough in teacher education?

Michael W. Apple
University of Wisconsin, Madison

SITUATING EDUCATION

The chapters in this section are wide ranging, thoughtful, and well-written. Each is well worth its own lengthy discussion and the issues that they collectively and individually raise deserve careful consideration. In a relatively brief commentary such as this, I have chosen to focus on one particular set of assumptions and one particular claim that underpin many of the arguments the authors make. I applaud each of the authors for their evident commitment to deliberative processes; but as you will see I have some reservations about its limits and efficacy. But before I make my own arguments about this, I need to situate these arguments in their larger context.

By its very nature the entire schooling process—how it is paid for, what goals it seeks to attain and how these goals will be measured, who has power over it, what textbooks are approved, who has the right to ask and answer these questions, and so on—is political. The educational system will constantly be in the middle of crucial struggles over the meaning of democracy, over definitions of legitimate authority and culture, and over who should benefit the most from government policies and practices. That this is not of simply academic interest is made more than a little visible in the current attempts in many nations to radically transform education policy and practice.

These proposals involve conscious attempts to institute neo-liberal “reforms” in education (such as plans for marketization through voucher and privatization plans), neo-conservative reforms (such as national or state-wide curriculum and national or state-wide testing, a “return” to a “common culture,” and the English only movement in the United States), and policies based on “new managerialism” with its focus on strict accountability and constant assessment. When the efforts of authoritarian populist religious conservatives to install their particular vision of religiosity into state institutions are also added to this mix, this places education at the very core of an entire range of political and cultural conflicts (Apple, 2006).

In teacher education such pressures are increasingly visible in the proposals, among others, to privatize and/or deregulate the education of teachers, in the increasingly common reductive entry and exit tests for prospective teachers, in differential funding to those teacher education institutions whose students score higher, and in the steady growth of home schooling where parents have decided to school their children outside formal educational institutions and to reject the very notion of professionally educated teachers (Apple, 2006; Apple & Buras, 2006).

In many ways there has been a loss of collective memory of the rich history of reflections on the complex role of education in general, and of teacher education in particular, in society. One of the benefits of chapters such as those included in this section—and of the material by Addams, Dewey, Du Bois, and Emerson that accompanies them—is to help
restore the memory of these debates. Indeed, Hansen, Roberson, and Sockett each contribute in very interesting ways to the restorative project by making public the long history of debates and thoughtful positions on what teacher education—and education in general—should do, how this should be decided, and what principles might guide our deliberations.

THE POLITICS OF DELIBERATION

Much of what Hansen, Roberson, and Sockett argue for—and they do so in clear and articulate ways—is grounded in what we would now recognize as a rather Habermasian or Rawlsian position of communicative competence and deliberation in what might be called “ideal speech situations” (see e.g. Habermas, 1984; Crosley & Roberts, 2004; Rawls, 1971), one that has gone beyond Aristotle, Dewey, and others in sophistication. These kinds of positions have much to commend them. And they are important first steps, especially in a time when the arrogance of rightist policies in combination with such things as No Child Left Behind and similar “reforms” have not only denigrated, but have left little time for, deliberation. Many educators and teacher educators face a situation of what might best be called “management by stress.”

However, even with their importance, models based on deliberative democracy—of extending the “public sphere” of debate—are not only too general at times, but unless they are employed with a serious critical economic, political, and cultural understanding, they may ignore the fact that there is a danger of romanticizing the public sphere. As Nancy Fraser (1997) has reminded us, both the public sphere and its accompanying vision of free and open discussions and debate have been grounded in unacknowledged gender relations. And as Charles Mills (1997) has also documented, the theories of liberal democracy that stand behind such visions are based on an unacknowledged racial contract, something Du Bois also understood. Thus, by speaking so generally about public deliberations as their grounding, we may lose the power of speaking equally elegantly and honestly about the specificities of actually existing and very real relations of dominance and subordination—and of the struggles against them—that serve to organize the very structures of the societies in which we live.

This overly general perspective, one that risks romanticizing the public sphere, points to another problem I wish to note. Even with their evident strengths, strengths witnessed in each of the chapters, when we talk about relations of dominance such perspectives have a history of talking about social justice all too vaguely. Hence, they may paradoxically cause us to prepare our teachers less than adequately to deal with the utter complexities associated with concerns surrounding the structures of inequalities in schools and the larger society so well documented for example in the work of Kozol (2005) and Davis (2006). Thus, in our attempts to create critical dispositions in general, we may also risk deskilling current and future teachers. Teachers may understand critical inquiry as a process, but they may not have the knowledge and critical social understanding that might enable them to reposition themselves to see the world through the eyes of those with least in this society. In my mind, it is this act of repositioning that is crucial for a more thorough understanding of social justice and of the role of education and teacher education in the struggles over it (Apple, 1995). A disposition of critical dialogue in general does not necessarily lead to such repositioning.

Yet there is a vital tradition of thinking seriously about what we mean when we want our teachers to be committed both to “thick democracy” and to social justice. This task is appropriately theoretical and political at one and the same time. Once again Fraser is helpful.
Fraser (1997) reminds us that we can (analytically) distinguish two kinds of political movements, a politics of redistribution and a politics of recognition. Neither is a substitute for the other. Both are crucial at this historic moment. Our task is to work on both simultaneously so that gains along one set of dynamics (class and the economy, for example) do not contradict and are not contradicted by the other set of dynamics (struggling for curricula and teaching that respond to oppressed groups’ cultures, identities, and histories, for example, and expanding our concerns about justice, say, to include disability and the politics of the body). Of course, in the real world it is almost impossible to differentiate totally between redistributive movements and those involving recognition. For instance, African Americans and Latino/as suffer economic discrimination and levels of exploitation at a tragic rate and this has predictable effects on educational finance, the realities of schools, and the ways in which education is experienced (see Dance, 2002). But this can more easily occur because of the history of racism and of being constructed as a category of “despised others.” Thus, racism and a retrogressive politics of whiteness cohere with exploitative economic relations.

The implications of Fraser’s points are important for my discussion here. We need to attach our commitment to deliberation to the specific relations of dominance that are so powerful in this society and that are ever present in schools. We need to do so in a way that documents the range of these relations so that our current and future teachers do not engage in actions that have contradictory effects (i.e. that efforts on recognition do not interrupt efforts on redistribution). And we need to do this in such a way that current and future teachers can reposition themselves so that they see what reality looks like if one is subject to the massive inequalities that are so ever-present to millions of people. This can be done by examining the ways in which all too many economic and educational reforms now operate (Apple, 2006; Smith et al., 2004; Valenzuela, 2005; Lipman, 2004). But it also may require that people examine their own lives—their buying habits; where, by whom, and under what conditions their consumer products are made; their hidden feelings about race; the ways they think about who is and is not “deserving”; etc. (Apple, 1996) This process may be uncomfortable, but I believe that it is necessary.

The language of “deliberation” is crucial in establishing a dream of full participation over important issues; but it does not specify in enough detail what these issues actually should be. Nor as I mentioned does it necessarily enable the act of repositioning that I noted earlier was so important. Finally, it does not necessarily lead to action that might interrupt the structural and ideological conditions under which so many of us operate. This does not mean that it can’t. Rather, I fear that under current conditions the tools of deliberation can serve as a limited discursive resource. It will largely be rhetorical, if it is not expressly connected to a larger agenda of social and cultural transformation.

Let me say more about what I mean by this last point. It has become something of a truism in the literature in analytic philosophy that language does and can do many things, all of them valuable. It can be used to describe, explain, control, critique, legitimate, affiliate, and mobilize (Austin, 1962; see also Wittgenstein, 1963). Rhetorical language is associated with legitimation, affiliation, and mobilization; but it is often a poor tool for the other tasks that language must perform. And the tasks of critical educational work are multiple.

THE TASKS OF CRITICAL WORK

In general, there are five tasks in which critical work in education must engage.
It must “bear witness to negativity.” That is, one of its primary functions is to illuminate the ways in which educational policy and practice are connected to the relations of exploitation and domination in the larger society.

In engaging in such critical analyses and understanding, it also must point to contradictions and to spaces of possible action. Thus, its aim is to critically examine current realities with a conceptual/political framework that emphasizes the spaces in which “counter-hegemonic” actions can be or are now going on.

At times, this also requires a redefinition of what counts as “research.” Here I mean acting as “secretaries” to those groups of people and social movements who are now engaged in challenging existing relations of unequal power or in what elsewhere I have called “non-reformist reforms” in education and elsewhere (Apple, 1995).

In the process, critical work has the task of keeping traditions of progressive work alive. In the face of organized attacks on the “collective memories” of difference and struggle, attacks that make it increasingly difficult to retain academic and social legitimacy for multiple critical approaches that have proven so valuable in countering dominant narratives and relations, it is absolutely crucial that these traditions be kept alive, renewed, and when necessary criticized for their conceptual, empirical, historical, and political silences or limitations. This includes not only keeping theoretical, empirical, historical, and political traditions alive—and very importantly, extending and (supportively) criticizing them. But it also involves keeping alive the dreams, utopian visions, and “non-reformist reforms” that are so much a part of them (see, e.g. Jacoby, 2005; Teitelbaum, 1993).

Such work must also assist in the building of critical communities, supporting social movements and mobilizations, engaging with them and learning from them so that we all can go forward. Thus, all of the work of critical education is dependent on having real connections—not simply rhetorical ones—to these social movements and mobilizations (Ayon, 2005; Apple & Buras, 2006). And it is dependent on our willingness to take risks and to not be defensive when those with whom we are working are critical of our efforts.

I note these five tasks because I believe that theories of education, including teacher education, that derive their grounding from theories of deliberation are sufficient for some of these roles. But they are not adequate for all of these tasks. They provide rhetorical resources for pointing to where we might like to go in terms of a general process of debate. In doing so, they enable us to connect to a valued past and act to legitimate that past as well. But they are less than powerful in illuminating the ways in which differential power now operates. They are a bit too utopian in their hopes that all can be or are willing to be equally involved in a “talking cure” for the dilemmas we face as educators. And they are at too general a level to specify the content of what these deliberations must be about if we are to deal with specific economic, political, cultural, and educational relations that condemn identifiable people to lives of misery.

Do not misinterpret me. I support the utopian goal of a society in which all people can and will engage in democratic (and critical) deliberation. But the steps that are required to get there do not automatically arise in a time of anti-democratic sentiment and, especially, in a time when neoliberals are changing our very idea of democracy from more political and collective understandings to a purely economic understanding of democracy as consumer choice (Apple, 2006). Much harder conceptual and political/educational work needs to be done around this, work that recognizes the hidden gendered and raced construction of the public sphere and also develops a sense of how commitments toward
expanding it also can enable the act of repositioning that seems essential to actual challenges to actual inequalities.

Are we starting out anew here in dealing with such issues? Of course not. There are examples of what can be done in teacher education from the continuing efforts of Kenneth Zeichner and Marilyn Cochran Smith (see Liston & Zeichner, 1991; Zeichner & Liston, 1996; Cochran-Smith, 2004) to the ongoing attempts at building and defending critically and ethically responsive models of teacher education in institutions throughout the United States (see, e.g. McDonald, in press), to so many others. And these examples can be linked concretely to much more critically democratic educational practices in real schools in real communities throughout the world, from the United States (Apple & Beane, 2007) to places such as Brazil (Apple et al., 2003).

In my mind, the experiences of Porto Alegre are essential here. Critical educators at schools and universities, government officials, and community activists, have taken up a model of critical deliberation and dialogue based on some of the work of Paulo Freire. They have recast it to make it more inclusive of multiple dynamics of power (both redistribution and recognition) and have made it more sensitive to the realities of the conditions of the poor and disenfranchised. The results are striking, both in terms of the kinds of deliberation that go on and in terms of the content of these deliberations—and especially in terms of the concrete interruptive actions that are the results of this ongoing process. I urge all of us to pay close attention to what is happening there. This example may provide us with a model of critical deliberation that has more bite than those with which we are used to dealing. Furthermore, the international focus would be salutary, since it would enable our teachers and others to understand that we may have much to learn from places outside our borders. In both of these ways, then, our deliberations may run less of a risk of being “free-floating” and may actually be much more adequately connected to a series of well thought out and active interruptions of dominance in educational and social policies and practices.

There are of course dangers in what I have proposed here and in the arguments I have made. The debate over indoctrination that played a key role in the history of education in the United States comes to mind. And I am certain that not everyone will agree with the points I have made here. However, it is to the credit of the chapters by Hansen, Roberson, and Sockett included in this section that they have opened the space for these considerations and debates. Let the debates continue.

6 Advancing the public purpose of schooling and teacher education

John I. Goodlad
University of Washington

The people of this nation have extraordinary expectations for those who teach the young in schools and very diverse views on the preparation necessary for their work. As David Hansen points out in his opening chapter of this handbook, there are those who believe that teachers need no formal, professional preparation. But what he and his colleagues perceive to be the purposes of teacher education calls for immersing future practitioners in educational agendas that one would be hard-pressed to find in our colleges and universities.

Studying the history of professions reveals that all have intensely debated the purposes of educating practitioners. Those put forward for medical education in Abraham Flexner’s groundbreaking report of 1910 fueled heated debate for several decades over issues that remain central today in making curricular and other decisions. The issue of gaining the right balance of general education, scientific studies, and clinical apprenticeship remains at the forefront of debate, as Flexner predicted.

One of the most interesting agreements about the purposes of teacher education put forward by Hansen, Emily Robertson, and Hugh Sockett is the interface between their comprehensive high-level take on the topic and thoughtful consideration of what preparation teachers would need if serious attention were given to meeting the public’s expectations for our schools. From our respective studies of schooling conducted in the early 1980s, Ernest Boyer and I concluded, quite independently with respect to each other’s ongoing work, that “we want it all”: the personal, social, vocational, and intellectual development of the child (1983, 1984). Surely we can assume that what we want our schools to do is what we want teachers to be able to do.

THE PURPOSES OF SCHOOLING

As with most social science research, particularly surveys, one must take great care in interpreting findings and conclusions. Many surveys of public expectations for schooling either leave respondents free to state their preferences or to choose among the alternatives provided for them. The dominant response over a long period of years has given preference to the academic—that is, the teaching of departmentalized subject matter and basic skills of reading, writing, figuring, etc. But this finding should not be interpreted to mean that respondents reject other categories of learning. Indeed, most would oppose the neglect of students’ personal, social, and vocational development. In our study of 8,624 parents, 1,350 teachers, and many thousands of students, colleagues and I called for their rating of all of these. The only category not rated “very important” by every group was the vocational, which elementary school teachers considered to be only “somewhat important” (Goodlad, 1984).
Parents and teachers of our sample rated “personal development” as a goal for schools only a little behind “intellectual development.” Large percentages of all three groups of respondents would opt for more attention to the personal, especially in those schools viewed by their clientele as providing well for students’ intellectual development. These findings do not surprise me.

Most parents perceive schools to be responsible for educating what was once commonly referred to as “the whole child.” The concept fell into disfavor in the 1950s when the attack on anything considered to be “Progressive Education” was in high gear. The term is once more gaining legitimacy today as we appear to be moving out of a longstanding cycle of “hard-and-tough” expectations for schooling into the more “soft-and-tender.”

Jane Roland Martin (1992) and Nel Noddings (2003), among others, have had the splendid audacity to propose for schools the cultivation of happiness in the young. Since schools have played a major role in the creation of childhood as a distinctive phase in the life cycle, it is past time for us to ensure that parents support and teachers provide educational environments that truly implement the common rhetoric of school reform: “It’s all for the children.”

Having written the above, I already begin to feel uneasy. I have been around this fingerpost of the domain of schooling before—several times. One finger points to “Children’s Interests,” another to “Academic Rigor,” another to “Responsible Adulthood,” and still another to “Economic Productivity.” Because the fingers are at right angles to one another, the more one moves in the direction to which each points, the further one gets from the paths that reach out from the other fingers. And the less attention is given to the existence of these other paths.

Several decades ago, I was approached by an enthusiastic group of teachers who sought my support for “the open classroom.” They were correct in assuming that some of my educational views were compatible with some of those guiding their interpretation of this innovation. But we were not long into our conversation before I realized that they advocated a curriculum that would emerge entirely out of children’s interests. This and several of their other views would put them on a collision course with all those people who follow other paths, particularly the one to which the finger labeled “Academic” points. The more these teachers followed exclusively the finger pointing to the “Children’s Interests,” the more they would fuel the nonproductive debate and struggle over the soul of the American public school. I declined their invitation. My mother’s voice has come back to me again and again to guide me in matters carried to indefensible extremes: “Practice moderation in all things.” I do not want to be perceived as dedicated to only one path of educational preference.

Currently, the No Child Left Behind (NCLB) Act is directing schools to follow a narrow academic path that ignores the fingerpost of the comprehensive mission for schooling consistently endorsed by a very large majority of the American people. The major danger is not that hundreds of thousands of children and youths are being denied the breadth and depth of education they need for making the most of themselves in this complex world, serious though this danger is. The even greater danger is that, should NCLB or similar successor mandates prevail through the next decade, our educational system will fail in its major purpose—that is, to provide for all the comprehensive education that ensures a democratic public (Barber, 1997).
THE PURPOSES OF TEACHER EDUCATION

Productively helping the young to gain some fundamental understanding of concepts such as time, space, light, gravity, and the tides; appreciation of the arts; the structure of our federal government; and why there are night and day and summer and winter is pedagogically challenging. It requires of each teacher of the physical sciences, the arts, the humanities, and the social sciences a deeper understanding of the subject matter than is expected of the students. But it also requires a repertoire of teaching skills and sensitivities grounded in knowledge of cognition and honed in practice: pedagogy, the art and science of teaching.

That teachers of both elementary and secondary school classes should be quite well versed in the subject matter they teach and the methods of teaching they will use is a longstanding assumption of the public, those who teach persons aspiring to teach, and those who establish the entry requirements. All groups also agree that teachers should have some understanding of the role schooling has played in our society, the social and economic values that have influenced educational policies and school curricula, and the developmental characteristics of the young. As a consequence of this interface, the educational requirements each state sets for certification to teach are rather closely matched by the preparation programs of colleges and universities.

Were it not for the fact that teachers of elementary school classrooms usually teach all the subjects of the curriculum (with those of the larger schools commonly relieved of the arts and physical education, if such are provided at all), much of the intense debate over the professional education of teachers would never have arisen. Given this daunting requirement, it is understandable that college faculty members responsible for preparing elementary school teachers would insist on teachers at this level gaining some educational background and pedagogical competence in all the relevant fields.

Understandable though this position is, it has spawned a host of problems: near impossibility of future elementary school teachers’ completing both college graduation and teacher certification requirements in the normal time of 120 semester or 180 quarter hours, course overloads, reduction of education in the arts and sciences, and severe criticism of schools of education. Pundit George Will has been erroneously reporting for decades that most future teachers are majoring in a field of education devoid of intellectual content. A large segment of the public now believes this to be true.

We found in our study of a representative sample of colleges and universities that the undergraduate curriculum of teacher education in professional studies was very much like that of other fields such as business, journalism, and engineering in sharing their time with the arts and sciences. A dean of the arts and sciences in a major university we visited was highly critical of its school of education’s usurping too much of the undergraduate curriculum. He held up the journalism program as having the ideal distribution. I found that it required more courses in the vocational field than did the secondary teacher education program and came close to meeting that of elementary preparation.

There is a myth about the course demands of college and university teacher education that just does not go away. Unfortunately, it is kept alive in part by the existence of some programs that come close to replicating the critical stereotype. We found no programs where general and special subject courses took up less than half of the four-year curriculum. But we did find a couple where getting two years of general education and completing the teacher preparation requirements required crowded programs of well over 120 semester or 180 quarter hours of credit—situations much in need of substantial improvement. Interestingly, the deans of education of universities in the same states...
were very much aware of these programs, regarded then as institutional cash cows, and thought it was high time for them to be revised or discontinued.

I realize that most readers of this handbook are well aware of the realities described and perhaps are wondering why I am giving them so much attention in a short commentary. My reasons pertain to the gulf between the purposes of teacher education put forward by Hansen, Robertson, and Sockett and those embedded in the long-term struggle over the preparation teachers need for fulfilling much more modest expectations. The gulf between what some of our most thoughtful educators have proposed for both schooling and teacher education over the past half-century and what James B. Conant recommended nearly fifty years ago (Conant, 1959 and 1963) and a host of federal and state commissions have recommended is substantial. Consequently, there must be an ethos of policy and public support, or what is so gratifying to read in the section of this handbook on the purposes of teacher education will become just one more script for educational theater.

ON IMPLEMENTATION AND RENEWAL

Twenty-nine editorials written by Marilyn Cochran-Smith during the six years she was editor of the Journal of Teacher Education are available in a single volume (2006). She refers frequently to the necessity of educators’ being much more involved in the determination of educational policy and practice. I have referred from time to time to a cautionary stance of some educators that comes close to giving up rights of citizenship. School teachers and administrators and teacher educators should be educational leaders in their communities. They not only should be communicating with the public regarding what they are doing and why but also about needed improvements based on trial and solid inquiry.

Good ideas come and go, sometimes are resurrected and then fade, perhaps after they have had brief flowering in a few boutique gardens. David Tyack and Larry Cuban describe some of this in their historical analysis of schooling in the twentieth century, aptly titled Tinkering Toward Utopia (1995). They offer no blueprints for change but do conclude that improvement would be more likely to occur if more power were shifted to the local level and if there were closer linkages of schools and their communities. I agree.

Most readers of this handbook will resonate with the rich array of purposes for teacher education that Hansen, Robertson, and Sockett have set before us. Their menu encompasses and enriches the personal, social, vocational, and intellectual domains described by that large sample of people polled over the last several decades. But the devil is in the details.

Hansen writes: “If a ‘purpose’ is understood as something anticipated or envisaged that is to be brought about through human agency and creativity, then it remains legitimate, coherent, and necessary to speak of the purposes rather than merely the functions of teacher education.” Sockett writes that “the moral and epistemic purposes of teacher education are . . . critical not only in enhancing the quality of practitioners in teaching, but also in contributing to the development of the public status of the occupation of teaching,” and then goes on to quote Sullivan (2004): “Professionals are inescapably moral agents whose work depends upon public trust for its success.” I agree.

On assuming the above paragraph presents logical truth, educators had better not also assume this to be truth widely shared. “Moral” is a word of many interpretations. One might expect the high public expectation for personal development of the young in
schools to include moral denotations and connotations, but some of the advocates of this school purpose view it as excluding any teaching of moral values.

Hugh Sockett was a member of a group of educators who wrote a book entitled *The Moral Dimensions of Teaching* (Goodlad *et al.* eds., 1990). If his subsequent experiences were anything like mine, he would have quickly encountered both puzzled and negative reactions even to the title. Following a speech I made on the topic, a man in a rather selective, university-based audience expressed pleasure over educators becoming concerned at long last about sins such as drinking, taking drugs, and sexual activity not condoned by marriage. Readers in Moscow, just as the U.S.S.R. was breaking up, and in Buenos Aires, however, viewed the book as contributing to the very essence of democracy—how we should behave with one another as members of humankind.

In another chapter of that book, Sirotnik (1990) describes the American democracy as “a moral community that transcends the special interests of individuals, families, groups, that stand for what this country is all about: liberty and *justice* for all . . . It is a ‘moral ecology’ held together by a political democracy and the fundamental values embedded in the system” (p. 307). He then poses the question “What could be more central to education generally and public schooling particularly than moral commitments to inquiry, knowledge, competence, caring, and social justice?” (p. 308). Sirotnik put forward a public democratic purpose for schooling. But a significant segment of the public harbors a private purpose: both democracy and the public school are to take care of their needs, wants, and individual (rather than collective) goals. World historian Alan Wood notes that we cherish freedom as the essence of the American democracy but have given too little attention to our responsibilities for its care (2001).

What Emily Robertson sees as central to the care of our democracy is widespread practice of democratic participation. The knowledge, competence, and inquiry required presumably are what Sirotnik viewed as central to education generally and public schooling particularly. But Robertson makes it clear that these attributes are learned through disciplined participation, whether as students in schools or adults in the daily life of communities. They are not “delivered” by teachers and teacher educators. Indeed, educators must learn them through the participatory route of all other members of a democratic public. And educators are likely to have just as much difficulty as others will have in debating issues grounded in moral values.

Hansen, Robertson, and Sockett do a magnificent job of presenting the case for purposes of teacher education that take us far beyond the traditional scope of the enterprise, a scope dominated by issues of what academic content to teach and how to teach it. Implemented in practice, these purposes would shift the public status of teaching from a minor to a major profession.

But even the implementation of the traditional purpose was fraught with controversy. Robertson cautions us: “The debates about educating democratic citizens, and the knowledge and commitments their teachers should have, seem as polarized as the rest of the political landscape . . . Democratic education of students and its implications for teacher education are contested terrains.” And embedded in these contested terrains also are the comprehensive scope of the intellectual purpose put forward by Hansen and, most certainly, the moral and epistemic purposes elaborated by Sockett. It is essential to remember how very public schooling is, without backing off from advancing the education of the public the care our democracy requires (Goodlad *et al.* 2004).

It becomes obvious that teacher educators must play an active role in addressing the challenge of significantly broadening the purposes of this critically important educational endeavor. A major component of this challenge is that of engaging the public—not just a few of its leaders—in sustained discourse followed by action regarding the purposes and
conduct of public education and schooling. Clearly, the Founding Fathers did not intend for the nation’s capital to be the epicenter of educational debates and policy making. History has shown us but not as yet taught us how wise they were.

A thought from another world
The professional education of Black teachers in Georgia, 1930–1965

Vanessa Siddle Walker
Emory University

Three assumptions undergird the excellent essays on teacher education presented in this section of the handbook. The first suggests that constructing and transmitting knowledge for teachers is primarily a conversation for teacher educators in academic institutions. This assumption emerges despite Hansen’s admonition that teacher education should be ongoing, both formal and informal. The second assumption implies that historical ideas and theorists, rather than historical actors and practices, provide the most salient context for contemporary conversations. Amplified by the artifacts presented, this assumption is threaded throughout and reinforced through recurring portraits of teacher educators such as John Dewey. Finally, the essays decontextualize the diversity of teacher educators, teachers, and local contexts and assume the general purposes of teacher education are broadly applicable across these contexts. Although Dewey’s artifact reminds readers that, for purposes of education, we too often assume that “all human beings are as much alike as peas in a pod,” the essays fail to problematize differences in ethnicity, historical period, and region. This occurs despite the important attention given to a social justice agenda.

This commentary proposes to extend the conversation on teacher education by providing an alternative world view on the assumptions identified, specifically utilizing the lens of Black teachers in Georgia during a historical period of de jure segregation (Walker, in press). The utilization of a Black teacher sample to contribute to a professional conversation about teaching remains an embryonic idea. The more frequent depiction of Black teachers and teaching is embedded in the W. E. B. Du Bois artifact, which recounts the story of low pay, poor teaching circumstances, and oppression by White superintendents that permeated the world of John and other Black teachers of his era. However, as poignant and accurate as is John’s story, the professional activity of Black teachers in the decades following John’s escape reveals the narrowness of the historical lens that has reduced the story of Black teachers primarily to one of inequality. To fail to include the professional activity of Black teachers in constructing an understanding of the aims of teacher education is to ignore, as Ralph Waldo Emerson notes, “the mind of the past.” Or, as Du Bois eloquently describes the disconnect between Black and White Georgians: “And neither world thought the other world’s thought.”

To elevate the Black teaching profession during segregation into a contemporary conversation on teacher education requires some contextualization. For example, many Black teachers during this period, despite the devaluing of teachers generally, and Black teachers especially, referred to themselves as “professionals” and embraced practices that incorporate much of Sackett’s description of a professional group. That is, they maintained a code of professional practices, sought the elevation of the profession through attempts to raise teacher standards and increase financial rewards, and existed in local settings where Black principals could, and sometimes did, apply sanctions to
teachers who did not abide by the commonly-accepted teaching code. This degree of self-governance was possible as a result of the isolation imposed by White superintendents who often ignored the activity of Black teachers unless behaviors were exhibited that challenged the status quo (and these activist behaviors were generally carefully concealed). However, the result was a world in which Black educators were often able to function with a semblance of the autonomy Robertson values.

Three characterizations of the professional education and activities of Black teachers are useful to extend the current dialogue. These are: (1) that the education of teachers and the discussion of the purposes of education were broader than teacher education institutions, (2) that practices in teacher education were not disconnected from the larger academic world of teacher educator personalities and ideas, and (3) that social justice and curricular focus existed as a merged agenda, rather than a separately codified explanation of options. These characterizations are drawn largely from the archival records of the Black teachers association in Georgia and are discussed in more detail in Walker (2005) and my forthcoming work, *Hello Professor: The Professional Development World of the Black Principal Leader*.

**PROPOSITION ONE: THE EDUCATION OF TEACHERS WAS BROADER THAN TEACHER EDUCATION INSTITUTIONS**

Black teachers during the 1930s and 1940s were faced with the Herculean task of improving the educational knowledge base and certification level of their peers, many of whom held earlier state certifications that did not require a college degree. Black teacher education institutions in the South played the dominant role in this initial certification process. Although the teacher education activities of these institutions beg additional research, ads from the quarterly publication of Black teachers, the *Herald*, provide data demonstrating the ongoing commitment of these institutions to providing continuing coursework to expand the disciplinary training of teachers. Additionally, articles reveal the ways Black colleges sought to prepare teachers who would be sensitive to the particular needs within the state, the ways they worked cooperatively to develop a state vision for Black teacher education, and the type of professional conversations they had, such as appropriate evaluative criteria for prospective teachers (e.g. “Georgia’s New Education Program,” p. 8; Bolden, 1963, p. 6). The role played by these institutions in developing teachers was considered to be so substantial that educators during the era argued that “The Negro College in the south can potentially in no other way at this time contribute so much to the race and to society as by devoting its best efforts to the development of a superior profession of teachers . . .” (“What Every Teacher Should Know,” 1941, pp. 12–13).

Ironically, however, despite the visibility of the teacher education institution in disseminating and structuring the aims of education, oral historical accounts by Black educators in Georgia seldom attribute their professional beliefs to the teacher education curriculum in these undergraduate institutions. Rather, the professional association of Black teachers, the Georgia Teachers and Education Association (GTEA), appears to have played the more substantial educative role over time. In the professional meetings designed in corporation with this structure, Black educators report that they were revitalized professionally, able to experiment with their own ideas, and inspired to learn from the practices of colleagues who were working under similar restricted conditions. Opportunities for professional education that existed through GTEA included teacher study groups, organized across the state with the direct purpose being to “raise the
standards of work of the teachers” (“Georgia Jeanes Supervisors,” 1937, pp. 9–10). They likewise included district and state meetings, where yearly and quarterly programs consistently included ongoing dialogue and sharing of professional practices among participants. The tenor of many of these meetings is captured in the minutes of a 1941 district meeting: “The groups entered into a thorough discussion of their problems—how the school is meeting the mental, physical, and moral needs of the child . . . The meeting was outstanding for the spontaneity of group participation and enthusiasm (“What the Districts are Doing,” 1941, p. 17).

Purist historians will cringe at the imposition of a presentivist framework on an historical practice; however, the professional programming of Black teachers across the state correlate in significant ways with “deliberative democracy” that Robertson argues is essential if teachers are to model discussion capacity with their students. Importantly, the activity also demonstrates the ways in which institutional structures joined in teacher education. Importantly, this focus included teacher education departments, but the talk was not confined to academics in departments of teacher education.

PROPOSITION TWO: THAT PRACTICES IN TEACHER EDUCATION IN THE FIELD WERE CONNECTED TO TEACHER EDUCATOR PERSONALITIES AND IDEAS

Sockett bemoans the disconnectedness between practitioners and academics that characterizes the current teacher education climate. However, similar to the University of Chicago professors who are reported to have frequented the Hull-House on Sunday evenings, Black teachers of Georgia lived in a world closely connected to the leading educational thought of their day. For example, in a speech at the GTEA convention in 1937, and later reprinted in their professional journal and distributed throughout the state, Du Bois embraces Hansen’s first purpose of teacher education, to esteem the value of academic subjects (“Curriculum Revision, 1937, p. 15). Du Bois argues that the foundation of ‘an intelligent citizenship’ was based on teaching students to read, to write, and to use numbers” (pp. 13–17). Indeed, he rails that “the school has but one way to cure the ills of society and that is by making men intelligent.” Du Bois’s connection to Black Georgia teachers, though unchartered in his biographies, is unsurprising in light of his service as a member of the advisory board of their association in 1937.

Yet, having a scholar of the reputation of Du Bois participate in their professional educative circle was not a unique occurrence. In the 1940s, Horace Mann Bond edited the teachers’ journal while he served as president of Fort Valley State. Although Bond’s biographers note that he did little scholarly writing during this period, his articles in the journal demonstrate the ways in which he exploited his position as “editor” to provide detailed information to Black teachers on the educational terrain inside and outside of Georgia. Teacher Educator William Kilpatrick, a Georgia native, also appears in their journal and at their professional meetings, as do other prominent educators such as Allison Davis and Charles Thompson.

A point about the intersection of Dewey with Black educators is also important, given the prominence of Dewey in the current conversation. In ways uncaptured in most descriptions of his work, Dewey figures prominently in the professional talk of Black educators in Georgia. Black teachers of the era adopted Dewey’s beliefs about schools, and myriad references occur to life teaching, community study, and knowing the needs of the child exist in their district, state, and local talk. (e.g. “Reports from Department
Meetings,” 1938, p. 11; “Conference of Principals of Negro High Schools,” 1940, pp. 8–9; “Programs of District Teachers Meetings Held,” 1941, p. 19). Even the language that has been captured in oral history accounts detailing the professional vision of Black educators on the education of Black children is reflective of their familiarity with Dewey’s philosophy: the child is to progress from the known to the unknown; the teacher can’t teach a child he/she doesn’t know; every child must be given the opportunity to reach his highest potential. Reinforced by a new Georgia state curriculum, Black teachers built a professional view of teaching that heavily incorporated Dewey’s ideas and extended throughout the decades of Black segregated education.

In sum, the Black historical actors of this period did not exist estranged in a segregated world; rather, many lived in a close professional world with leading theorists. They were not all intimately acquainted with each person; however, the mechanisms of professional training in which they participated cultivated a knowledge base of ideas that became part of their general ideology of teaching. In this history, the disconnect between practitioners and academics does not appear to be so broad a divide.

PROPOSITION THREE: THAT SOCIAL JUSTICE AND CURRICULAR FOCUS EXISTED AS A MERGED AGENDA

Throughout its history, GTEA used its leadership structure to focus on improving teaching conditions, even as it structured and supported the ongoing professional talk described above. Du Bois’s speech, noted earlier, captures the duality Black teachers confronted. Although Du Bois admonished teachers to hold high curricular standards, he also stressed that teachers should also be concerned about lengthening the school term, making attendance mandatory, and selecting teachers (p. 17). For Black teachers, the teaching act could not be separated from the teaching environment. In this compilation of academic standards and social justice that characterized the talk of their era, Black teachers provide an example of Hansen’s wondering of what it would mean to put “educational processes in the service of overtly political objectives” (p. 12).

One way in which this practice is most repeatedly observed is in the Black teachers’ application of Dewey and their co-opting of his use of democratic aims of education. In the artifact in this section, Dewey critiques racial and national prejudice, noting that schools must “rebuild the spirit of common understanding, or mutual sympathy and goodwill among all people and races to exercise the demon of prejudice.” Black educators took Dewey at his word.

Despite the segregated circumstances in which they lived, Black teachers widely embraced teaching Black children to participate in a democratic society. The focus on democratic living embraced by Black teachers was part of a social studies curriculum, as Patrice Grimes has documented in a doctoral dissertation on their teaching activities during this era (Grimes, 2005). However, their focus on democratic living was broader than a particular disciplinary initiative. Theirs was the embodiment of Dewey’s challenge to prepare a new generation for a “new and more just and humane society.” This belief is woven throughout their professional talk. Moreover, the ways in which students verbally embraced these ideas is exemplified in a speech given on Citizenship Day in 1939. The recent graduate notes that

... things will not always be the same. Perhaps not in our day will any great changes come about. But the time will surely come when no one, regardless of race, creed or color, will be denied his full constitutional rights and privilege. Then we, as citizens,
can feel that we played a definite part—although we were but a small cog in the wheel—in the fight to bring about freedom for all.

(Irby, 1940, p. 6)

In sum, Black teachers used their teaching to prepare children for a world that did not yet exist. This social justice agenda was mediated by the cultural and social needs of their children and not subordinated to a curricular discussion. Rather, curricular focus and social justice existed co-dependently.

This overview of the practices of Black teachers is not posited to suggest that the practices of Black teachers were unique. White teachers of the era also engaged in professional training through their teaching association. However, White teachers of the era do not embrace social justice in the same manner, a point that is significant in considering the ways in which region and culture influence the aims of education. Of certainty, the ideas are also not posed to suggest direct correlations with contemporary ideas. Sockett makes an important point exemplifying this difference when he notes that ideas such as in loco parentis (which Black teachers uniformly embraced) have been replaced in contemporary climates with due process.

However, the inclusion of the historical Black teaching world in a conversation on teacher education unmasks how culture and local circumstances might transform political ideas. It may move us beyond the assumption that teacher education institutions must singularly dispense professional ideas and generate an impetus to forge collaborative educative relationships with other stakeholders. We might also be reminded that social justice and academic excellence do not have to live disconnected—and, for that matter, neither do teacher educator professors and classroom teachers. Perhaps another world could provide context that will prompt a new thought.

What should teachers know?
Teacher capacities: knowledge, beliefs, skills, and commitments

*Editor: Carl A. Grant*
Part 2
Framing chapters
Initially many of us associate the word “capacity” with the natural sciences—with units of measure such as pints, quarts, teaspoons and liters. Having earned an undergraduate degree in science, I initially learned about capacity with the experiments I conducted in my physics classes. Over the past few decades, however, capacity has increasingly become a concept in social science scholarship, including research in education. Conduct a Google search for “teacher capacity,” and the results reveal thousands of documents using this term in many different ways. In this chapter, we define teacher capacity as a teacher’s knowledge, skills and dispositions.

HISTORICAL INFLUENCES ON THE DEFINITION OF TEACHER CAPACITY IN THE UNITED STATES

Debates about what makes a good teacher and what capacities teachers need to be good teachers have flourished both inside educational institutions and in the greater society for decades. McDiarmid and Clevenger-Bright (this volume, Chapter 9), for instance, tell us that as early as 1830, at Barre Normal School in Massachusetts, Governor Everett identified four core areas of study for teachers. Then, as now, the focus was on teacher knowledge, skills and dispositions.

However, as time and context change, as events with wide-ranging consequences occur, and as developments in science lead to technological advancements, society and government have made demands for standards and accountability that require teachers not only to keep pace with the change, but to lead the change. This, in turn, has required the definitions of teacher capacity to be altered and amended. For example, in order for students to meet curriculum/performance standards and for schools to meet accountability requirements, teachers’ knowledge has had to become deeper and more flexible. This now includes having an understanding of the relationship between content knowledge and pedagogical content knowledge. Teacher capacity must also include such essential skills such as having a wide array of grouping strategies and assessments techniques. In addition, teachers must have dispositions that foster positive attitudes toward change as well as a commitment to student learning. They must also be committed to the paramount perspective that all students can learn.

Three examples from recent history

Three examples illustrate how our concept of what constitutes acceptable teacher capacity has changed during the course of the twentieth century. The first example comes from the early 1900s when scientific management and educational efficiency based upon
business and industrial values and practices arose in response to the nation’s rapid industrialization and urbanization. These influenced definitions of teacher capability. The second example is from the middle of the century, after the Soviet Union launched the Sputnik satellite into orbit in 1957. The third example is from the latter part of the century, after the 1983 publication of the National Commission on Excellence in Education’s report, *A Nation at Risk.*

Agriculture increasingly gave way to manufacturing in the late 1800s and early 1900s in the United States. Industrialization led to urbanization, as many Americans—black and white—moved into cities. Additionally, the early 1900s saw numerous miraculous technological achievements such as the Wright brothers’ first controlled, powered, heavier-than-air human flight in 1903; the construction of skyscrapers such as the Cass Gilbert-designed Woolworth Building, which opened in New York City in 1913; the opening of the Panama Canal in 1914; and Henry Ford’s development of the assembly line which led to mass production of automobiles. All of these greatly increased America’s international trade activity (Nash et al., 1990; Yapp, 2000).

Industrialization, urbanization, and international trade influenced the questions being asked and debated with regard to teacher knowledge, skills and dispositions. This was especially true after a new concept about industrial management, known as “scientific management” or the “Taylor System,” emerged from hearings before the Interstate Commerce Commission in Washington, D.C. in 1910, which dazzled American society (Callahan, 1962, p. 19).

In 1913, Franklin Bobbitt addressed the application of scientific management to education in the Twelfth *Yearbook of the National Society for the Study of Education* titled, *Supervision of City Schools.* Although scientific management was forwarded as an idea to be employed by school superintendents and principals, it also had implications for teacher capacity. Bobbitt argued that an educator’s knowledge “must be kept up to standard qualifications for his kind of work for his entire service” (cited in Callahan, 1962, p. 89). He also insisted that school systems had the right to tell teacher training institutions what their specifications for teachers were, saying, “They have the same right to say to colleges what products shall be sent to them as a transportation system has to say to a steel plant what kind of rails shall be sent to it” (cited in Callahan, 1962, p. 89).

In 1957, when the Soviet Union launched the space satellite, “Sputnik,” politicians and pundits severely criticized the curriculum of the education system in the United States. Critics claimed that the science and technology instruction offered in public schools was vastly inferior to that offered to students in the Soviet Union. Conant (1963), for example, claimed that educational requirements were too low; Koerner (1963) argued that there was “inferior intellectual quality of the education faculty” (p. 73); and Rickover (1959) contended that the neglect of science and mathematics in the schools had weakened the American capacity to survive in a dangerous world. Along related lines, Bestor (1955) claimed that teachers needed increased understanding of the separate disciplines. He described social studies as “social stew” and argued that teachers should have a knowledge base in history, geography, and political science. The social policies adopted in the late 1950s were in part a response to the perceived Soviet lead in science and technology; these required that teachers’ knowledge and skills reflect a high level of understanding of science and mathematics. This was done with the intention of helping the United States regain global eminence in science and technology through teachers’ excellence in teaching.

In 1983, the publication of the National Commission on Excellence in Education (1983) report, *A Nation at Risk,* again raised the debate about teacher capacity. The report called attention to the dismal failure of public schools in the U.S. in comparison
with the educational systems in other countries. A much-quoted line from the report captures the harshness of the criticism toward American public education: “If an unfriendly foreign power had attempted to impose on America the mediocre educational performance that exists today, we might well have viewed it as an act of war” (p. 5).

A Nation at Risk called for major reforms in teacher preparation, with particular attention to the knowledge, skills, and dispositions that enabled teachers to teach higher-level thinking in the areas of mathematics and science. Two other influential reports followed A Nation at Risk: Teachers for Tomorrow’s Schools from the Holmes Group (1986) and A Nation Prepared: Teachers for the 21st Century from the Carnegie Corporation (Carnegie Forum on Education and the Economy, 1986). Both reports argued that teachers’ capacity should be grounded in the humanities and sciences, and both recommended the elimination of undergraduate teacher education programs, instead suggesting that teacher education be a post-baccalaureate program and that teacher candidates hold a bachelor’s degree in an academic discipline in addition to a degree in education.

What we see from these three examples is that debates about what teachers need to know, including their skills and dispositions, change and evolve in response to changing social, economic, and political agendas. However, these examples also make clear that while attention to mathematics, science, and technology is often at the forefront in discussions about what teachers need to know, attention to issues of diversity have for the most part been marginalized or omitted from the discourse.

The approach to teacher capacity we took in this section

This section of the handbook could have been conceptualized in many ways. However, as section editor and chapter authors, what we saw missing or lacking in much of the literature on teacher capacity was scholarship about teacher capacity as it relates to knowledge, skills, and dispositions for teaching non-white students and other traditionally marginalized groups. Also, what we saw that needed attention and direction were discussions that explore the multiple relationships and discourses between teachers’ knowledge, skills, and dispositions and social justice, as well as what teacher candidates need to know, care about, and be able to do to work in classrooms that are becoming increasingly diverse. Additionally, we noticed that a good deal of the literature on teacher capacity lacks new insights, is too selective, or is limited in its discussion of historical ideas and events that would help teacher candidates to better understand teacher capacity today.

As editor of this section, I am not suggesting that there is no scholarship that seeks to show a relationship between social justice and teachers’ knowledge or that seeks to inform teacher candidates about the knowledge, skills, and dispositions they need to teach socially and racially diverse groups of students. There is scholarship along these lines, and the chapters in this section have richly benefited from it. However, much of this scholarship points out that the work examining the relationship between social justice and teacher capacity is limited, and that questions about what teachers need to know, care about, and be able to do need more in-depth study.

In response to these gaps in the education literature, we decided to develop and organize this section of the handbook so that it addresses diversity within the teacher capacity discourse. Having decided upon the approach, we next discussed the purpose and goal for each of the three chapters, including artifacts that would enrich and inform the discussion, and who would write commentaries that would “trouble” the teacher capacity discourse, and even our arguments in the chapters. The chapter authors first wanted
to provide readers with a history of teacher capacity so readers could understand how, why and to what end teachers’ knowledge, skills and dispositions have been conceptualized in the earlier years of the country. Second, the authors wanted to call attention to the many recent changes in U.S. social and political policies that have influenced the way teacher capacity is formulated, the most important of which is the significant population growth and demographic changes in urban and rural areas. Although the United States has grown and prospered over the decades in part because of its demographic diversity, the increasing diversity of the student population challenges and continues to challenge the teaching force, which for the most part remains white and monolingual. Third, the authors of this section believed it was important to address the relationship between social justice and teacher capacity. We believed that teacher educators would appreciate an in-depth and comprehensive discussion of this relationship to assist them as they consider what they are doing programmatically and in their own research and scholarship in the name of social justice. In sum, the three chapters in this section provide the reader with a historical as well as a present day view of teacher capacity and how enduring questions such as, “What do teachers need to know, care about, and be able to do?” are considered.

ORGANIZATION OF THE SECTION

This section begins with three stand-alone, but complementary and inter-connected framing chapters, which collectively illuminate the historical and ongoing evolution of the conceptualization and understanding of teacher capacity. G. Williamson McDiarmid and Mary Clevenger-Bright’s chapter Rethinking Teacher Capacity helps us to examine and learn from past efforts as we look forward to enhancing and improving programs of teacher preparation and the scholarship of teacher educators. They inform us about how teacher capacity was conceptualized and formulated from the “days of the normal school” to the present day. Here the discussion is not only about what teachers should come to know, believe and care about, but also what they bring with them to the teaching experience. Reflecting on their review of the education literature and the state of the scene in teacher education McDiarmid and Mary Clevenger-Bright argue that it now time to rethink “teacher capacity.”

Tyrone C. Howard and Glenda R. Aleman’s chapter, Teacher capacity for diverse learners: what do teachers need to know?, is a response to McDiarmid and Clevenger’s call to rethink teacher capacity. They interject a good deal of present day reality from the schools and teacher education programs into the discourse on teacher capacity and recommend a critical approach to preparing teacher candidates that connects critical multicultural theory and practice (e.g. problem-posing/Praxis: critical literacy). Howard and Aleman argue that this approach is needed in order to develop teacher capacity to change the environments in schools. They claim that, “What teachers need to know, care about, and be able to do can/should no longer be thought about in a context where inequities that relate to race, class and gender and other markers of identity are ignored or tolerated.” They point out that although the past thirty years have witnessed a good deal of research concerned with preparing teachers with knowledge, skills, and dispositions to effectively teach in a culturally diverse and low-income classrooms, this effort has fallen far short.

Carl A. Grant and Vonzell Agosto’s Teacher Capacity and Social Justice in Teacher Education is also a response to McDiarmid and Clevenger’s call to rethink teacher capacity, as well as to add to critical discourse on teacher capacity that we see in Howard
and Aleman’s chapter. Implicitly these authors argue that in the U.S., people of color have historically always had thoughts of “justice” in their knowledge, skills, and dispositions when considering both schooling for their children and the preparation of teachers—both black and white—who would teach their children and other children. Also, the authors contend that over the past two decades there has been a reawakening of attention to social justice, which a number of educators are trying to make catch hold in all of education, especially teacher education. However, Grant and Augusto argue that before the concept and practice of social justice can become embedded in teacher education generally, and teacher capacity specifically, much basic work needs to take place and be in place including, for example, definitions, guiding theories, understanding and acknowledgement of the role of context, and conceptual tools for adjudication of these issues.

The artifacts included in this section pay attention to the idea of freedom and educational opportunities for traditionally marginalized groups. They challenge members of mainstream and non-mainstream groups alike to strive for human rights and civil rights in education and all other areas of life. All the writings in this section were selected because of their elegance, advocacy, and candor.

James Baldwin’s *A Talk to Teachers*, which is a piece that has been used over the years in many teacher education programs, introduces numerous ideas that educators should contemplate when considering teacher capacity. In addition, Baldwin asserted a revealing truth in 1974, which continues to have currency today. He stated “What is upsetting the country is a sense of its own identity. If, for example, one managed to change the curriculum in all the schools so that Negroes learned more about themselves and their real contributions to this culture, you would be liberating not only Negroes, you’d be liberating white people who know nothing about their history” (p. 4).

The artifact by Maxine Greene, excerpted from *The Dialectic of Freedom* (1988), demands that we step away from the technical and rational discourse often found in discussions of teacher capacity and attend instead to the challenges and possibilities of “freedom” available in thinking about teacher capacity. “Freedom,” according to Green is “about overcoming barriers and obstacles that challenge and impede individuals from finding their true selves and realizing their potential” (Reed & Johnson, 2000, p. 125). Green argues that education should help individuals reach beyond themselves “by means of education they may be empowered to think about what they are doing, to become mindful, to share meanings, to conceptualize, to make varied sense of their worlds” (cited in Reed & Johnson, 2000, p. 126). Teacher capacity, according to Green would embrace teachers’ actions and practice which are actions of freedom.

All of Paulo Freire’s writings have major implications for thought and action about teacher capacity. *Teachers as Cultural Workers: Letters to Those who Dare Teach* (2006) is no exception. In fact, it speaks directly to the attitude/disposition dimension of teacher capacity. Freire identifies eight qualities that are indispensable to the progressive teacher; qualities he believes are acquired gradually through practice and are developed concurrently. Each of the qualities, while readily associated with teacher dispositions; also have meaning for how knowledge and skills are exercised by teachers.

Katrina B. Flores’ *They’re Calling Us Names* is the fourth and final artifact in this section—and it differs in format from the other three. It is a poem that speaks provocatively about the knowledge, skills, and attitude/dispositions teachers must have, while implicitly supporting what McDiarmid and Clevenger and others in this section argue, namely that, “the old formula of knowledge, skills and disposition are now too static and individualistic a framework for thinking about teacher capacity, limiting our understanding of what teachers need to know, be able to do and care about.” As a student who very recently lived the P/K-12 classroom experience, Flores demands that educators rethink
their notion of teacher capacity and respond to the needs and contributions of students today in order to promote their achievements and pride.

The significance of the four commentaries to the section is multiple. Each brings powerful insights that add to and extend the discussion of teacher capacity in the section. Each brings sophistication and independence of thought since they are written by scholars who are major stakeholders occupying a particular critical space within the field of education.

Chicago educators Maureen Gillette’s and Brian Schultz’s commentary, *Do You See What I See? Teacher Capacity as a Vision for Education in a Democracy*, is written from their perspectives as teacher educators at a large urban state institution noted as being the most ethnically diverse university in the Midwest. They argue that teacher candidates need to acquire content knowledge base that is multicultural and develop critical thinking skills in order to help their students succeed. Another important contribution their commentary makes to the section is the argument about the importance of collaboration between the faculty in teacher education and the faculty in the liberal sciences.

Donna M. Gollnick’s *Teacher Capacity for Diversity* locates the discussion of teacher capacity within larger issues of accreditation, particularly the work of the National Council for Accreditation of Teacher Education (NCATE). Gollnick help us to understand how teacher capacity is defined within an accreditation agency. She explains the tensions between different stakeholders regarding where emphasis on capacity should be placed in teacher education and tells us about how NCATE has been a strong advocate for diversity and social justice. In addition, Gollnick helps us to see how the meaning of social justice is in the eye of the beholder, and that a negative interpretation of this concept can lead to an attack by those who believe that “social justice” embedded within teacher capacity articulates a disposition based in leftist ideology and is politicizing teacher education.

Pam Grossman, Morva McDonald, Karen Hammerness and Matthew Ronfeldt’s *Dismantling Dichotomies in Teacher Education* argues that we should step outside of the box as we think about teacher capacity and consider it less about distinct forms of knowledge and beliefs and more about classroom practices, emphasizing the importance of integrating theoretical principles with the enactment of practice in the preparation of teachers. Grossman et al. claim that the current debate on teacher capacities has a dichotomy at its core. They contend that research in multicultural education rarely references the teaching of subject matter and that those who teach subject matter overlook issues of race, class, and language. Grossman and her colleagues offer a model of teacher capacity that views preparing teachers to teach subject matter and teaching for social justice as interdependent. To this end, they argue that three fundamental shifts are required on the part of teacher educators: (1) undo the dichotomies between subject matter and social justice; (2) focus upon helping novices develop and refine practices; and (3) explicitly prepare teacher candidates for the schools attended by the lowest achieving students.

The final commentary is Kevin’s K. Kumashiro’s *Partial Movements Toward Teacher Quality . . . and their potential for advancing social justice*. Kumashiro, from the Center for Anti-Oppressive Education and the University of Illinois-Chicago, reminds us that at a time when the official discourse in the country is narrowly defining teacher quality, it is important to remember that teacher educators have long argued that teacher capacity cannot be defined without considering its context. Using an anti-oppressive lens, Kumashiro introduces three enduring questions about the necessary and troubling relation between teacher quality and (anti)oppressive movements in school and society. Kumashiro’s queries push us to consider partiality, paradox, and resistance as we teach for change and social justice.
The overarching importance of teacher capacity

Finally, this section on teacher capacity has an exceedingly strong connection to, and in many ways helps to shape the arguments in the other sections. These include arguments about the purpose of teacher education, where teachers should acquire their professional knowledge and skills, who should be allowed to enter the profession, how teachers learn, who should govern teacher education, how do we determine teacher quality are critical and fundamental questions to improving education in the United States. In addition, these questions provide much of the contextual influences for asking “What teachers need to know, care about, and be able to do?”

9 Rethinking teacher capacity

G. Williamson McDiarmid and
Mary Clevenger-Bright
University of Washington

INTRODUCTION

In their 1861 petition, the Committee on State Normal Schools urged the California Superintendent of Public Instruction to create such schools because “a very learned man may profoundly understand a subject himself, and yet fail egregiously in elucidating it to others” (State Office, 1889). The authors then identified the areas in which teachers needed to demonstrate competence:

... the powers, capacities, and laws of growth of the mind; the order, as to time, in which the different faculties are to be addressed and developed; the best modes of their development; the special adaptation of each school study to the particular necessities and faculties of the juvenile mind; the laws of bodily health as to ventilation, posture, school calisthenics and gymnastics; ... the moral natures of children ... best methods of school organization, classification, programmes of daily exercises, and modes of teaching, as exemplified in the best systems and best schools in the world; and the knowledge so acquired is practically applied in the model or experimental school (a necessary part of a Normal School) in the presence of competent and experienced teachers.

Nearly a century and a half later, we continue to revisit what we believe teachers need to know, be able to do, and care about. This long-standing conversation about teacher capacity exhibits both continuities and discontinuities. Although policymakers, regulators, researchers, critics, and teacher educators have disagreed about how each is defined, weighted in importance, learned, and assessed, three broad categories appear to capture the spectrum of teacher capacities across time: (1) knowledge, including subject matter, pedagogical content knowledge, curriculum, pedagogy, educational foundations (multicultural as well as historical, philosophical, sociological, and psychological), policy context, diverse learners (including those with special needs) and their cultures, technology, child and adolescent development, group processes and dynamics, theories of learning, motivation, assessment; (2) craft skills, including planning, organizing, and orchestrating instruction, using instructional materials and technology, disciplining pupils, managing groups, monitoring and evaluating learning, collaborating with colleagues, parents, and community and social service agencies; and (3) dispositions, including beliefs, attitudes, values, and commitments.

As we will see, debates and assertions about the teacher preparation curriculum tend to focus on what teachers need to know and are able to do. Although no less controversial, specifying dispositions—what teachers should believe and care about—and how these are to be developed has proven more elusive. To some degree, programs have used
admissions processes and standards to address dispositions. Normal school candidates were required to demonstrate “high moral character,” presumably through the testimonies of referees. Today, selective programs, in search of candidates with dispositions the faculty deem essential, may ask for evidence of particular experiences, such as living or working in a cross-cultural setting, as a proxy for desired dispositions. Meanwhile, finger printing and background checks have formalized the process of ensuring minimally acceptable “moral character.”

Of course, teacher candidates also begin their teacher preparation programs with varying knowledge and skills, many absorbed unconsciously from observing their own teachers (Lortie, 1975). Teacher educators rely on others, such as colleagues in arts and science departments, to ensure that future teachers possess certain essential knowledge such as subject matter (McDiarmid, 1994). Building teacher capacity, thus, depends, to some considerable extent, on what teacher candidates bring with them and on the knowledge, skills, and dispositions they develop in other settings.

In what follows, we examine some of these continuities and discontinuities across time and describe developments in the social, political, and intellectual context that shape our current understandings. We also want to identify some of the key debates over teacher capacity, particular debates about dispositions. Our goal is to offer a framework for thinking both about what constitutes teacher capacity as well as how it can be best developed. In particular, we want to argue, based on what we have discovered about teacher learning and knowledge and changes in the broader context, for rethinking the timeframe, opportunities, and contexts for developing critical knowledge, skills, and dispositions. We also want to argue that the developing culture of evidence in education, fostered in large part by accountability policies, holds the promise of more rigorous approaches to assessing teacher capacity.

DEFINING TEACHER CAPACITY

“[T]he ability to receive, hold, or absorb” is the first definition of “capacity” offered by the American Heritage Dictionary. A subsequent definition, perhaps most pertinent for this chapter, is: “The power to learn or retain knowledge; mental ability.” Yet another definition suggests a dynamic dimension of capacity: “Innate potential for growth, development, or accomplishment.” All three of these definitions have implications for how we conceptualize what it is that teachers bring to teaching.

“Capacity” rarely stands alone but rather in relationship to some purpose or goal—a capacity to accomplish or perform X. When we speak of the “capacity of an organization,” for example, we are usually referring to its ability to carry out certain functions, meet particular goals and expectations. Currently, the term is used in policy circles typically referring to the efforts of schools, districts, and states to enhance the human resources needed to bring about curricular and instructional reform (Barnes, 2002; Cohen & Ball, 1999; Corcoran & Lawrence, 2003; Massell, 1998, 2000). Thus, in the current educational context, the meaning of “capacity” seems closer to the idea of “potential for growth” than to “ability to receive.”

Such an interpretation of “capacity” is also consistent with the growing understanding of learning to teach as a nearly life-long phenomenon. The journey begins with Lortie’s (1975) “apprenticeship of observation” in P-12 classrooms and continues through preservice—including both arts and sciences as well as professional preparation programs—into the induction years and beyond (Feiman-Nemser, 2001). The term “teacher
capacity” suggests the potential for teachers to continue to develop their knowledge, skills, and dispositions along the continuum.

The idea of enhancing teachers’ capacity along the learning continuum has a particular appeal because of the ever-rising expectations for teachers. As we will see, expectations, always high, have, in recent years, risen almost exponentially. Driving these expectations are a range of forces—changing demographics, policy initiatives, technology, and phenomenal growth of knowledge as well as in our growing understanding of what successful teaching requires. As we will argue, understanding teacher learning and knowledge across time also requires attention to the social contexts in which teachers find themselves.

CONCEPTIONS OF TEACHER CAPACITY OVER TIME

As the authors of a recent review of research on teachers' knowledge point out, the category of “teacher knowledge”—connoting propositional and procedural knowledge as well as dispositions—as an object of study is relatively new, appearing only in the last two and a half decades (Munby et al., 2001). The term “teacher capacity” seems to have entered the conversation fairly recently, although the underlying concept has, of course, been around for years. Over time, the job of ensuring that teachers have the requisite capacities to meet public expectations for schools has fallen to those who have provided—or overseen those who provide—professional preparation. The curricular requirements established by those who have educated and certified teachers reveal what teachers have been thought to need to know, be able to do, and care about. Using the lens of curriculum and standards to explore the history of “teacher capacity” reveals a concept that, at least superficially, appears, at least until recently, stable over time.

In the United States, the normal school movement of the nineteenth century was an occasion for defining requisite teacher knowledge, skills, and dispositions. On the occasion of opening the normal school at Barre in 1839, Massachusetts Governor Everett, foreshadowing the standard normal school curriculum well into the twentieth century, described the four “core” areas of study for teachers (Everett, 1839, quoted in Ogren, 2005). These were: (1) subject matter: “careful review of the branches of knowledge required to be taught in our common schools” (p. 42); (2) pedagogical methods: “the art of teaching, . . . those principles of our nature on which education depends; the laws which control the faculties of the youthful mind in pursuit and attainment of the truth; and the moral sentiments on the part of teacher and pupil which must be brought into harmonious action” (p. 48); (3) “the government of the school” which included the moral influence of teachers; and (4) practice teaching (Ogren, 2005). To ensure that candidates exhibited the proper ethical dispositions, “good moral character” was an admissions requirement, vouchsafed, apparently, by recommendation letters to this effect (Ogren, 2005).

Sixty years after the California Committee on Normal Schools described at the outset of this chapter, the official view of what teaching required had changed relatively little (Ogren, 2005). According to the Course of Study and Syllabus for the College Graduate Certificates (1922), the University of the State of New York instructed the state schools of education to ensure that graduates seeking provisional teaching certificates were knowledgeable in four areas: (1) psychology, both “general and educational”; (2) history of education; (3) principles of education; (4) subject matter and methods of teaching (University of the State of New York, 1922, p. 5).

These historical documents, particularly the 1922 syllabus, suggest a broad view of teacher capacity. Teachers were expected to know the content of the core school
disciplines, differentiated between elementary and secondary, as well as how to teach these subjects. In addition, they were also expected to have mastered a broad range of foundational knowledge, especially psychology and history but also sociology, school governance, philosophy and “educational theory.” Methods included “no more than 2 [out of the six prescribed for methods] semester hours . . . [of] observation and practice” (University of the State of New York, 1922, p. 5). In-school practica, often in affiliated demonstration or laboratory schools, were standard fare in the normal school and teacher college curriculum.

The idea that teachers’ capacities would need to continue developing across their careers does not appear in these documents. This may have been due to the expectation that most teachers would enter the profession on a temporary basis before moving on to other careers (Ogren, 2005). This is also consistent with an era in which general knowledge growth was comparatively slow. Changes in disciplinary and pedagogical knowledge and in demographics were not so rapid as to require teachers to frequently update their knowledge. In addition, expectations for what pupils needed to know were fairly low; few continued on into higher education, most entering the work force right out of school. With the notable exception of urban school systems, classrooms tended to be considerably more ethnically, racially, and socially homogenous than they have become and special needs pupils were either educated separately or not at all.

The Great Depression was an occasion for a re-examination of expectations for schools and teachers—at least among progressive educators. John Dewey and George Counts, in particular, argued that teachers must commit to and pursue social reconstruction, captured in the title of Counts’ controversial work, _Dare the Schools Build a New Social Order?_ (1932). Although teaching as a social and moral calling pervaded earlier commentaries and preparation programs, Counts went further. He argued that teachers were “under a heavy social obligation to protect and further” the interests of the people against those of the failed capitalist class (Counts, 1932, quoted in Cremin, 1988, p. 188). Dewey, for his part, believed that schools and teachers should “form the understanding and the dispositions necessary for movement in the direction of social change” (Cremin, 1988, p. 195)—a theme that continues to echo down to the present.

A contemporary of Dewey and Counts, Robert Hutchins, President of the University of Chicago, spoke for a more traditional stance toward the purpose of schools—and of teaching—in 1936: “Education implies teaching. Teaching implies knowledge. Knowledge implies truth. Truth is everywhere the same” (Hutchins, 1936). For Hutchins and others who rejected the social reconstruction agenda, teachers principally needed knowledge of the “eternal truths” available through the great books of the Western world and the classical curriculum—rhetoric, logic, grammar, and mathematics. It was up to a Hutchins’s protégé, Mortimer Adler, to subsequently popularize such a curriculum through his _Paideia Proposal_ (1982), adding the pedagogical gloss of Socratic seminars. Teacher capacity appears, from this viewpoint, to consist in being liberally educated and capable of orchestrating such seminars.

This debate about the purpose and goals of teaching—central to specifying “teacher capacity”—continues today. Critics of traditional university-based teacher preparation charge, in line with Hutchins, that these programs typically pursue a social reconstruction agenda and, as a consequence, fail to adequately prepare teachers (Steiner, 2003). Social reconstruction proponents continue to argue that teachers need to be committed to and pursue a social justice agenda (Cochran-Smith, 1999, 2004; McLaren, 1995; see also Howard and Aleman in this volume, Chapter 10). We will revisit this debate below.

A key related and consequential curriculum development, chronicled by Urban, was the foundations movement of the late 1920s. A group of scholars at Teachers College,
strongly influenced by Dewey and their colleague William Kilpatrick, developed a curriculum for non-methods courses that focused less on the concerns of the constituent foundational disciplines and more on educational issues through disciplinary lenses. In addition, in the tradition of both Dewey and Counts, the curriculum was intended to encourage prospective teachers to question how well schools and classrooms served democratic goals and values (Urban, 1990). Arguably, encouraging prospective teachers to take a critical stance toward schools and the status quo has frequently brought university teacher educators and preservice teachers into conflict with practicing educators.

Throughout the 1940s and 1950s, while the debate on expectations seems to have focused less on teacher dispositions and more on the school curriculum, antagonism between the social reconstructionists and the classicists continued to fuel the debate (Cremin, 1988). Those, in the Hutchins tradition, who felt that the school curriculum had been hijacked by the “life-adjustors” (Bestor, 1953)—thereby fatally diluting the intellectual and academic purposes of public schools—were in particularly high dudgeon after the launch of “Sputnik” (Rickover, 1993). For them and some part of the public, the U.S. had fallen behind the Soviets in science and technology because of the tepid “life-adjustment” fare served up by schools and teachers. Koerner (1963), speaking for others in the academy and beyond, placed the blame squarely on the doorstep of schools and colleges of education.

Other than the transformation of foundations, most elements of the curriculum remained stable while the institutional setting changed markedly (Caliver, 1933; Orgen, 2005; Pangburn, 1932). State normal schools transformed into state colleges—in response, partially, to the influx of WWII veterans—and state colleges, over time, into universities. After WWII, attention was increasingly riveted on producing a sufficient number of teachers to staff schools running double shifts to accommodate the post-war baby boom. As the number of universities housing departments of education increased, educational faculty, seeking to establish status parity with colleagues in the arts and sciences, increased their research reach and activity. Programs of research focused on teachers and teaching began to emerge. Thus, a new community—researchers—joined the conversation about teachers’ knowledge, skills, and dispositions.

An early foray into research on teacher capacity was studies to identify the personal characteristics of effective teachers (Ryans, 1960; Gage, 1963). This research sought to identify observable patterns of “classroom behaviors, attitudes, viewpoints, and intellectual and emotional qualities which may characterize teachers” (Ryans, 1960, p. 9). Absent—at least in the study that Ryans (1960) reports—is any attempt to associate characteristics with pupil learning. The findings seem to have added little to understanding teacher capacity. For instance, teachers whose principals rated them highly were found to be more favorable toward their pupils and teachers judged “warm and understanding” had more favorable attitudes toward pupils and administrators.

The alarm that Admiral Rickover and others raised over losing the scientific and technological lead to the Soviets prompted the National Science Foundation, in the 1960s, to make sizeable grants to universities and educational development organizations to overhaul school curricula and retrain teachers, particularly in mathematics and sciences but also in social sciences (Dow, 1991). Not only were teachers expected to know more about the disciplines—especially mathematics, sciences, and social sciences—but the new curricula were also grounded in the idea that pupils need to conduct their own inquiries, to act as scientists, mathematicians, and social scientists (Dow, 1991).

Against the backdrop of the Great Society and the War on Poverty, the 1960s were a time of great faith in social science as a means to solve societal problems, including low-performing African American pupils. James Coleman, a sociologist, brought sophisticated
statistical models to bear on large-scale data sets to identify the factors influencing pupil achievement (Coleman, 1966). Ironically, this research was to raise questions about the influence of teachers and other in-school factors—other than the race and class of one’s classmates—on pupil achievement (Jencks, 1972).

In the 1970s, educational researchers endeavored to establish a new science of teaching by first correlating observations of teachers’ behaviors with pupil test scores and, subsequently, experimentally testing the causal nature of particular behaviors (Gage, 1963, 1971; Rosenshine & Furst, 1972). This “process-product” research focused on identifying specific behaviors or skills—question asking, explaining, wait time, time on task, classroom management techniques, and so on—that produced pupil learning (for reviews, see Brophy & Good, 1986; Gage, 1978; Waxman & Walberg, 1991; Zumwalt, 1988). The hallmark of teacher capacity, thus, was knowledge and application of these research-validated behaviors.

This research coincided with an increasing push for accountability of public institutions in the political arena and the idea of scientifically validated, observable teaching skills resonated with policy makers (Linn, 2001). The result was state policies to ensure teacher competence, based at least in part on the findings from process-product research. Practically, these policies often manifest as extensive checklists of skills against which the classroom performances of beginning teachers were judged (Hall, 1981). This, in turn, shaped the curricula of teacher preparation programs, many of which introduced “research on teaching” courses and student-teaching evaluation forms that mimicked the state competency checklists (Cooper & Weber, 1973; Dodl & Schalock, 1973). This skills-dominated view of teaching and teachers mirrored the “back-to-basics” curriculum movement in the K-12 system.

Just as process-product researchers had reacted to the limitations they saw in research on teacher characteristics during the 1950s, researchers in the 1980s responded to the limitations they saw in process-product research. This coincided with a growing interest in developing approaches to studying and understanding learning in what has been termed the “cognitive revolution” (Gardner, 1985). Some teacher researchers explored the “interior” lives of teachers—their decision- and sense-making, thinking, and learning processes as well as their knowledge and dispositions (Clark & Peterson, 1986; Feiman-Nemser & Floden, 1986; Lampert, 1985). Teacher education programs incorporated formal opportunities for preservice teachers to “reflect,” to make manifest—for themselves and others—their interpretations of what they were experiencing in classrooms, and to take a critical stand toward their assumptions and actions (Calderhead & Gates, 1993; Schon, 1984, 1990; Zeichner & Liston, 1996). A view of teaching as continually responding to changing circumstances and interacting with the curriculum and diverse learners challenged earlier views of teaching as applying scientifically validated methods in covering the curriculum.

In the policy arena, evidence that policymakers found compelling began to mount that teachers—and their relative capacities—do, indeed, make a difference. Using econometric statistical tools, researchers found that teacher “quality”—defined by degrees, credentials, and experience—was the single most significant in-school influence on student achievement (Ferguson, 1991; Ferguson & Ladd, 1996; Greenwald et al., 1996). These findings spurred policymakers in a number of states, particularly those that had launched ambitious standards-based reforms, to increase their investment in teacher development. In Kentucky, for example, state funding for professional development increased from less than a dollar per student in the late 1980s to $24 per student by the mid-1990s (Foster, 1999).

Standards-based reforms, beginning in the 1990s, raised expectations for teacher
capacity dramatically. No longer was meeting minimum academic levels of competence sufficient; all pupils were expected to meet publicly established standards. Public accountability systems raised stakes even higher. What teachers were expected to know, be able to do, and care about had not only increased markedly but had become substantially more complex. The forces that have fueled this increase in expectations and complexity show no signs of abating.

EVOLVING AND EXPANDING CONCEPTIONS OF CAPACITY

As suggested above, the past two decades have seen more attention focused on teacher capacity than at any previous time in history. This is, as we have seen, due to a confluence of factors: research underlining teachers’ significance in pupil learning; various reports—from the Holmes Group (1988, 1990), the Carnegie Task Force on Teaching as a Profession, (1986), and the National Commission on Teaching and America’s Future (1996, 2003)—focused on improving teacher quality; and state and federal policies of high-stakes assessments and accountability. The conception of teacher capacity embedded in the curricula of normal schools and, later, state colleges and, finally, universities has burgeoned dramatically. The areas of expansion, described below, reflect currents not only in academia and policy but also in society at large.

Rethinking teacher knowledge of subject matter

A major criticism leveled at the exclusively skilled-focused view of teacher capacity was the lack of attention to teachers’ knowledge and understanding of their subject matter as a major factor in pupil learning (Shulman, 1986). Shulman and his students explored the role that teachers’ knowledge of subject matter for teaching—what Shulman termed “pedagogical content knowledge”—played in their capacity (Grossman, 1990; Wilson et al., 1987; Wilson & Wineburg, 1988). These case studies interjected into the conversation much richer and more textured accounts of teachers’ subject matter knowledge than ever before. Teachers need to know not only the substance of the discipline—long recognized as vital to teacher capacity—but also how to best represent the content to diverse learners. To do this well requires knowledge of curriculum materials, common pupil difficulties with the content, the context of learning, and the goals of the enterprise (Shulman, 1987).

Whether they acknowledge it or not, teachers draw on their typically tacit understandings of the various dimensions—substance, structure, and syntax (Schwab, 1962)—of subject matter knowledge when they plan, carry out, and assess instruction as well as when they interact with colleagues, parents, and others. To claim that this is a much richer and more textured conception of teachers’ subject matter knowledge than that on which educators and others have previously operated understates the difference. Although arguing for rich subject matter understanding, researchers in this area did not claim this is sufficient for successful teaching. Recent research, using large data sets rather than the earlier case study approach, seems to confirm what many believed self-evident: differences in teachers’ knowledge of teaching particular subject matter, which also involves substantive knowledge of the subject, produces differences in pupil learning (Hill et al., 2005).

Moreover, such rich understandings may also be necessary to ensure that pupils with diverse interests and backgrounds have equitable access to knowledge. The better teachers know the landscape of the subject matter they teach, the better able they are to
find productive points of access for different pupils (McDiarmid, 1991, 1993). This view of the role of teachers’ subject matter knowledge overlaps with the idea of teachers’ responsibilities for providing equitable access to knowledge.

Revisiting teachers’ social responsibilities

The modern civil rights movement prompted scholars and advocates to agitate for greater attention to teaching poor children and those of color and to addressing the effects of race, social class, and gender differences on learning opportunities (Banks, 1988; Grant & Sleeter, 1996; see Grant & Agosto, this volume, Chapter 11). In the wake of the Brown decision, African Americans, Mexican Americans, American Indians and other groups demanded school curricula that reflect the range of experiences, histories, and cultures that make up the U.S.—as well as teachers with the knowledge, skills, and dispositions to work successfully with children of color (Banks, 1988). By 1977, the National Council for the Accreditation of Teacher Education Standards required teacher preparation programs to include multicultural courses and components (NCATE, 1977). In addition to knowing the history and cultures of ethnic, racial, and social groups, teachers were expected to know about the learning preferences and linguistic challenges of pupils from different backgrounds (Banks, 1988; Grant & Sleeter, 1996).

As the accountability movement picked up steam during the 1990s, states implemented pupil assessment and school accountability systems to identify “failing” or “at-risk” schools. This drew renewed attention to the disparities in test scores between and among schools serving different groups of pupils—Euro-American, Latinos, African Americans, American Indians; rural, urban, and suburban; rich and poor; native speakers and English language learners; regular and special needs (Johnston & Viadero, 2000; Farkas, 2003; Jencks & Phillips, 1998). Assessment results from schools and districts around the country provided yet more evidence that teachers, especially those in high-needs schools, needed better preparation to work with pupils who came from historically under-served populations (Ladson-Billings, 1999, 1994; Gay, 2002; Sleeter & Grant, 1987).

Beginning in 2001, federal No Child Left Behind (NCLB) legislation raised the heat on educators even higher by requiring that assessment data be disaggregated by subgroups and that schools meet improvement goals for all the subgroups or face sanctions. The persistent “gaps” in test scores between students of Euro-American origins and those of color have prompted states and districts to develop and publish standards for “cultural competency” to which teacher preparation programs must respond (for example, see Alaska Department of Education and Early Childhood, 1999; Oregon Department of Education, 2004; Seattle Public Schools, 2005). In addition to greater knowledge of various groups as well as their own cultural viewpoints, teachers are expected to teach in “culturally responsive” ways (Gay, 2002; Ladson-Billings, 1999).

Rethinking teachers and democratic education

In a related vein, John Goodlad and his colleagues, building on a theme central to Dewey and earlier progressives, have argued, over the past two decades, for greater attention to the unique and critical role that schooling and teachers play in a democratic society (Goodlad, 1997; Goodlad & McMannon, 1997; Soder, 1995; Soder et al., 2001). In this view, teachers are responsible for nurturing the democratic dispositions, habits, and practices of their pupils even as they ensure pupils learn academic knowledge and skills. At the heart of their argument is the fundamental democratic value of ensuring equitable access to knowledge for every pupil—a theme central in multicultural arguments as well
(Goodlad & Keating, 1994). Although this presupposes some minimal level of classroom skills and knowledge, teaching in support of the “democratic agenda” is primarily dispositional. That is, possessing and acting on commitments to access to knowledge for all learners, cultivation of democratic values, and stewardship of public schools.

For some—heirs to George Counts’ “social reconstruction” mission—educating pupils to be knowledgeable, participating, and productive citizens of their communities and the country is not enough. They argue that teachers must help their pupils understand the inequities—of power as well as wealth—inherent in capitalist social and economic institutions and society at large (McLaren, 1995). For these critics, multicultural education is insufficient to the task; conditions call for a “multicultural revolution.” From this viewpoint, teacher capacity includes not only the knowledge of how the economic and social system operate to maintain a repressive status quo but also commitment and actions to change the world, to change the distribution of power and resources. As we argued above, the implications for teacher capacity are primarily in the arena of dispositions.

Rethinking standards and accountability for teachers

In A Nation Prepared (1986), the Carnegie Task Force on Teaching as a Profession provided a view of teachers’ work that is notably ambitious and comprehensive. Partly a response to A Nation At Risk—the 1983 report decrying the economic crisis purportedly created by substandard public education in the U.S.—the report describes what pupils and their teachers need to know to keep up with a rapidly changing world of work:

Teachers should have a good grasp of the ways in which different kinds of physical and social systems work; a feeling for data and what uses to which they can be put; an ability to help students see patterns where others see only confusion; an ability to foster genuine creativity . . .; and the ability to work with other people in work groups that decide for themselves how to get a job done. They must be able to learn all the time . . . Teachers will not come to school knowing all they have to know, but knowing how to figure out what they need to know . . .

(p. 25)

To help recognize teachers with these capacities, the report called for the creation of a National Board for Professional Teaching Standards “to establish standards for high professional teaching competence” (p. 66). This reflected a broader movement toward establishing standards for teachers as well as pupils. Professional associations such as the National Association of Teachers of Mathematics (1989) and the American Association for the Advancement of Science (Rutherford & Ahlgren, 1990) led the way, publishing standards for both pupils and teachers. Individual states, prompted in part by the federal Goals 2000 legislation, also developed standards for pupils and teachers.

Perhaps no single development has raised the profile of teacher capacity more than the implementation of pupil assessment and accountability systems in virtually all the states (Linn, 2000). State departments of education and districts as well as schools invested heavily in increasing teacher capacity through professional development. Many states also instituted tests for teachers—at first, in basic skills and, subsequently, in subject matter and pedagogical knowledge (Darling-Hammond, 1999).

Close on the heels of state-developed standards, assessments, and accountability systems, the federal government entered the fray directly. Until the end of the last century, determining the adequacy of teachers’ knowledge, skills, and dispositions was left to the states. The reauthorized Higher Education Act, in 1998, forced states to report to the
U.S. Department of Education a range of data intended to capture the quality of teacher preparation in the state. NCLB legislation requires that states and districts ensure that all pupils are taught by a federally defined “highly qualified” teacher. In defining what this means, the architects of the legislation reveal their conception of teacher capacity: “To be deemed highly qualified, teachers must have: (1) a bachelor’s degree, (2) full state certification or licensure, and (3) prove that they know each subject they teach” (U.S. Department of Education, n.d.). Although this appears to reduce teacher capacity largely to knowing the subjects taught, the requirement for state certification suggests that teachers also need professional knowledge, as defined by the state.

Equally important, the federal government has, concurrently, attempted to wrest control of certification away from the states as well. The U.S. Department of Education has supported—to the tune of $40 million to date—the creation of the American Board for Certification of Teaching Excellence (ABCTE), an alternative to state certification. Applicants must pass online tests in both subject matter knowledge and professional knowledge, acknowledging, as does NCLB, that teaching requires more than knowledge of content alone (American Board for Certification of Teaching Excellence, n.d.).

ABCTE proponents are vocal in their determination to end the “educational establishment’s” purported “monopoly” on teacher standards and licensing (Blair, 2003). Yet, standards for ABCTE and those for the National Board for Professional Teaching Standards (NBPTS) overlap considerably, although the former has, to date, published standards only for beginning teachers (the NBPTS Standards are designed for experienced teachers). Both sets of standards include; (1) knowledge of content areas; (2) classroom skills, including organizing, planning, and designing lessons; managing diverse groups of pupils; using a range of instructional approaches; differentiating instruction according to individual needs; and monitoring and evaluating pupil learning; and (3) working with parents.

Areas where the standards differ represent, on the other hand, markedly divergent conceptions of teacher capacity. Perhaps because their audience is beginning teachers, the ABCTE Standards tend to be more prescriptive (“communicating by listing the lesson objectives” “present material in a logical sequence with small steps”) and appear to draw heavily on practices identified as effective in process-product research—questioning techniques, time on task, graphic organizers, and so on. In short, ABCTE has taken a “social efficiency” (Zeichner & Liston, 1990) view of teacher capacity.

The NBPTS, on the other hand, includes practices that seem as much dispositions as skills, such as “thinking systematically about . . . practice and learning from experience” and “working collaboratively with other professionals on instructional policy curriculum development and staff development.” The NBPTS standards appear informed by a broader conception of teacher capacity, a conception that is infused with the rethinking of teacher knowledge, skills, dispositions, and learning that has occurred over the past couple of decades.

Another area of teacher capacity that has emerged in the last decade, has been strongly supported by federal and state agencies, and, yet, figures marginally if at all in standards is the classroom use of information and instructional technology. The federal government has made substantial investments in improving the classroom technological knowledge and skills of educators—practicing teachers, preservice teachers, and teacher educators alike. NCLB includes support for enhancing teachers’ ability to use informational technology in the classroom (Department of Education, n.d.). At least ten states have explicit educational technology standards (Council of Chief State School Officers, n.d.). Yet, knowledge of informational and instructional technology does not appear in the ABCTE standards (American Board for Certification of Teaching Excellence, n.d.) and receives
only brief mention in other standards. One need not accept exaggerated claims for the power of informational technology to revolutionize education to acknowledge the potential of this technology to significantly enhance both teaching and learning.

Rethinking teacher learning and expertise

As noted above, over the past three decades, evolving understandings of how we learn and how we develop expertise have influenced profoundly how we think about what teachers need to know, be able to do, and care about. Specifically, two areas seem to bear, in particular, on our current understanding of teacher capacity: the first is the role that social context plays in our learning and understanding of ourselves, our actions, and our surround; the second is how we develop and deploy our understanding and knowledge over time.

Teaching knowledge and practice as socially mediate

The growing understanding of teaching as a practice that is mediated by the social contexts in which it occurs has profoundly influenced thinking about how to support teachers in maximizing their capacities. Research has deepened our understanding that our experiences are filtered through our socio-cultural surround and the language we use to represent these experiences (Brown et al., 1991; Luria, 1976; Vygotsky, 1962, 1978; Wertsch, 1985). The knowledge, skills, and dispositions that individual teachers bring to teaching are, to a large extent, the products of the social contexts in which these were developed. The “apprenticeship of observation” is not confined to schools. The conceptions of “knowledge,” “teaching,” “learning,” and so on that pervade actions, organizational structures, social relations, and curriculum materials in schools reflect those that pervade experiences outside school and the broader culture (Cohen, 1988). This suggests that the context in which “capacity” is developed is defining, however imperfectly.

We come to understand core concepts—“knowledge,” “content,” “knowing,” “teaching,” “learning,” and so on—through our interactions with others and our environment. Viewed in a political context, social cognition theory intersects with critical theory: our concepts and the language we use to express them are not value-neutral, socio-cultural constructs; they are shaped by the socio-historical circumstances of unevenly distributed political and economic power (Lakoff, 2000). That is, our concept of “knowledge” itself is defined through a political process. In this process, particular social groups, because of their resources, are able to shape, however imperfectly, fundamental concepts and how they are represented. Not only are our understandings socially mediated but specific historical and political forces also shape the social contexts in which the mediation occurs, as well as the process of mediation itself. Clearly, this is not a rigidly deterministic process—if it were, critical theorists would not exist. It does suggest, however, the profoundly social, cultural, and political character of our understandings, including our understanding of “teacher capacity.”

The act of teaching is socially and politically negotiated. What teachers can and cannot do within their classrooms depends, in large part, on others in their surround—colleagues, pupils, administrators, parents, journalists, civic leaders, taxpayers, policymakers, textbook publishers, and so on. The content they teach as well as how they teach it are the products of negotiations between the teacher and a range of policies, materials, and key others. Content standards, curricula, standardized assessments, textbooks, software, and other instructional materials typically represent the ideas of others about what should be taught and how. Thus, to establish their practice, to act in concert with their knowledge,
beliefs, purposes, and commitments, teachers must negotiate with key others. Yet the skills, knowledge, and dispositions required for productive social and political negotiations are rarely included in various conceptions of teacher capacity.

Also informing our understanding of teacher capacity is the concept of “situated learning” (Lave & Wenger, 1991). Closely related to socio-cultural theories of learning, the concept captures the idea that learning is, to a substantial degree, a function of the context in which it takes place. A particular idea or practice encountered in a K-12 classroom will be understood differently than if encountered at the university. This helps explain the “two worlds” phenomenon so familiar in teacher education; generations of student teachers have found themselves caught between the expectations of university educators and the realities of school classrooms (Feiman-Nemser & Buchmann, 1983). Such an understanding of learning has implications for both preservice preparation and professional development.

The socially mediated and contextually situated nature of learning also suggests that resources and attention have been disproportionately focused on the development of teachers as individual practitioners, as opposed to members of local “communities of practice” (Little, 1993; Wenger, 1998). School cultures and climate are collective products of educators, pupils, parents, and others in the setting. Even in those instances where teachers isolate themselves, confine themselves to their classrooms and avoid engaging colleagues, they are contributing to a particular school culture and climate. Much of what teachers do, they do in groups, especially creating learning opportunities through choosing, using, and evaluating curricular materials, instructional and assessment methods, and classroom management approaches. In the process, they undergo change and contribute, unwittingly at times, to shared understandings of practice, however tacit these may be.

Workplace learning is best understood, then, in terms of the communities being formed or joined and personal identities being changed. The central issue in learning is becoming a practitioner not learning about practice. This approach draws attention away from abstract knowledge and cranial processes and situates it in the practices and communities in which knowledge takes on significance.

(Brown & Duguid, 1991, p. 48)

The argument for purposefully transforming schools into “learning communities” rests on the idea that teaching practices and their under-girding, often tacitly-held understandings need to be made explicit and examined collaboratively. The process of “becoming a practitioner” needs to be an explicit and collective subject of focus for collegial learning communities (Kardos et al., 2001).

Thus, teacher capacity, in this view, includes productive participation in these processes of building, collectively, school cultures and “communities of practice.” As the work of McLaughlin and Talbert (2001) suggests, however, professional collaboration is not sufficient to improve teaching practice. A critical stance toward practice, one that relies on evidence of practice and pupil learning, may be a necessary corollary.

Although this may have always been a dimension of teacher capacity, our growing understanding of practice as socially mediated has dramatically raised its profile. This suggests that changing the social contexts in which teachers learn and develop may be necessary for real changes in their understanding of their role, the purposes of schooling, and core educational concepts and skills.
Adaptive expertise

A second area of investigation in the learning sciences that speaks to teacher capacity is expertise—specifically, the idea of “adaptive expertise.” Expertise itself has been a focus of research for several decades with increasing attention to the concept in teaching (Bereiter & Scardamalia, 1993; Chi *et al.*, 1988; Leinhart, 1988; Steinberg & Grigorenko, 2003). Summarizing the results of recent studies of expertise, Hatano and Oura (2003) distinguish between “routine” experts “who have had years of problem-solving experiences in a given domain, can solve familiar types of problems quickly and accurately,” but often fail to go beyond “procedural efficiency” and “adaptive” experts who “can go beyond the routine competencies, and can be characterized by their flexible, innovative, and creative competencies within the domain, rather than in terms of speed, accuracy, and automaticity of solving familiar problems” (p. 28).

Growing interest in adaptive expertise coincides with increasing attention within the field of teacher education to the idea of a continuum of teacher learning across preparation, induction, and career mentioned above. Viewing teacher development in this way draws attention to the lack of coordination and collaboration at the transition points along the continuum but also to the need to reconsider what teachers need to learn at different points. Educating teachers who develop into adaptive experts within a few years requires a rethinking of not only appropriate learning opportunities but their timing as well.

Viewed as the development of expertise, teacher capacity encompasses teaching as a continuously and rapidly evolving activity. Not only are the demographics of schools and classrooms changing but so too is our knowledge of the social, technological, and natural world (Hage & Powers, 1992; NCTAF, 2003). In addition, federal, state, and local mandates, reforms, and programs come and go, creating a turbulent policy environment (Tyack & Cuban, 1995). At a more micro-level, classrooms and schools are dynamic environments, changing according to the pupils present as well as the curriculum, the time of day, week, and year, and in response to outside events—in the school, families, communities, and beyond. Pupils themselves, as individuals and in groups, are constantly changing—intellectually, physically, socially, and emotionally.

As a consequence, the concept of teacher capacity must include how teachers adapt to these changes and manage the dynamics of the classroom and the school. On the one hand, such constantly changing circumstances and the normal busy-ness of classrooms demand the establishment of routines just to make the teaching enterprise manageable. On the other, the unpredictability of how these changes in so many different spheres will interact over time suggests adaptability as a critical dimension of teacher capacity. Indeed, as Grossman (1995) has pointed out, teachers are constantly creating new knowledge on the fly. That is, they are digesting and interpreting information from their immediate situation through the filters of past experiences, their social context, and their accumulated knowledge, skills, and dispositions. The resulting knowledge is the basis for their decisions and actions that, in turn, initiates a new round of gathering and digesting information. Thus, teachers’ capacities are in constant development and change.

Ball and Cohen (1999) have argued that teachers learn “in and from” practice. As they have written, “Teaching occurs in particulars—particular students interacting with particular teachers over particular ideas in particular circumstances . . . no amount of knowledge can fully prescribe appropriate or wise practice” (p. 10). Teacher capacity, from this point of view, consists both in establishing routines and being prepared to adapt to specific circumstances that change rapidly and often unpredictably. In the first instance, developing routine expertise consists in learning to solve a particular set of
problems—say, the repeated failure of pupils in particular circumstances to turn in homework. As long as the teacher-expert continues to work with pupils in the same circumstances, the routines work. If the pupils change, the routine expert may be stuck with approaches that do not work well (and may end up blaming the pupils). Teaching, therefore, like other occupations pursued under conditions of uncertainty and rapid change, require the purposeful development of adaptive expertise (Bransford et al., 2005).

As we argued above, teaching has increasingly been understood as a socially mediated practice. This suggests that the development of expertise must similarly be understood not merely as an individual phenomenon but a collective outcome. Whether or not teachers develop either routine or adaptive expertise depends, to a great extent, to the contexts in which they work. Indeed, developing adaptive teaching expertise may depend on contexts in which flexible, innovative, even adventurous practice is supported and encouraged—or, at the very least, not punished. This speaks to the importance of the school context and communities of practice as well as policy contexts in which teachers are, at the very least, comfortable trying out, evaluating, and refining innovative practices.

The old formula of “knowledge, skills, and dispositions” now seems too static and individualistic a framework for thinking about teacher capacity, limiting both our understanding of what teachers need to know, be able to do, and care about and how to ensure they develop their capacities over time. The collaborative framing of the particular circumstances, events, and problems teachers encounter—so critical to their choosing a course of action—is a more specific, dynamic, fluid, uncertain, and socially mediated activity than is captured in these categories. In addition, perhaps central to the entire enterprise is the disposition and ability to step outside of one’s practice and examine it in good company and in light of a range of data. The data need to include not only evidence on pupil learning, growth, and development as individuals, workers, community members, and citizens but also colleagues’ insights and perspectives as well as community expectations, needs, and goals.

THE DEVELOPING CULTURE OF EVIDENCE

As noted above, much current policy is directed toward increasing accountability for teachers and for teacher preparation programs. In response, many schools are currently engaged in trying to change their cultures so that decisions about instruction and curriculum are based on the analysis of pupil data in which teachers are collectively involved. This represents attempts to change the way schools make decisions by fostering a “culture of evidence” within the school, a culture in which decisions are based on a careful consideration of quality data.

States, districts, and schools have been collecting masses of evidence for many years. This evidence has, apparently, seldom been analyzed and interpreted in ways that drive curricular and instructional decisions toward continuous improvement (Fitz-Gibbon, 2002; Hedges, 2003). Drawing on Toulmin’s conception of “warrants” as the vital link between data and conclusions in an argument, Hedges writes,

... a culture of evidence must pay attention not only to evidence, but also to the warrants that link evidence of various kinds to conclusions. Warrants clearly encompass ideas about methods for drawing conclusions given evidence. One of the major contributions of a culture of evidence is not only to make use of evidence, but to make the process of drawing conclusions transparent. That is, a culture of
evidence makes explicit what particular evidence may be linked to a conclusion, but also makes the methodological assumptions, the link between the evidence and the conclusions, explicit.

(p. 3)

Hedges’ argument underlines the need to engage teachers, in communities of practice, in making sense of data and implications for practice. Such an approach differs significantly from one in which an administrator interprets the data and attempts to direct classroom practice.

Participating in a culture of evidence suggests that conceptions of teacher capacity include the skills, knowledge, and dispositions to collaboratively collect, analyze, and interpret evidence and translate interpretations of evidence into improved learning opportunities. Classroom assessment has long been a commonplace in some, but by no means all, teacher preparation programs. The inclusion of such courses may not, however, be enough. As schools, under various pressures, move toward greater collective attention to disaggregated evidence of pupil learning, novice as well as experienced teachers may need collaborative opportunities to learn these skills applied to a variety of evidence—both evidence generated as a part of instruction as well as external assessments (Hedges, 2003; Taylor & Nolen, 2004).

As recent reviews of the research on teacher preparation suggest, teacher educators have not systematically and convincingly examined the effects that preparation programs and professional development have had on both classroom teaching practices and pupil learning (Wilson et al., 2001; Cochran-Smith & Zeichner, 2005). Developing cultures of evidence within such programs may be a necessary prerequisite to preparing teachers to participate in similar cultures in schools. Not only could analyzing and interpreting evidence—of program impact both on current students and on graduates and their pupils—improve programs, such an orientation provides a model for prospective teachers.

CONCLUSION

Continuities and discontinuities characterize thinking and writing about teacher capacity across time. Schwab’s (1973) “commonplaces” of teaching and curriculum building—the learner, the teacher, the milieu, and the subject matter—continue to be useful categories. We continue to debate what teachers need to know, be able to do, and care about. At the same time, our understanding of all these concepts has changed radically over time in response to a range of forces—intellectual, social, technological, and political.

Heightened expectations for teachers, driven in part by changes in the policy environment, have also changed our concept of teacher capacity. Published test scores have forced schools and teachers into a harsh public spotlight—or, perhaps more aptly, into the headlights. At the same time, we have also learned a great deal about what teachers need to do to be successful with every learner. Increasingly, we are recognizing that teachers cannot possibly learn all that they need to know in preservice programs. States and districts are responding by devoting more attention to induction supports for novices. Recognition that teachers must adapt to rapidly changing circumstances in classrooms, curriculum, and policy has prompted rethinking of the supports and learning opportunities teachers are provided across their careers. Increased understanding of the socially mediated nature of practice is also forcing a reconsideration of the pervasively individualistic approach to teacher development.
To develop their capacities, teachers may require improved opportunities to collaborate with colleagues in rethinking their practice based on various evidence of pupil learning. This, in turn, posits schools in which administrators, pupils, parents, community members, and key others understand that to improve pupil learning teachers need time and opportunities to collaborate. For genuine learning communities to develop, school schedules, teacher workloads, and district policies must reflect this understanding.

Merely affording teachers time to get together will not, however, automatically produce better practice. Such opportunities must be focused on evidence of learning and the implications of the evidence for practice. Developing cultures of evidence in schools—as well as in higher education—will require time but appears essential to improve learning. Teachers need opportunities to develop the knowledge, skills, and dispositions necessary to collaboratively analyze evidence of pupil learning and determine implications for practice. During the induction years, novice teachers, as they develop their practice, need opportunities to collaborate with veteran colleagues in examining evidence of practice (Johnson et al., 2004a; Johnson, et al., 2004b; Kardos, 2004; Kardos et al., 2001). Because not all schools are true learning communities, teachers may also need to develop the political skills necessary for building such communities.

Developing teacher capacity to succeed with every pupil, especially those historically under-served and those with special learning needs, similarly requires rethinking. Pre-service programs have, for many years, included courses on multicultural education and at least some exposure to special education issues. Yet, the gaps in pupil achievement, high school graduation, and college attendance persist and inclusion continues to be a problem in some schools. This raises a question about the efficacy of the approaches teacher educators have been taking. The expectation that increasing teachers’ propositional knowledge about the cultural background and social circumstances of under-served pupils, culturally responsive teaching, and special education generally would, by itself, produce classroom practices that lead to learning for all pupils may have been misplaced.

To better prepare teachers to succeed in helping under-served pupils requires greater attention to the efficacy of current approaches. Developing a culture of evidence is as essential to improving teacher preparation as it is to improving schools. Teacher educators and their Arts and Sciences colleagues need to collect evidence of the impact of their practices on preservice teachers and the subsequent impact of these teachers on their P-12 pupils. Far from a simple task, such evidence-based examination of practice and programs is critical for enhancing teacher capacity. The challenge for teacher educators, as it is for P-12 teachers, is not merely to collect valid data but to make analysis, interpretation, and practice and program adjustment a regular part of their collective work.

Another apparent continuity is recognition of public education’s and, therefore, teachers’ central role in maintaining and extending democracy. Yet, the assessment and accountability policies emanating from state and federal government over the past two decades seem to have narrowed the purposes of schooling. Despite the protestations of accountability advocates, large majorities of teachers report that state assessments drive what and how they teach (Pedulla et al., 2003). While acknowledging that academic knowledge and skills are essential, proponents of democratic education worry that the dispositions, knowledge, and skills necessary for informed and productive engagement in the public arena are being ignored.

Fostering the disposition to engage and contribute in the public arena is necessary for maintaining a democratic society. Enhancing pupils’ sense of agency—a sense that, in conjunction with others, they can influence their social, political, and natural surround—underpins such a disposition. Direct experience of efficacious agency promotes this
sense. From this point of view, teacher capacity thus includes creating opportunities for pupils to experience agency. Supporting pupils in changing their environment, however immediate and small-scale that may be, provides that experience.

Similarly, creating classroom and school-wide norms that ensure that adults and pupils feel comfortable speaking—from their direct experience as well as from other sources—on public issues, listen closely and respectfully to others, and engage in reasoned debate are not measured on any assessment yet arguably teach the very dispositions and skills essential for a democratic society. A definition of teacher capacity that ignores educators’ responsibility to establish, teach, and enforce these norms contributes to the erosion of a primary rationale for “common schools.”

In short, we cannot go back to a time when prospective teachers were taught a menu of knowledge, skills, and dispositions, given a few weeks of practice teaching, certified, sent out into classrooms, and “inserviced” a few times each year. The enterprise is too demanding, the consequences of failure too dire for pupils, their families, and our democracy. In the past two decades, we have learned much more than ever before about both what teachers need to know, be able to do, and care about and how these things are learned. At the core of these understandings is new appreciation for the degree to which teacher capacity and learning are social phenomena that occur across time and settings. At the same time, changes in the policy context threaten to narrow our concept of teacher capacity in ways that short-change the values and knowledge vital to a democratic society. Programs and opportunities to learn—at the preservice, induction, and inservice levels—intended to support teachers need to catch up with our expanded understanding of teacher capacity.

NOTES

1 Although this may be obvious, we need to keep in mind that our ideas are not strictly determined by the social, political, ideological, and economic forces that dominate at any given historical moment. “Functionalist fantasies” (Cohen & Rosenberg, 1977), however tempting, deny human agency and reduce complexities to corrupting oversimplifications.

2 The widespread adoption of cohort models in preservice teacher education is, in part, an effort to promote the dispositions, habits, and skills needed to build and maintain professional communities. Some graduates of cohort-based programs report, however, that the schools in which they are hired do little or nothing to encourage the collaboration fostered in their preservice programs.

3 The irony is that the NCLB legislation was designed to address the unequal results of schooling, requiring schools to disaggregate standardized pupil assessment data by under-served race and/or ethnic groups, English language proficiency, and special needs and penalizing schools that fail to improve results for every subgroup. By placing such an emphasis on a single annual assessment in a few subject areas—typical, mathematics, reading, and writing—the legislation pushes the teaching of other vital knowledge, skills, and dispositions to the margins—or, off the table completely.

10 Teacher capacity for diverse learners
What do teachers need to know?

Tyrone C. Howard

Glenda R. Aleman
California State University Dominguez Hills

ABSTRACT

Teacher capacity has concerned itself with the knowledge and dispositions that are required to teach in P-12 classrooms. However, some suggest that many of these efforts have fallen short in helping to create equitable learning environments for all students. In this work, we examine the historical depictions of teacher capacity, examine the salient research on teacher knowledge for diverse learners, and finally we offer recommendations for reconceptualizing teacher capacity for diverse learners.

Only within the past 30 years has the issue of student diversity been part of the teacher capacity discourse. The AACTE endorsed multicultural education in 1973. In the document No One Model American, they call for the profession to respond to the increase in cultural pluralism (Nieto, 2000). AACTE’s push for addressing diversity in teacher education was followed up by NCATE’s call for all member institutions to place more attention on preparing its candidates for teaching in diverse school settings. However, a review by Gollnick in 1995 revealed that most teacher education programs still had few substantive programs or courses that addressed issues of diversity. Other reviews on the topic of preparing teachers for diverse school settings have reached similar conclusions, arguing that while there is a pressing need to prepare teachers for teaching diverse learners, issues pertaining to diversity have typically been separated from the rest of the teacher education curriculum (Cochran-Smith et al., 2003; Ladson-Billings, 1995; Hollins & Guzman, 2006; Zeichner & Hoefl, 1996).

The history of teacher preparation reveals an ongoing search to identify the most useful means of preparing teachers and to characterize the capacity that each teacher must possess to help educate the nation’s student body population. Yet, mostly absent from the discourse, research, and recommendations have been discussions of teachers’ capacity to teach non-mainstream students—those who are poor and/or who come from culturally diverse backgrounds. Despite years of committees, consortiums, and task forces dedicated to the creation of core standards, essential knowledge, and effective practices in the field of teacher education, more attention is needed to the changing demographics in the nation’s schools.

In this chapter we examine teacher capacity for teaching diverse populations. Building on the work of McDiarmid & Clevenger-Bright and Grant & Agosto (this volume) we define teacher capacity as the core knowledge, skills, and dispositions that teachers
should possess to teach in today’s classrooms. More specifically, we define these knowledge and skills as the command of subject matter and pedagogical content knowledge. We also include in our description of capacity an awareness of the social and political contexts of education and the development of critical consciousness about issues such as race, class, gender, culture, language, and educational equity. We emphasize teachers’ capacity to teach diverse learners because of the need to prepare teachers for the growing ethnic, racial, linguistic, and social class diversity in the nation’s schools. According to the U.S. Department of Education, students of color currently comprise close to 40 percent of the U.S. school population (National Center for Education Statistics, 2003). The U.S. Census Bureau (2000) estimates that by the year 2050 African American, Asian American, and Latino students will constitute close to half of the entire U.S. student population. In a number of cities such as New York, Los Angeles, Chicago, Philadelphia, and Washington D.C., students of color already make up the overwhelming majority of the student population (Hodgkinson, 2002). Furthermore, the number of students whose primary language is not English has increased dramatically over the last 20 years, going from 1.5 million in 1985 to 5.5 million in 2005 (Villegas & Lucas, 2002; U.S. Department of Education, 2002).

In this chapter, we pose fundamental questions that are at the core of teachers’ capacity to teach in a diverse society, including: what are the essential skills, knowledge, and dispositions that are needed to educate students in a diverse society? Are teacher education programs aptly suited to teach this capacity to pre-service teachers? One of our primary objectives is to frame the discourse about teacher capacity in a manner that is inclusive of the dynamics and complexities involved in preparing teachers to teach in classrooms that look drastically different from schools in years past. We believe it is imperative to frame an analysis of teacher capacity squarely within the context of the diversity that has become the fabric of the country and of the nation’s schools. Unfortunately, historical understandings of teacher capacity have generally failed to incorporate important variables involved in teaching diverse populations.

Despite dramatic changes in the school population, discussions about teachers’ core knowledge generally focus primarily on subject matter and pedagogy. These are certainly very important. We recommend, however, that the inclusion of empirical and conceptual research that has examined effective teaching practice with diverse learners be given much more serious consideration in descriptions of teacher capacity. Thus we organize the following discussion around three aspects of teachers’ capacity to teach diverse learners: (1) subject matter and pedagogical content knowledge, (2) knowledge of effective practice about teaching in diverse settings, and (3) the development of a critical consciousness.

SUBJECT MATTER AND PEDAGOGICAL CONTENT KNOWLEDGE

Amidst ongoing debates regarding the professionalization of teaching, the role of varying governing bodies over certification, and the essential skills needed to teach, subject matter knowledge has arguably emerged as the most important area of teacher capacity. The importance of subject matter knowledge has been part of the discourse regarding teacher preparation for at least the last two centuries (Darling-Hammond, 2005). The challenge has always been clear: teachers should have a deep knowledge of the subject matters that they teach (Shulman, 1987; Munby et al., 2001; Wilson et al., 1987). More important, a long line of research has revealed that teachers who have strong background knowledge in their content areas produce higher outcomes in student learning in certain subject
areas (Darling-Hammond, 2000; Goldhaber & Brewer, 2000). At the extreme, the U.S. Department of Education (U.S. DOE, 2002) and the American Board for the Certification of Teacher Excellence (2003) both assert that mastery of subject matter knowledge and verbal ability are the only empirically supported characteristics of high quality teachers.

Although some research has maintained that mastery of subject matter is the most essential aspect of teacher capacity, others state that the mere knowledge of subject matter alone is insufficient for teachers. Equally crucial for teachers is accurate command of the subject in ways that can be communicated to diverse learners. This includes breadth and depth in the critical concepts, themes, and skills most germane to the subject, which would allow the content to be presented in a multitude of ways (Grossman et al., 2005). Each of the major areas of study, English/Language Arts, mathematics, social studies and science have established essential content standards that embody central concepts of the discipline, and each area stresses content and process as part of the mastery of the subject. Some research has shown while teachers who have majored in the area they are teaching is an important predictor of student achievement (Monk, 1994; Monk & King, 1994) teachers who have a rich, deep, or organizationally clear concept of their subject area in a manner suitable for teaching may be more effective in teaching that material to students (Ball & Bass, 2000; Ma, 1999); hence the important of pedagogical content knowledge.

An increasing amount of research has been dedicated to examining the influence of subject matter knowledge on teacher effectiveness and student learning, and the findings of these studies have been less than conclusive. Floden and Meniketti (2005) provide an exhaustive review of the correlation between subject matter study and teacher effectiveness. What we infer from their findings is that the mere exposure to subject matter alone does not ensure teacher effectiveness. In short, Floden and Meniketti argue that additional empirical research about the relationship between subject area study and teacher effectiveness is needed. The area where there appears to be the most empirical research is in the field of secondary mathematics, where a positive association between the study of math and the learning of math by students was found in several studies (see Wenglinsky, 2002; Wilson et al., 2001; Wilson & Floden, 2003). Monk (1994) using data from the Longitudinal Study of American Youth found that the amount of college coursework math and science teachers have taken in their content areas was positively related to student achievement gains. Similar research by Begle (1979) and Goldhaber and Brewer (2000) also found that content area expertise makes a difference in student learning. However, in the areas of English and social studies there is very little research about the benefits of course study and teacher practice and effectiveness on student learning. However, Floden and Meniketti’s (2005) review that in the area of science, the more science courses that teachers had taken the more positive the students’ dispositions were toward science. Therefore, while we would suggest that subject matter knowledge continues to be an essential component of teacher capacity, it is clear that additional research is needed to assess the relationship between teachers’ content knowledge, practice, and student learning. Additional investigations are needed to assess not simply the quantity of subject matter content pre-service teachers receive, but also the quality and type of exposure. Historically, discussions about teacher capacity have taken the stance that the more exposure pre-service teachers have to subject matter content, the better command they have of it. However, findings from several of the studies mentioned above suggest that additional research is needed to examine what, if any, correlations exist between subject matter command, teaching practice, and student learning—with particular attention being given to these influences across diverse learners.
Increasing concerns about teachers’ knowledge of their subject matter has resulted in the implementation in many states of subject matter assessment exams before teachers can gain full certification. As of 2005–2006, 42 states and the District of Columbia required that new high school teachers pass a subject matter assessment, and 33 required subject area majors for high school teachers. Assessment measures such as the Praxis I and Praxis II exams, which assess teaching skill and subject area content knowledge, have gained increasing prominence in states across the country. A number of educational organizations have challenged the prevalence of such exams, contending that historically they have served as an obstacle for potential teachers from ethnically and racially diverse backgrounds (Irvine, 2003). Despite debates, however, it is clear is that ensuring teachers’ knowledge of subject matter is non-negotiable, although the amount of content preparation and the manner in which that knowledge ought to be evaluated remain points of contention.

An increasing numbers of states also now require that teachers show command of subject matter within the contexts of other variables that are critical to teaching such as human development, professional growth, and teacher leadership to name a few. In the state of California, for example, teachers are required to show competence according to the California Teaching Performance Expectations (TPE). Designed to improve teacher quality in California classrooms TPE are centered in the belief that effective teacher competence takes numerous years to develop and is an ongoing process. The TPE were designed as a set of outcomes specifically for pre-service teachers and intended to address multiple and overlapping knowledge and skills in domains such as pedagogical knowledge, personal growth, and the needs of English Language Learners. In short, these principles are intended to represent the core knowledge base that beginning teachers must have as they take on the demanding and complex challenges of California classrooms.

The assessment of subject matter knowledge is not limited to individual state frameworks but is also present at the national level. Since its inception more than 12 years ago, the National Board for Professional Teaching Standards (NBPTS) has sought to advance the quality of teaching and learning in U.S. schools through a rigorous certification process. The NBPTS requires teachers to show mastery and integration of content and pedagogical knowledge. It also requires teachers to possess a repertoire of instructional strategies to help all students meet high standards (NBPTS, 2001). Intended as the teaching profession’s highest credential, National Board Certification is based on five core propositions in relation to which teachers must show evidence of mastery by submitting a portfolio. The propositions are as follows:

1. Teachers are committed to students and their learning.
2. Teachers know the subjects they teach and how to teach those subjects to students.
3. Teachers are responsible for managing and monitoring student learning.
4. Teachers think systemically about their practice and learn from experience.
5. Teachers are members of learning communities.

The NBPTS has provided an important mechanism to establish what would be considered exemplary teaching standards across all areas and has gained increased prominence over the past decade as a set of standards that define excellence in the field. Moreover, the emphasis on having teachers demonstrate command of subject matter in a manner that contributes to student learning is an essential part of teacher capacity. However, some researchers have called into question the equity and cultural assumptions implicit in National Board Certification, arguing that the disproportionate numbers of teachers of color who fail to certify may reflect a major flaw with the process.
Ladson-Billings and Darling-Hammond (2000), for example, contend that culturally responsive teaching practices may not be consistent with the measures used by the National Board. In their research, they examined the practices of successful teachers in urban schools and argued that the characteristics of these teachers were not well represented, specifically in the National Board Early Adolescent/English Arts assessment. They also argued that the National Board for Professional Teaching Standards assessments have an adverse impact with respect to race, meaning that teachers of color and teachers in urban schools certify at significantly lower rates than White teachers and teachers in more affluent schools. Therefore, while the NBPTS offers important promise for recognizing the highest standard of teaching, consideration must be given to further evaluation of its ability to capture commendable teaching in all of its manifestations.

PEDAGOGICAL CONTENT KNOWLEDGE

Any discussion of fundamental capacity or essential knowledge for teachers should pay careful consideration to the importance of how content is delivered or made accessible to learners. During the early part of the twentieth century, the issue of pedagogy became increasingly common in discussions of teacher training and was considered an important attribute of teacher capacity. Shulman (1986) helped to advance the thinking on pedagogical content knowledge by stating that:

The most regularly taught topics in one’s subject area, the most useful forms of representations of those ideas, the most powerful analogies, illustrations, examples, explanations, and demonstrations, in a word, ways of representing and formulating the subject that make it comprehensible to others. Pedagogical content knowledge also includes an understanding of what makes the learning of specific topics easy or difficult; the conceptions and preconceptions that students of different ages and backgrounds bring with them to the learning of those most frequently taught topics and lessons.

Shulman’s notion of pedagogical content knowledge was predicated on his contention that subject matter and pedagogy were too often treated as two different domains. He suggested instead that the intersection of the two concepts provided a clear blending of how subject matter content and concepts within it could be organized in a manner that make them accessible to learners. Although, Shulman dramatically influenced thinking in the field regarding pedagogical content knowledge, he was not the first to discuss the importance of the role of pedagogy in teaching. John Dewey (1897) suggested that the educational process should be looked at as a complex endeavor which required knowledge and understanding of multiple domains of teaching and learning. He asserted that the educational process “has two sides—one psychological and one sociological; and that neither can be subordinated to the other or neglected without evil results following” (p.78). Drawing on Dewey’s and/or Shulman’s ideas, teacher educators across the nation have restructured training programs to emphasize the role of pedagogy and pedagogical content knowledge in teacher capacity. Some have suggested, however, that the shift to pedagogical content knowledge has come at the expense of the necessary emphasis on content knowledge (Ball & McDiarmid, 1990).

Teaching is a highly complex activity, which requires intellectual sophistication in a
The concept of pedagogical content knowledge has been widely cited in the professional literature on essential knowledge for teachers in training (Grossman, 1990; Ma, 1999; Shulman, 1987; Wilson et al., 1987). The manner in which pedagogical content knowledge intersects with subject matter areas varies across disciplines. Wineburg & Wilson (1988), for example, found that social studies teachers’ disciplinary backgrounds significantly influenced the manner in which they represented historical knowledge for high school students. Grossman (1990) reached similar conclusions with regard to the preparation of English teachers, particularly that with regard to teachers’ pedagogical approaches to literature influenced the manner in which textbooks were utilized. Our point in this chapter is that conceptions of teacher capacity for diverse learners must include continued attention to pedagogical content knowledge. In particular, we suggest that a notion of pedagogy must recognize complexity in students’ learning, especially with regard to background knowledge and individual culture.

PEDAGOGY, LEARNING, AND CULTURE: THEORIES OF SITUATED COGNITION

While we have learned much from the research on pedagogical content knowledge, we maintain that teacher capacity for diverse learners can be enhanced by the intersection of pedagogical content knowledge along with a complex notion of culture and learning. This intersection is necessary because it helps to provide insight about the type of knowledge that can be useful in teaching diverse learners. Some scholars have suggested that the importance of pedagogy is largely tied to an understanding of the cultural context in which students learn and grow, thus the importance of human development and cultural context is essential (Cole, 1996, 2000; Erickson, 2002; Gutiérrez, 2002). Further development of a model to establish a meaningful knowledge base about teacher capacity should be cognizant of the connection between pedagogy, culture, and cognition.

A plethora of research has examined the manner in which human development influences student cognition (Gutiérrez & Rogoff, 2003; Gutiérrez et al., 2000). In light of increasing student diversity in schools, sociocultural theory has gained increased prominence in teacher training, and we would argue that this should be a fundamental part of conceptualizations of teacher capacity for teaching diverse learners. Drawing heavily on the works of Vygotsky (1986), sociocultural theories purport that children’s development cannot be understood simply by studying the individual, but that development must be understood within the participation of activities that require cognitive and communicative functions. This type of situated learning draws attention to learning and how it occurs in authentic situations (Brown et al., 1996). Another domain of the sociocultural paradigm, cultural historical theory, asserts that the process of learning requires the use of signs, symbols, and other cultural tools (e.g. language, skills, knowledge, and beliefs) used by individuals to embody their collective experiences in external forms such as material objects (words, pictures, books, etc.) which is the essence of learning. Teachers who have an understanding of these aspects of student learning and cognition are better equipped to teach students who come from a variety of diverse cultural and linguistic backgrounds.

Sociocultural theorists have posited that a nuanced and complex notion of culture is necessary to understand the culture-pedagogy-cognition connection. They suggest examining culture as a construct that influences cognition, motivation, modes of interaction, means of interaction, and ways of viewing the world. Renaldo (1989) argues that culture...
is pervasive; that it represents a social system of accumulated beliefs, attitudes, habits, values which serve as a response to particular set of circumstances; and that all human conduct is culturally mediated. Understanding student learning from the perspective of sociocultural theory alters notions of teacher capacity in ways that are critical for teaching an increasingly diverse student population. Currently, most descriptions of teacher capacity rely on mainstream learning theories such as behaviorism, information processing, and cognitive constructivism, which fail to take into consideration the influence of culture and environment on thinking and learning (Artiñes et al., 2004).

A number of theorists have discussed how culture shapes student thinking, learning, situated cognition, and the social context of cognition (Rogoff, 1990; Tharp & Gallimore, 1988). These ideas are important for teachers to understand because they move beyond traditional methods of conceptualizing learning and beyond superficial and essentialized notions of student and group culture. Rogoff and Andelillo (2002), for example, talk about the mainstream essentialized view of culture as the “box problem” wherein individuals from various ethnic groups are viewed as highly homogeneous. More comprehensive and complex accounts of culture suggest instead that educators need to understand that students bring diverse cultural and social capital to the classroom that is often drastically different from mainstream norms and worldviews and that differs greatly among members of the same ethnic group.

A growing number of scholars have posited that effective teaching practices must recognize and respect the intricacies of cultural differences in order to be culturally recognizable and socially meaningful. Geneva Gay (2000) suggests that culturally responsive pedagogy recognizes the uniqueness of students’ culture by using “the cultural knowledge, prior experiences, frames of reference, and performance styles of ethnically diverse students to make learning more relevant to and effective for them. It teaches to and through strengths of these students. It is culturally validating and affirming” (p. 29). Ladson-Billings describes the concept as one that “empowers students intellectually, socially, emotionally, and politically by using cultural referents to impart knowledge, skills, and attitudes,” (p. 18).

Research on pedagogy will continue to inform the discourse on teacher capacity. From the perspectives of advocates of pedagogical content knowledge, the discourse about teacher capacity must be informed by reliable research and empirical evidence which helps to shed light on how teacher educators can effectively teach the skills and knowledge around pedagogical knowledge to pre-service teachers.

TEACHER CAPACITY AND KNOWLEDGE OF EFFECTIVE PRACTICE FOR TEACHING IN DIVERSE SETTINGS

Multicultural education emerged in the 1980s in an attempt to provide teachers with the necessary knowledge and skills to teach diverse learners. Among its aims were to interrupt the cycle of hegemony, inequality, and oppression that results in lack of achievement among students of diverse backgrounds (Banks, 2002). Multicultural education was conceptualized as a reform movement that should be infused throughout school curriculum and policy, pedagogical strategies, and school culture that embraces the homes and communities of all children to create an equitable educational system so that all children may become knowledgeable, caring, reflective, and active citizens in a global and multicultural society (Banks, 2002, 2004; Bennett, 2003; Sleeter & Grant, 2003).

Multicultural educators would argue that any attempt to construct a knowledge base for classroom teachers should recognize the important roles that race, culture, language,
gender, and class currently play in the United States. Moreover, multicultural teacher educators would argue that teachers must teach with what Jackie Irvine (2003) refers to as “the cultural eye,” wherein teachers view their world and the work that they do through a cultural lens that allows them to be change agents in the academic performance of culturally diverse students.

Banks’ (2002) five dimensions of multicultural education attempt to move the field from one centered primarily on content infusion to a more comprehensive and complex area of study. Each of Banks’ (1995) dimensions—content integration, knowledge construction, equity pedagogy, prejudice reduction, and empowering school culture—are viewed as a starting point to look at the breadth and depth of multicultural education theory and practice particularly in teacher education, and can be a core feature of teacher capacity for diverse learners. While some may critique Banks’ model as not being radical or reconstructive enough (Kanpol & McLaren, 1995; Obidah, 2000), there are other multicultural scholars who also take a holistic approach to reforming the educational process to reflect diversity, address curriculum concerns, and question institutional discrimination with the intent of improving academic achievement for all students such as Sonia Nieto (2004) in her list of “multicultural is” and Bennett’s (2003) “core values and goals” of multicultural education.

Based on an extensive review of the multicultural literature, Cochran-Smith (2003) offered a “conceptual structure [for] interrogating the multiple meanings of multicultural teacher education” (p. 8). Her framework includes eight penetrating questions such as investigating the complexity of student diversity, examining the purpose of schooling, assessing which knowledge is most useful, evaluating the importance of teacher outcomes, and continuing to document best practices. Cochran-Smith recommends that a more comprehensive and complex understanding of multicultural teacher education can inform teacher practice, and also recognizes the salience of research for policy regarding ways to recruit, retain, prepare, support, and assess high quality teachers for multicultural schools.

A plethora of empirical research has contributed to the knowledge base on effective teaching practices to improve the school performance for diverse learners. Au and Jordan (1981), for example, conducted a case study of the Kamehameha Early Education Program (KEEP), a language arts development project, to examine how a team of teachers, psychologists, anthropologists, and linguists devised methods to teach native Hawaiian children to read. Au and Jordan found KEEP’s method of reading instruction to be successful because greater emphasis was placed on comprehension as opposed to sound-symbol relationships. In addition, reading instruction was organized into a system of learning centers, which made instruction more individualized. However, Au and Jordan attributed the majority of KEEP’s success to the similarities between how the reading lessons were conducted and the linguistic patterns frequently found in native Hawaiian culture, namely “talk-story.”

Lee (1995) examined the efficacy of signifying, a form of social discourse in the African American community, as a scaffold for teaching skills in literary interpretation. She hypothesized that teachers who demonstrated the ability to signify and had prior knowledge about social discourse, values, and themes on which instructional texts were based would positively influence the ability of African American students to interpret fiction. Lee (1995) explained student improvement in terms of schema theory, which asserts that when analogies are used to connect unfamiliar information with existing schemata, unfamiliar information is placed within a recognizable context. This familiarity often leads to better comprehension and high mastery of skills (Collins et al., 1991; Resnick, 1987). Lee concluded that there is a need to further analyze classroom environments
wherein teachers create learning strategies out of metacognitive experiences involving the analysis of culturally specific texts and culturally familiar experiences.

In an effort to examine the schooling experiences of Puerto Rican girls, Rolon-Dow (2005) used “critical care praxis” as a conceptual framework to examine how teachers connected with students. They found that teachers who had a historical understanding of students’ lives were able to translate race conscious orientations into pedagogical benefits and use counter narratives to create more intimate caring connections between themselves and the communities in which their students lived. These findings were similar to what Valenzuela (1999) found in her work with Mexican immigrant and U.S. born students. She discovered that when there was “authentic caring”—wherein students’ cultural capital was affirmed and validated by teachers—the students were more engaged and willing to assert effort to be academically successful. This was in stark contrast to teachers who used “subtractive” methods of teaching which frequently ignored students’ cultural and social capital.

Nasir (2002) found that the relationship between identity and schooling was integral to mathematics proficiency for African American adolescents. Building on the students’ knowledge of dominoes, Nasir found that in practices such as games of dominoes, mathematical goals arose in the context of activity wherein math concepts became a normalized and mandatory part of particular activity. Nasir (2000) found similar types of connections between culture and learning when she explored how basketball afforded different levels of engagement of statistical thinking and reasoning for African American males. Nasir suggests that when students’ cultural experiences and contributions were not recognized as valuable parts of the learning process, students often assumed that their poor performance was a result of race-based failure. Thus, she makes an important call for linking classroom-learning goals with essential learning goals.

A number of other scholars have offered frameworks for the preparation of teachers for work in diverse school settings. Nieto (2000) has articulated three key factors that teacher education programs must consider if they are to seriously prepare teacher education students for diverse classrooms, (1) take a stand of social justice and diversity, (2) make social justice ubiquitous in teacher education and (3) promote teaching as a lifelong journey of transformation. Each of these areas serve as a challenge to teacher education programs to probe the manner in which they seek to have candidates think about beliefs, attitudes, and knowledge that they have about diverse learners. The works done by the aforementioned scholars offers important conceptual and empirical works that can inform the reconceptualization of teacher capacity for diverse learners. However, we maintain that the use of the models from the multicultural paradigm must be equipped with a set of dispositions, beliefs, and commitments to equity in schools which we address as part of critical consciousness.

CRITICAL CONSCIOUSNESS AND REFLECTION

While much of the research on teacher capacity has centered on professional aspects of teaching such as subject matter knowledge, pedagogy, and cognition, more recent attention has been given to the political values and beliefs and to the importance of teachers’ critical consciousness about the social and political contexts of society and education. Moll & Arnot-Hopffer (2004), for example, talk about the need for teachers to have “ideological clarity,” about the work they do, and to recognize that teaching is always a political endeavor. They stress that ideological clarity requires teachers to have an awareness of the cultural capital that students bring to the classroom and know how to take
advantage of the rich array of cultural, social, and community resources at their disposal within the classrooms and communities they teach. The idea here is that when teachers foster positive teacher-student and teacher-family relationships, there is a much better opportunity to understand how to structure learning situations without requiring students to relinquish their cultural integrity in pursuit of academic success. Villegas and Lucas (2003) call for teachers to acquire “sociocultural consciousness,” which means recognizing that people’s ways of thinking are significantly influenced by race, class, gender, and language, and the hierarchical social systems in which they are located.

Much of the discourse on critical consciousness emerges from the concept of critical pedagogy, and critical educational theorists in particular. Critical educational theorists clearly advocate that teachers must first understand that schools are—“agencies of social legitimation” (Anyon, 1988). Moreover, they assert that schools are spaces where social hierarchies and social practices are reified through curriculum, policy, pedagogy, daily interactions, and discipline. Because all school practices are embedded in these larger institutional social structures, many critical theorists see educational institutions as prime contributors to ideological hegemony (Anyon, 1988; Giroux, 1988; Macedo, 2000; McLaren, 2003a; McCarthy & Crichlow, 1997). It is the ideological structure of institutional hegemony that allows social prejudice and deficit thinking to flourish uncontested in schools, thus institutionalizing the failure of working-class students and students of color (Hatcher & Troyna, 1993).

We posit that these critical works should be definitions of teacher capacity for diverse learners. Critical educational theorists differ from many multicultural education scholars in that they do not see individual prejudice or ignorance as the problem in education, but rather that it is the systemic institutionalization of such prejudice which allows it to remain hidden and thriving. Looking at schools through the lens of political structure necessitates that teachers understand their role in such a structure (Bell et al., 2003; hooks, 1994). Given the widespread complexity of how education is delivered in the twenty-first century, it can be argued that pre-service teachers need to examine their perspectives on schooling and ideology because these frameworks may play useful roles in the overall knowledge base that pre-service teachers develop.

Reflection as part of critical consciousness

A central part of teacher capacity is examining one’s own ideas and how these influence the work of teachers. A number of scholars have provided frameworks for thinking about how to engage pre-service teachers in this important reflection (Milner, 2003; Howard, 2003). A critical consciousness would take teacher’s hegemonic thinking to task, and require them to reflect on the effects of their practice on the students they teach. This means that the preparation of critical educators begins with “consciousness” about their role in the institution and their ability to see themselves as agents of change. “To insist that teachers recognize the political nature of their own work can be understood as part of a broader critical effort to make them self-reflective of the interests and assumptions that shape their classroom practices” (Giroux, 1994, p 36). Parker (1987) states that one of our goals as educators is to help students develop “critical habits of mind” in which they judge whether conclusions are supported by sufficient evidence, including investigation of the accuracy of historical events as they have traditionally been told.

It is the inclusion of social and political consciousness in teacher preparation that unnerves many critics of teacher education, who argue that teacher preparation should be devoid of politics, and soft pedagogy, and should be steeped in rigorous subject matter (Ravitch, 2000; Schlesinger, 1991). From a critical pedagogy approach, teachers play the
role of facilitators of discussion and critical dialogue. They do not seek to provide students with “right” answers, but push them to collect information to support their beliefs. However, Freire (1989) advises teachers to be knowledgeable in their field and to apply a challenging curriculum. Engaging in “problem posing” education, does not imply that there is a lack of rigor or that content knowledge is not being obtained by the students. Instead, students are receiving a quality education that also includes “humanizing pedagogy” where teachers and student dialogically engage in discovering and transforming their world. Does knowledge about the politics of education infer that teachers should be trained in certain types of pedagogy? Critical pedagogy seeks to counter what Bartolomé (2003) calls the “methods fetish.” According to Bartolomé it matters not what type of methods teachers engage in as long as the goal is the same—to empower marginalized students. Thus, “the actual strengths of methods depend, first and foremost, on the degree to which they embrace a humanizing pedagogy” (p. 425).

Teachers who have a critical or problem posing approach to teaching engage students in the spirit of critical inquiry on an ongoing basis. Coincidentally, in standards related to teaching in each of the primary content areas, teachers are encouraged to promote and teach inquiry based skills tied to specific content areas. Freire’s problem posing begins with the curiosity of the learner; critical inquiry entails not only asking questions, but investigating potential solutions, creating new knowledge, seeking an understanding of various phenomenon, discussing discoveries and experiences, and then engaging in reflection and application of new found knowledge. Today’s teachers should have the capacity to challenge students to question the world around them, including issues in their communities, topics in the nation, problems in the world, and problematizing ways to identify interventions for these occurrences.

TEACHER CAPACITY: IMPLICATIONS FOR RESEARCH AND PRACTICE

How teacher preparation will continue to evolve is unclear on multiple levels. Regardless, teachers will continue to enter classrooms with unprecedented ethnic, racial, linguistic, and social class diversity. We suggested at the outset of this chapter that historically teacher capacity has been narrowly defined in terms of core knowledge and skills, without careful consideration to diverse populations. McDiarmid and Clevenger-Bright (in this volume, Chapter 9) argue that enhancing teacher capacity is contingent upon a number of factors such as technology, policy, and changing demographics. To that end, we posit the need for research that examines whether and how teachers who are equipped with the capacities we have outlined are influencing learning for diverse students. Teacher education practitioners and researchers must be equally committed to, on one hand, creating and examining programs designed to ensure that teachers entering classrooms with the capacity to teach in today’s diverse learning communities, and, on the other, to documenting how student learning is improved when teachers have these capacities.

It is imperative for teacher education researchers to concern themselves with establishing a “culture of evidence” which documents, when, where, and how teacher education programs are making an impact on teacher quality and student learning. Cochran-Smith and Zeichner (2005) argue that we need “studies from differing paradigmatic and epistemological perspectives that examine the links between . . . teacher preparation context for learning, what teacher candidates actually learn, how their learning is played out in practice in K-12 schools and classrooms, and how this influences pupils’ learning” (p. 2).
It is absolutely essential that researchers produce evidence that speaks to the best and most effective means to prepare teachers for diverse school settings. Furthermore, teacher educators must remain mindful of the politics of debate about how to prepare high quality teachers to teach in diverse schools—particularly in light of persistent low performance in low-income, culturally diverse school settings. Therefore, it is essential that not only the technical knowledge base be established to prepare teachers, but also that a political infrastructure be developed that recognizes the difficulty of articulating the manner in which most teachers are prepared in this country, and a structure that can withstand the large scale attacks on the profession.

We offer three considerations that we believe can inform the future direction, research and thinking regarding teacher capacity for diverse learners in a manner that speaks directly from the research base on teacher preparation.

1. Given the type of scrutiny that has been given to multicultural interventions for teacher capacity, we call for more empirical research on the correlation between multicultural concepts, content, and paradigms and student learning. Questions to be considered might entail: how does mathematics content situated in a multicultural framework influence students’ math proficiency? Or, what are the academic outcomes of students who are placed in classrooms where teachers utilize culturally responsive teaching practices? What do curriculum design and pedagogical practices look like for teachers who employ a critical consciousness in their teaching? How do low performing readers respond to a critical pedagogy orientation? The answers to these questions are vital to the continued push to expand the paradigm of teacher capacity for diverse learners. Extensive systematic research on what is working and what is inadequate in the training of teachers for diverse school settings is crucial to ensure that the attributes of teacher capacity remain informed by current research, the latest policy initiatives, and reliable data on student demographics and learning outcomes.

2. Much of the argument about revising teaching capacity for diverse learners has implications for teacher education programs. Therefore, future research should also investigate the effectiveness of teachers who come from more social justice oriented programs. A growing number of programs have made explicit mention of their programs being dedicated to the implementation of social justice theory and practice. Teacher capacity for diverse learners can be fortified by taking note of the practices, coursework, theory, and ongoing supervision given to teachers who attend such programs. And ask pointed questions such as: are these teachers better prepared to teach diverse learners? Do they remain in hard-to-staff schools longer? Ongoing research with these programs can investigate the manner of how students achieve with teachers from these programs. Indices do not have to be restricted to test scores, but could include indices such as graduation rates, attendance, college enrollment, grade point average, behavioral issues, and overall student engagement in course material.

3. The documentation of best practices will continue to be instrumental in teacher capacity for diverse learners. While a necessary component of teacher capacity is centered on what teachers need to know, more attention should be placed on what they do in classrooms. In particular, when teaching practices seem to be contributing to the academic success of diverse learners, they should be assessed for potential replication. While many novice teachers are equipped with sound theoretical knowledge of subject matter, pedagogy, and critical consciousness, the transfer of that knowledge into meaningful teaching practices is frequently an insurmountable
obstacle. Further examination and documentation of best practices can serve as useful models to help provide novice and experienced teachers with the type of capacity that can contribute to their effectiveness of teachers in diverse classrooms.

CONCLUSION

One of the biggest challenges we face in helping to redefine teacher capacity in a manner that is reflective of the needs of diverse learners is to assess the moral, political, and professional will of those involved in teacher development to do what is right for today’s student population. The importance of rethinking teacher capacity for diverse learners is underscored by the persistent and disproportionate academic underachievement of scores of culturally diverse and low-income students. The need to rethink teacher capacity is essential because recent data from student academic outcomes informs us that many of the attributes of current teacher capacity are falling terribly short in helping all students learn. Moreover, in an era of increased accountability, high stakes testing, and decreased funding for schools it is absolutely essential for teachers to be the best that they can be in all facets of their work—their students deserve nothing short. While we make a call for additional research and analysis of what teachers should know and do to reach all learners, we already have at our disposal a multitude of evidence which provides educators with information of what does work, what does not, and how to transform various aspects of teaching and learning. We cannot afford to ignore these worthwhile and informative contributions.

We conclude with the point with which we began. How we think about teacher capacity—their knowledge, skills and dispositions—must be informed by the complexities of the changing demographics of the students they are teaching. This has major implications for how we think and care about young people in a diverse society and how we view equity, justice, and students’ opportunities. It is our hope that the preceding discussion will inform ongoing empirical research, analysis, and dissemination of information about how we can establish a comprehensive and critical conception of teacher capacity for teaching diverse learners. The gravity of this challenge is underscored by the millions of school children who depend on educators to help them reach their full potential in every aspect of their development as citizens. Not only does this have ramifications for the work that we do as educators, but it has consequential effects on the very fabric of our democracy and the greater global community as well.

National Board for Professional Teaching Standards (2001) Report on issues referred to the working groups by the Equal Opportunity Coordinating Committee (EOCC), Arlington, VA.

INTRODUCTION

Education is “the great equalizer of the conditions of man,” declared Horace Mann, in his annual report to the Massachusetts State Board of Education in 1848 (Cremin, 1957). Mann, who became known as the father of the American common school, believed public education could be transformed into a powerful instrument for social unity by providing all children with a common set of values and skills.

More than 150 years later, Mann’s vision of education as an equalizer has not been realized in the United States, despite the multitude of federal, state, and local policies devoted to achieving this goal. Today in a nation where power and privilege in our society remain stratified by race, gender, and socio-economic status, we are engaged in an ongoing debate about what constitutes educational policies based on equality, equity or social justice.

In this chapter we discuss social justice and teacher capacity, an amalgam of teachers’ knowledge, skills and dispositions, by posing and answering three questions. How should education professionals define the concept of social justice? What is the relationship between teacher capacity and social justice? What are teacher educators doing in scholarship and practice to bring about social justice? Our purpose is to provide teacher educators with an overview of the concepts of social justice and teacher capacity, so they may understand the relationship between the two and consider how well they are contributing to Horace Mann’s vision of education as the “great equalizer.”

We draw on literature from the field of teacher education, but also borrow from the literature of moral and political philosophy as well as social policy. In addition, we examine a particular body of teacher education literature—articles from four journals that focus on social justice over the past three decades—in order to identify the characteristic practices associated with social justice efforts in education.

The chapter is organized around three major ideas each of which are presented in the following three sections: (1) an overview of the history and evolution of the concept of social justice; (2) an examination of the relationship between teacher capacity and the implementation of social justice; and (3) a review of the literature from four journals to examine how educators are currently attempting to implement social justice.

AN OVERVIEW OF THE HISTORY AND EVOLUTION OF THE CONCEPT OF SOCIAL JUSTICE

The term social justice was first used by Luigi Taparelli d’Azeglio, an Italian Catholic scholar, in his *Theoretical Treatise on Natural Right Based on Fact*, published during the
period from 1840–1843. However, it was John Stuart Mill who, according to Michael Novak (2000), gave this “anthropomorphic approach to social questions almost canonical status for modern thinkers” when, in 1863, he wrote in *Utilitarianism* that:

Society should treat all equally well who have deserved equally well of it, that is, who have deserved equally well absolutely. This is the highest abstract standard of social and distributive justice; towards which all institutions, and the efforts of all virtuous citizens, should be made in the utmost degree to converge.

Although Mill’s ideas about social justice held sway for decades, in the aftermath of World War II, scholars began to re-examine the concept of social justice. This came after it was apparent that Mills’ ideas about “the greatest good for the greatest number” could be twisted or abused to lead to a “tyranny of the majority” such as Nazi Germany’s mistreatment of the Jews and the United States’ mistreatment of African Americans. One of the most important and influential modern examinations of the concept of social justice is John Rawls’ *A Theory of Justice* (1971), which is credited with re-awakening an interest in political philosophy in the United States.

Rawls (1971) writes that, “Justice is the first virtue of social institutions, as truth is of systems of thought.” He asserts that, “Each person possesses an inviolability founded on justice that even the welfare of society as a whole cannot override” (p. 3). Writing about the enduring significance of Rawls’ work, Martha Nussbaum (2001) asserts that:

The intuitive idea from which Rawls’s theory starts is simple and profound: “Each person possesses an inviolability founded on justice that even the welfare of society as a whole cannot override.” In other words, the pursuit of a greater social good should not make us mar the lives of individuals by abridging their basic rights and entitlements. In particular, Rawls is concerned with the many ways in which attributes that have no moral worth—like class, race, and sex—frequently deform people’s prospects in life. Even if racism and sexism could be shown to maximize social utility, he says, they would still violate our basic sense of fairness.

(p. 3)
force in reshaping the philosophy, implementation, and practice of social justice in the United States. Events such as the following propelled the Civil Rights Movement:

- The brutal death of Emmett Till in Mississippi in August 1955, and the acquittal by an all-White jury of the two men who were arrested for the murder and who subsequently boasted about committing the murder in a Look magazine interview.
- Rosa Parks’ decision on December 1, 1955 not to surrender her seat to a White man on the Montgomery bus. This led to a boycott which did not end until the buses were desegregated more than a year later.
- President Eisenhower’s decision to send in federal troops to intervene on behalf of the students who were trying to integrate Little Rock High School.
- The 1965 Selma-to-Montgomery march for voting rights.

The Civil Rights Movement of the 1960s was followed by the second wave of the feminist movement, Chicano and American Indian movements, the Individuals with Disabilities Educational Act and movement, and the gay rights movement, all of which sought increased social justice. For example, the feminist movement of the 1970s, like the Civil Rights Movement of the 1960s included actions for social justice at the federal, state and local levels in such areas as employment and education.

Since the publication of A Theory of Justice, there has been an ongoing debate and discussion about the meaning of social justice. In his article “Defining Social Justice” Michael Novak takes note of the work of British born economist and political philosopher Friedrich Hayek’s assertion that social justice is a mirage:

Hayek points out that whole books and treatises have been written about social justice without ever offering a definition of it. It is allowed to float in the air as if everyone will recognize an instance of it when it appears.

(Novak, 2000, p. 11)

Novak continues his observations about the difficulty of defining social justice by further reference to Hayek’s assertions that social justice is a mirage:

Hayek points out another defect of twentieth-century theories of social justice. Most authors assert that they use it to designate a virtue (a moral virtue, by their account). But most of the descriptions they attach to it appertain to impersonal states of affairs: high unemployment, or inequality of incomes or lack of a living wage are cited as instances of social injustice. Hayek goes to the heart of the matter: social justice is either a virtue or it is not. If it is, it can properly be ascribed only to the reflective and deliberate acts of individual persons. Most who use the term, however, ascribe it not to individuals but to social systems. They use “social justice” to denote a regulative principle of order; again, their focus is not virtue but power.

Goodlad (2002) is among a number of scholars (e.g. North, in press; Sturman, 1997) who contend that social justice is a contested and normative concept and that theorists and policymakers use the term to mean different things (e.g. equal opportunity, equity). Bell (1997), for example, defines social justice as both a process and a goal. The goal of social justice is full participation of all groups in a society that is mutually shaped to meet their needs. Social justice includes “a vision of society . . . [where] members are physically and psychologically safe and secure” (p. 3).

Barry (2005) argues that “social justice is, and is normally understood to be, a question
of equal opportunities” (p. 7). In addition, he contends, “Social justice is about the treatment of inequalities of all kinds” (p. 10). Smith’s (1994) argument about social justice, while somewhat similar to Barry’s, employs the concept of fairness and equity. In addition, Smith is concerned with both fairness in the distribution of outcomes and how distributive injustices come about:

The term social justice is taken to embrace both fairness and equity in the distribution of a wide range of attributes, which need not be confined to material things. Although the primary focus is on attributes, which have an immediate bearing on people’s well-being or the quality of their lives, our conception of social justice goes beyond patterns of distribution, general and spatial, to incorporate attributes relevant to how these come about. While fairness is sometimes applied to procedures and justice to outcomes (Barry, 1989), we are concerned with both. Preference for the term social justice rather than justice in general is explained not by preoccupation with the distribution of attributes which might be labeled as social, but by a concern with something which happens socially among people in a society . . . Thus the meaning of socially justice adopted here is simultaneously distributional and relational.

(p. 26)

According to Young (1990), “social justice aims for the elimination of institutionalized domination and oppression” (p. 15). She believes that social justice should facilitate: (1) “developing and exercising one’s capacity and expressing one’s experiences” and (2) “participating in and determining one’s action” (p. 37).

Fraser (1997) introduces the “recognition” of “culturally defined groups” into the social justice discourse and contends that social justice must be defined within a framework that includes both economic redistribution and cultural recognition.

Many actors appear to be moving away from a socialist political imaginary, in which the central problem of justice is redistribution to a “postsocialist” political imaginary, in which the central problem of justice is recognition. With this shift, the most salient social movements are no longer economically defined “classes” who are struggling to defend their “interest,” end “exploitation,” and win “redistribution.” Instead, they are culturally defined “groups” or “communities of value” who are struggling to defend their “identities,” end “cultural domination,” and win “recognition.”

(pp. 8, 9)

TRACING THE RELATIONSHIP BETWEEN SHIFTING DEFINITIONS OF SOCIAL JUSTICE AND THEIR ROLE IN TEACHER EDUCATION AND THE DEVELOPMENT OF TEACHER CAPACITY

Social justice and teacher education

Implicitly and explicitly, the various civil right movements of the 1960s and 1970s raised fundamental questions about teacher capacity and spoke to the necessity of embedding social justice issues within the knowledge, skills, and dispositions of teacher education programs, as well as the scholarship and actions of teacher educators.
Two ideas a reader of the social justice literature may come away with are: (1) changes in society, such as the social inclusion of groups (people of color and other marginalized groups), the Civil Movements, progress toward gender equity, technological advances over the past sixty years continue to affect the ways social justice is defined, policies are written and implemented, and the ways people accept and act on a particular meanings of social justice; and (2) Rawls’ notion of social justice as fairness holds an influential position in social justices discourses and, therefore, may be a useful tool for teacher educators to use as they examine both their scholarship and practice and teacher education program policies and practices.

It is important to locate social justice within the theories that are being used. Theoretical perspectives allow us to ask different questions about social injustices and contribute to a deeper understanding of justice or injustice concerning, for example, the distribution of attributes and resources or the recognition of culturally defined groups. More specifically, for instance, feminist theories, with their attention to how gender plays a role in shaping human consciousness and patriarchy functions within educational systems, ask somewhat different questions from those of post-colonial theories that focus on explaining the role of colonialism in persistent relations of domination and subordination in a multicultural, democratic society.

Since the publication of Rawls’ book in 1971, social justice has been reinterpreted in light of the contemporary theories of equality, participation, and recognition (Miller, p. 2). Arguably, these theories became major criteria for addressing public policy in the 1960s. The passage of the Elementary and Secondary Education Act (ESEA) in 1965, for example, illustrates how these theories informed a political action aimed at correcting a failing education system for poor children. This legislation was based upon the theories of: (1) equality (i.e. equal opportunity); (2) participation (e.g. Latino children enjoying the privileges of public education, where their home language (Spanish) was the language of instruction and bilingual policies were in place to maintain the language); and (3) recognition (e.g. awareness of Asian American, Native American, and African children “as somebody”).

Similarly, theories of equality, participation, and recognition influenced the funding of Head Start programs. Poor students and/or students of color were recognized and given access to an enriched social environment, where they received health and social services and education (Illinois Head Start Association, 2006). Likewise, the 1965 funding of Teacher Corps to prepare teachers for urban and rural schools and to improve home-school relationships was also a social justice act based on theories of equality, participation, and recognition. Teacher Corps recognized parents as a significant stakeholder in the education of their children, and they (parents and care-givers) were encouraged to participate in developing school policy and procedures that affected students in the school community.

Additionally, the reauthorization of ESEA in 2001, also known as No Child Left Behind (NCLB) legitimates this legislation in terms of equality, participation, and recognition. As the authors of NCLB state, “In America, no child should be left behind. Every child should be educated to his or her potential” (p. 3) NCLB is largely aimed at inner city students and is, in theory, supposed to empower parents and bring about an increase in teacher/school accountability for students’ academic performance.

Over the past two decades, teacher educators have increasingly focused attention on how teachers’ knowledge, skills and dispositions relate to social justice. For example, Giroux (1992), Kumashiro (2002), and Cochran-Smith (2003) each describe a different approach, idea or method for integrating social justice into teacher capacity and many of their claims address power and the distribution of resources. Giroux (1992) focuses on

In the early 1990s, Giroux (1992) argued for a pedagogy that would help teachers gain the capacity to teach for social justice:

Learning to teach that is premised on a stance for social justice recognizes the importance of social justice pedagogy. This social justice pedagogy refers to a deliberate attempt to construct authentic conditions through which educators and students can think critically about what stands as knowledge, how knowledge is produced, and how knowledge is transformed by a particular relationship between the self, others, and the larger world.

(p. 99)

Giroux (1992) went on to assert that:

A social justice stance is, in part, a disposition through which teachers reflect upon their own actions and those presented by others. Rather than passively accepting information or embracing a false consciousness, teachers take a much more active role in leading, learning, and reflecting upon their relationship with their practice and the social context in which the practice is situated.

(p. 99)

Kumashiro (2002) advocates “anti-oppressive education,” that is based on four approaches to education. The first approach includes developing education for the Other, by making schools helpful, safe spaces for all students. The second approach is education about the Other. This approach seeks “to enrich all students’ understanding of different ways of being” (p. 42). The third approach, education that is critical of privileging and “othering,” advocates “a critical awareness of oppressive structures and ideologies, and strategies to change them” (p. 45). The fourth approach promotes an education that changes students and society. This approach argues for “curricular and pedagogical reforms that help to address the complexities of anti-oppressive education by developing such notions as partiality, resistance, crisis, and unknowability as they apply to teaching and learning” (p. 68).

Cochran-Smith (2003) argues for a major overhauling of university-based teacher education programs that prepare teachers. She makes a strong case for a new teacher education, one that works both to challenge historical ideological underpinnings of traditional programs and to situate knowledge about culture and racism at the forefront of the teacher education curriculum. Included in this re-imagining of teacher education is teaching for social justice as an imperative and outcome of learning to teach as well as understanding the importance of valuing the cultural knowledge of local communities.

Although attention to social justice has increased over the past two decades, it has been more in name than substance. Zeichner (2006) states, “It has come to the point that the term social justice in teacher education is so commonly used now by colleges and university teacher educators that it is difficult to find a teacher education program in the United States that does not claim to have a program that prepares teachers for social justice” (p. 328). Additionally, he reports that except for greater attention being given to the role of communities in the preparation of teachers most of the work toward social justice in the United States seems to focus on classroom-based activities of individual teacher. Zeichner’s comment suggests that a number of problems and challenges are facing teacher education programs, such as the seriousness with which programs address
the conceptual underpinnings and context of social justice. We need to examine if and how social justice is defined in teacher education programs as well as the conceptual tools being used to assess how well programs are meeting social justice goals.

**Defining teacher capacity in addition to knowledge, skills and dispositions**

Conceptions of teacher capacity that include attention to the dimensions of knowledge, skills, and dispositions are evolving and expanding, as McDiarmid & Clevenger-Bright (this volume) point out. Part of the growing conception of teacher capacity includes the dimension “views of self,” described as “their beliefs about their role in classroom activity, and the persona they adopt in the classroom” (O’Day et al., 1995; CPRE Policy Brief, 1995). All of these dimensions are “interdependent and interactive” (O’Day et al., 1995).

According to the National Council for Accreditation of Teacher Education (NCATE, 2003), teacher capacity involves candidates’ “knowledge, skills, and dispositions.” However, NCATE goes on to link the quality of disposition, to for example, professionalism in working with students, families, and communities. Target performance for the teacher disposition standard involves candidates working “with students, families, and communities in ways that reflect the dispositions expected of professional educators as delineated by the institutions as well as professional and state standards.” Target performance is therefore realized when candidates’ views of self include acknowledging that their own “dispositions may need to be adjusted” and they are able to “develop plans to do so.” Significantly, this performance standard suggests that institutions should define and standardize teacher disposition.

However, NCATE places the onus of delineating the teacher dispositions that “help all students learn” on the unit (college, department, programs), which may be influenced by professional and state standards but not necessarily by theories of social justice. Calling attention to this procedure, Cochran-Smith (2004) declares, “It is not clear . . . whether this emerging professional image also includes images of the teacher as activist, as agent for social change, or as ally in antiracist initiatives” (p. 117). She further argues, “As we construct the outcomes question in teacher education, we need to clarify and interrogate what it means to teach ‘all students’ well and/or what is means to adjust teaching practices according to the needs and interests of ‘all children’ ” (p. 117). Cochran-Smith’s questions go to the core of discussing the relationship between social justice and teacher capacity, and education as “the great equalizer of the conditions of man.”

Although discussions of teacher capacity generally refer to knowledge, skills, and dispositions, Freire (1998) lists other “essential qualities of progressive teachers” (p. 45). He warns that his list, which includes humility, lovingness, courage, tolerance, decisiveness, security, the tension between patience and impatience, verbal parsimony, competence, and the joy of living, is not exhaustive and that these qualities must develop over time. These qualities are less present in the literature where the focus is on teacher capacity without attention to social justice.

**Historical tracing: teacher capacity and social justice**

For years, the explicit and implicit thinking regarding the issue of teacher capacity often centered on the capacity of White teachers to teach White students without much attention to the racism embedded within this thinking. When the question of teacher capacity began to include the teaching of Black students, questions of race (and racism) became more visible.
An earlier formulation of the teacher capacity question was thus, “Can/should White teachers teach Black children; and if so, what are the knowledge, skills, and implicit disposition they have (or need to have) other than the color of their skin?” Mabee (1979) in *Black Education in New York State* argued that there was considerable debate among African Americans in New York throughout most of the nineteenth century over whether Whites should teach in Black schools. A reading of Mabee’s text shows that the enduring question about teacher capacity, in relation to the White Quaker woman who taught the children of Frederick Douglas in Rochester, New York, was one of skin color. In other words, at that time many Whites did not believe that a White person should teach Black children.

Mabee (1979) additionally argues that there was debate over who should teach Black students within the Black community. Here again teacher capacity was related to the color of a teacher’s skin and Whites’ dispositions toward Blacks. Mabee claims that Blacks were by no means united on calls for Black teachers in Black schools. For example, the *Christian Recorder*, a publication of the African Methodist Church, argued that for Blacks’ demands for Black teachers for their children strengthened “the color line,” which was in fact the “death line” for Blacks. Moreover, school officials often believed that Black parents preferred White teachers. In Brooklyn in 1863, when attendance at a Black school dropped, a White school board member declared that it would improve attendance at the school if it had a White teacher because Black parents preferred White teachers. Lending support to this belief, a Black school principal explained that some Black parents thought White teachers would prepare the community for the abolishment of Black schools (p. 95).

Nevertheless, some Blacks were not in favor of White teachers because they believed that White teachers did not have the capacity (i.e. dispositions) to do well by Black students. Mabee (1979) writes:

> Early in the nineteenth century, William Hamilton a Black carpenter argued that White teachers did not expect enough of Black pupils. Hamilton states, “It has been the policy of White men,” he said in an address to Black youths in 1827, “to give you a high opinion of your advancement when you have made but smattering attainments. They know that a little education is necessary for better accomplishing the menial services you are in the habit of performing for them. They do not wish you to be equal with them—much less superior . . . They will take care that you do not rise above mediocrity.”

(Hamilton, quoted in Mabee, 1997, p. 95)

Note that teacher capacity as modeled from Mabee’s book is about White and Black teachers teaching Black students and not about Black teachers teaching White students, which suggests that the answer to the enduring question about what teachers need to know, care about, and be able to do (i.e. knowledge, skills and dispositions) needs to be critiqued for its racist origins.

The skin color of teachers, along with their racialized experience and positionality, was further acknowledged in an observation made by Phillips (1940) when he drew on a 1936 study to argue that the qualification most needed by secondary teachers was social intelligence. However, he also pointed out additional qualifications that African American teachers needed, besides social intelligence. Accordingly, Phillips (1940) suggested that Negro [sic] secondary teachers should possess three additional qualifications: (1) “knowledge of the history of one’s race, and understanding of the problems of one’s racial group”; (2) “keen insight into the current social, economic, and political issues in
relation to the problems peculiar to minority groups, vocational opportunities for one’s group, and a willingness to assume educational leadership”; and (3) full appreciation of “the fact that his [sic] responsibility reaches far beyond the confines of his classroom” (p. 483). The term social intelligence and the additional qualities Phillips lists integrated social consciousness into discussions of teacher capacity.

Since Phillips wrote this piece in 1940, the framing of teacher capacity is no longer explicitly situated within a legally racially segregated society where teachers are predominantly concerned about teaching students of their own racial group and/or teaching minority group students to model the dominant social group. As noted above, the Civil Rights Movements of the 1960s and 1970s spoke to the necessity of embedding social justice issues within the knowledge, skills, and dispositions of teacher education programs, as well as the scholarship and actions of teacher educators. The Civil Rights Movements (1) stimulated the rise of recognition and redistribution theories (Fraser, 1997); (2) played a major role in generating several theories and activities that placed race, class, gender, and other social and political inequities within the teacher capacity discourse; (3) acknowledged that White teachers had a responsibility to teach racially diverse groups of students in a manner that respected and promoted each group’s culture and each student’s self-identity; and (4) advocated that teachers of color accept responsibility for creating “an educational experience powerful and enduring enough to breach the walls of oppression and open pathways to freedom” (Ayers, 1997).

The Civil Rights Movement also generated the reform of curriculum materials so they were more racially inclusive and gender fair and addressed historical inaccuracies and omissions, particularly in terms of teachers’ knowledge of the history and culture of students of color and other marginalized students (Sleeter & Grant, 1991) Additionally, instructional materials were developed that addressed the teaching skills, dispositions, and strategies that teachers needed to successfully teach students of color and other marginalized students (Grant & Sleeter, 2003). In addition to developing a more culturally inclusive and relevant curriculum, consultants and speakers provided teachers with a realistic assessment of the challenges they faced, the knowledge, skills and disposition they needed to have, and the changes that were needed in the education system and within them as individuals.

When writer James Baldwin spoke to a group of 200 New York teachers in 1963, he took a view of teacher capacity that drew on social justice and was set within social justice theories of equality, participation, and recognition. Baldwin began his “Talk to Teachers” by claiming “[We] are living through a very dangerous time.” He then defined how equality, participation and recognition in U.S. society were denied to Blacks:

[ANY NEGRO WHO IS BORN IN THIS COUNTRY AND UNDERGOES THE AMERICAN EDUCATIONAL SYSTEM RUNS THE RISK OF BECOMING SCHIZOPHRENIC. ON THE ONE HAND HE IS BORN IN THE SHADOW OF THE STARS AND STRIPES AND HE IS ASSURED IT REPRESENTS A NATION WHICH HAS NEVER LOST A WAR. HE PLEDGES ALLEGIANCE TO THAT FLAG WHICH GUARANTEES “LIBERTY AND JUSTICE FOR ALL.” HE IS A PART OF A COUNTRY IN WHICH ANYONE CAN BECOME PRESIDENT, AND SO FORTH. BUT ON THE OTHER HAND HE IS ALSO ASSURED BY HIS COUNTRY AND HIS COUNTRYMEN THAT HE HAS NEVER CONTRIBUTED ANYTHING TO CIVILIZATION—THAT HIS PAST IS NOTHING MORE THAN A RECORD OF HUMILIATIONS GLADLY ENDURED.]

(p. 326)

In concluding his remarks, Baldwin declared, “I began by saying that one of the paradoxes of education was that precisely at the point when you begin to develop a conscience, you must find yourself at war with your society. It is your responsibility to
change society if you think of yourself as an educated person” (p. 331). He cautioned the teachers, “[Y]ou will meet the most fantastic, the most brutal, and the most determined resistance” since “what societies really, ideally want is a citizenry which will simply obey the rules of society” (p. 331). Baldwin’s comments about education and society find expression in questions about the kinds of knowledge, skills, dispositions, and views of self that are required to participate in an improved and more desirable form of social life. Notions of teacher capacity need to attend to the same questions.

Baldwin’s metaphor of “a dangerous time” was revisited by Ladson-Billings (1999) when she reminded educators that destabilizing dominant discourses of prospective teachers is “dangerous work” (p. 240). Ladson-Billings’ comment—made 36 years after Baldwin’s scathing commentary—continues to raise questions about both the knowledge, skills and dispositions that participation in an improved and more desirable form of social life requires for groups of people who have historically been marginalized, and the teacher capacity needed to develop those knowledge, skills, and dispositions. The metaphors “dangerous time” and “dangerous work” also call attention to issues of power and privilege, which are the center of the social justice relationship to teacher capacity. Walker (2003) reminds us that a social justice discourse in education needs to allow teacher educators to ascertain how power (e.g. pedagogical and institutional) and resources (e.g. material, opportunity and outcomes) are distributed to individuals and social groups.

**Conceptual tools for the adjudication of actions**

Meaning(s), theories, and understandings of the context of social justice are important, but separately or collectively they are not enough. Scholars such as O’Neil (1996) demand conceptual tools for adjudication of action that include principles/criteria for the construction of institutions and practices and evaluations of those constructions. Regarding the latter, O’Neil (1996) states, “Just institutions and practices provide the specifications for judging the justice of particular acts or decisions” (p. 182).

Similarly, Walker (2003) wants educators to do more than provide a definition of social justice. She argues that educators need conceptual tools that will tell us how well we are doing. Are our actions moving us closer to social justice or further away? As Walker states, “We need a theory of principles of justice which enables us to adjudicate between our actions so that we can say with some confidence this action is more just than that” (p. 169). Using the making of a quilt as a metaphor for actions for social justice, Walker states,

> Patchwork actions, the individual pieces of cloth, however bright and lively, are just bits of cloth. Only when we stitch the piece (our actions) together to make a quilt do the patterns emerge and transform the pieces into something new; we need to know what we are trying to make and to be able to judge whether we have made it well.

(p. 169)

To illustrate her idea of such a conceptual tool, Walker (2003) suggests using Nussbaum’s (2000) “Capabilities Approach.” In *Women and Human Development: The Capabilities Approach*, Nussbaum identities ten capabilities: (1) life; (2) bodily health; (3) bodily integrity; (4) senses, imagination, thought; (5) emotion; (6) practical reason; (7) affiliation; (8) other species; (9) play; and (10) control over one’s environment (pp. 78–80). She claims these capabilities are essential to the flourishing life of an individual but are not limited to the capacity for economic participation. She also focuses on
personal and interpersonal development, as well as wider environmental, political, and social contexts and interactions. Walker (2003) argues that although Nussbaum’s approach offers only one way to assess how well we are doing, it frames education within social justice and serves as a good starting place. Walker (2003) is worth quoting at length at this point:

The attraction for education in the capabilities approach is fivefold. First, its emphasis on the flourishing of each and every person and hence a challenge, for example, to university “drop out” statistics which say nothing useful about individual experiences of higher education, even while glossing over success for many. Secondly, the approach points to what “people are actually able to do and to be” (Nussbaum, 2000, p. 5). As a social practice education is fundamentally about what we learn to be as much as about what knowledge we acquire. It is, above all, a domain of activity requiring thinking and judgment not only about what has been done but as a guide to future action. Thirdly, many if not all, of the ten capabilities advocated by Nussbaum point at least in some way to educational conditions and practices. To which stories of educational practice might we point to show capability development (interruption, disruption, transformation) and capability deformation (reproduction)? Finally, this approach suggests a view of (higher) education as more than education for economic development, and incorporates an implicit view of education both as and for democratic citizenship, and understanding and solidarity under conditions of cultural difference and diversity.

The development of conceptual tools for adjudication of action criteria which can help to determine whether or not program policies acknowledge and tackle lack of recognition, exclusion and the powerlessness associated with race, class, gender, sexuality, disability, language, religion and other cultural and social differences. In other words, teacher educators will need to ask: “Does program policy seek to enhance the life opportunities for teacher education students who are disadvantaged by cultural and economic differences, including any stigma associated with being included in the program because they are from a group of people who are historically, economically and/or socially disadvantaged?”

Pitt (1998) contends that program policies should address the ways education and the disadvantage of not attending and/or earning a university degree are implicated as causes or consequences in social justice. In addition, university policy and procedures should not compound the challenge of receiving a college education and should, instead, facilitate a teacher education program that enhances the life chances for people who are disadvantaged (and come to the university disadvantaged) because of major obstacles in society.

In summary, Pitt (1995) argues that criteria for assessing social justice in teacher education programs should include policies that address structural disadvantages, such as the distribution of education goods like knowledge, skills and dispositions; recognize the ideology underlying the prevailing economic discourse(s) (e.g. market place economy); and acknowledge (i.e. respect and affirm) cultural differences. Further, program policies must indicate who is responsible for seeing that students receive policy entitlements and who and what office are responsible for distributing the resources needed for implementation and executing that implementation.

Not nailing down the evaluation tools for how well a teacher education program is establishing and developing a relationship between social justice and teacher capacity undercuts an analysis and interpretation of the two concepts. In addition, the lack of an
evaluation framework may leave teacher candidates and teacher educators conflicted about their actions for social justice. For example, many teacher candidates regularly undertake activities in their programs in the name of social justice. However, accountability measures (e.g. high-stake tests) may confuse their understanding of social justice. Here we are reminded of Walker’s (2003) statement, “We need a theory or principles of justice which enables us to adjudicate between our actions so that we can say with some confidence this action is more just than that” (p. 169). When teacher candidates hear citizens who take action for certain social and political causes (e.g. immigration, homelessness, poverty) refer to their genre of work as “social justice,” will they understand social justice and its relationship to teacher capacity differently or more fully? Will teacher candidates’ understanding of social justice be related to equality, participation, recognition and/or access? When some less well-off and/or non-White students are allowed to enter the teacher education program, but a White, middle-class friend is not admitted, will the teacher candidate and her friends view the admittance of the student from a systemically/historically disadvantaged group as an act of social justice? Will the teacher candidates appeal to a meritocratic argument and become conflicted about the meaning of social justice? In other words, will they see a contradiction between Rawls’ (1971) principles that the most deprived and needy should receive the greater attention and/but that those with talent and potential should be educated to their highest capacity? Will they understand social justice as “the obligation to help those less advantaged” for the benefit of the whole (Rawls, 1971, pp. 100–101)?

Institutions that claim they are using social justice to inform teacher candidates’ knowledge, skills and dispositions must spell out their meaning of social justice, and conceptual tools which will adjudicate the actions of the teacher candidates and teacher educators involved should be in place and functioning.

SPECIAL JUSTICE IN TEACHER EDUCATION: WHAT DO JOURNAL ARTICLES SAY?

Reviewing teacher education journals

One way scholars keep up with the development of their field is by reading the journals in their area. Articles published in refereed journals are not only fundamental to promotion and tenure of professors, they also inform scholars about the history of the field, ongoing changes and emerging concepts, and current problems and issues. Journal publications present the latest research and scholarship in a timely manner. In addition, journal articles serve as curriculum material for both graduate and undergraduate programs. To examine when, how, and to what extent social justice has become associated with teacher education and the preparation of teacher candidates in the United States, we reviewed articles in four teacher education journals: Action in Teacher Education, Equity and Excellence, Journal of Teacher Education, and Teacher Education Quarterly published between 1985 and 2006.

Our review identifies characteristics and/or characteristic practices discussed in the articles that are associated with social justice (teacher) education. In addition, the review explores the meaning assigned to social justice, the theoretical lenses in use, the conceptual tools used to evaluate social justice in teacher education programs, and the context in which social justice is discussed. Our search of the four journals yielded 39 articles published between 1991 and 2005 that used the term “social justice” in their title or abstract. Before the 1990s, education journals published few, if any, articles using the
term social justice in their discussion of teacher education. Social justice began to become popular in the 1990s because, according to North (in press), the highly publicized war over the meaning of terms like multiculturalism, encouraged “educational researchers like Griffith (1998) to intentionally use social justice to describe the subject and methodology of their work.” North goes on to say that Griffiths believed that since “social justice was not appearing frequently in academic or media and popular culture outlets, it had not yet, suffered the kind of attack that more well known terms have” (Griffiths, 1998, p. 85).

In these 39 articles, we note that authors writing about social justice generally do not offer a definition. An exception appears in an article by Carlisle, Jackson, and George (2006) who define social justice education “as the conscious and reflexive blend of content and process intended to enhance equity across multiple social identity groups (e.g. race, class, gender, sexual orientation, ability), foster critical perspectives, and promote social action” (p. 57). The authors outline five principles of social justice education in schools based on their work at an elementary school: Inclusion and Equity; High Expectations; Reciprocal Community Relationships; System Wide Approach; and Direct Social Justice Education and Intervention. They also discuss equity-oriented models that have demonstrated academic outcomes, current research related to student achievement and a systems approach to bringing social justice education to school communities.

In a study of faculty members’ and administrators’ understandings of social justice at Boston College (Zollers et al., 2000), participants met to investigate their shared understandings of social justice. All embraced the goal to teach for social justice. However, they had a range of definitions. The authors noticed that there were divergent categories related to equity and fairness, institutional versus individual understandings of injustice, and individuals’ responsibility to advocate for social justice.

The 39 articles use a range of perspectives to address social justice within teacher education. In addition, while authors are more frequently offering start-up approaches, plans or methods for implementing social justice in teacher education programs, these approaches are not accompanied by benchmarks, staffing needs, and/or conceptual tools for the adjudication of actions. On the other hand, scholars who invoke social justice as central to their scholarship often share a similar vision or perspective and address it similarly. These scholars generally describe social justice as an ethic, concern, sense or orientation. Within these descriptions, a meaning of social justice is sometimes given, and sometimes implied, but is not usually fully articulated. McLaren and Fishchman (1998), for example, refer to an ethic of social justice. According to Murrell (2006), social justice indicates a disposition toward recognizing and eradicating all forms of oppression and differential treatment extant in the practices and policies of institutions, as well as an appeal to participatory democracy as a means of realizing social justice. Garmon (2004) argues that a “sense of social justice is a commitment to equity and equality for all people in society” (p. 206). According to Nieto (2000), a concern for social justice is an ideology and pedagogy which takes into account individuals and institutions. Nieto (2000) argues that teacher education programs need to “(a) take a stand on social justice and diversity, (b) make social justice ubiquitous in teacher education, and (c) promote teaching as a life-long journey of transformation” (p. 182). Nieto also claims that social justice is an individual, collective, and institutional journey that involves self-identity awareness, learning with students, developing meaningful relationships, developing multilingual/multicultural knowledge, challenging racism and other biases, having a critical stance, and working with a community of critical friends (p. 5).

As we reviewed these articles, we come away with the idea that teachers’ “capacities” suggests a kind of “package” of understandings, skills, and commitments (or knowledge,
skills and dispositions)—a much broader notion than just “what do teachers need to know?” or just what “skill” they should have. When social justice is embedded within or connected to teacher capacity, it should include the characteristics that Nieto (2000) articulates and those which emerge in our content analysis of the journal articles. These characteristic practices include: (1) critical pedagogy, (2) community and collaboration, (3) reflection, (4) social (critical) consciousness, (5) social change and change agents, (6) culture and identity and (7) analyses of power.

The role of critical pedagogy
Several articles argued that by using critical pedagogy, teachers and teacher educators are encouraged to understand social justice and/or work toward it. According to Beyer (2001), one reason for advocating critical pedagogy is to “focus on the social dimensions and consequences of educational practice, the ideological meaning of texts and experiences, the power relations in schools and other institutions, and the need to integrate theory and practice in new ways” (p. 155). Nieto (2000) argues that the reason a program should adopt critical pedagogy is to help prospective teachers develop a critical stance to challenge racism and other biases. McLaren and Fischman (1998) state that teacher education programs should be “committed to the development of critical epistemologies, ethics of caring, compassion, and solidarity” (p. 131), strive to heighten students’ understandings of social relations of production, and consider alternatives to existing structural arrangements that are conducive to economic inequality and exploitation.

Although there is an emphasis on critical pedagogy in teacher education programs and professional development within this literature, there is little attention to how teachers translate critical pedagogy into P-12 classroom practice. Ball (2000) recognizes this problem and suggests that researchers attempt to “extrapolate the tenets of critical pedagogy from the interactive classroom practices of those teachers who attempt to operationalize such a philosophy in their day-to-day teaching” (p. 1007). Similarly, Hoffman-Kipp suggests that more attention be paid to the “actual activities in which teachers engage both from a process and content point of view” (p. 28).

Whereas these authors persuasively advocate for the use of “critical pedagogy,” the argument is constructed as a general call and not a call for pedagogy based upon a particular critical theory or combination of critical theories. Critical theories and the pedagogies they foster differ somewhat in purpose and focus. For example, both Black feminist theory and pedagogy and social/radical feminist theory and pedagogy challenge male domination and female oppression. However, Black feminist theory and pedagogy challenge perspectives and practices among White feminists that marginalize or exclude Black women. Black feminist theory has a different purpose and focus than social/radical feminist theory and pedagogy that mainly challenges male supremacy or patriarchy (Welch, 2001). Although most if not all critical theories and pedagogies may be employed in a teacher education program that advocates social justice, what teacher candidates learn or take away from the program may differ in accordance with the theories employed and the pedagogy taught and demonstrated. The intention here is not to advocate for a particular theory and/or pedagogy but to call attention to the differences within the same genre of theories and the pedagogies they foster and to ask, when teacher educators or teacher education programs say our program uses “critical theory,” have they said enough about their purposes and foci and nature of the pedagogy they use?
Community and collaboration

Many of the articles reviewed contend that community and collaboration are as significant to social justice as ideology and practice. Although working with others suggests a general practice, the articles argue that the terms and phrases such as “community of learners,” “communities of practice,” “collective action” and “collaboration” imply solidarity or working together (Cochran-Smith, 2001; Garmon, 2004; Glass & Wong, 2003; Greenman & Dieckmann, 2004; Hoffman-Kipp, 2003; Jennings, 1995; Johnson, 2002; Kurth-Schai, 1991; Lane et al., 2003; McLaren & Farahmandpur, 2001; McLaren & Fischman, 1998; Merryfield, 2001; Morrell, 2003; Moscovici, 2003; Murrell, 2006; Nieto, 2000; Quartz & TEP Research Group, 2003; Rios et al., 1997). According to several articles, a community of practice is a site of learning and action where participants engage in a joint enterprise to develop a whole repertoire of activities, common stories, and ways of speaking and acting for social justice. This endeavor diminishes the borders between community and school, as well as between virtual spaces and physical spaces in education enabling other social arenas to incite new ways of relating and inciting solidarity that is characterized by conviviality and criticality.

Wenger (1998) argues that communities of practice constitute reality in a particular manner and encourages specialized ways of acting and thinking. The community approach to teaching and learning for social justice suggests replacing the image of teachers working alone to images of teachers collaborating with(in) and across communities of practice or communities of learners (broadly defined), thereby challenging the narratives of individual heroism. Addressing the significance of a community of learners or the importance of a team effort in developing pedagogy for social justice, Quartz and the TEP Research group (2003) state:

The real heroes of urban schools are those who figure out ways to stay connected to their profession, their pursuit of social justice, their colleagues, their students, and their communities. These heroes are not born; they emerge from an extensive network of supports and a solid understanding of pedagogy.

(p. 105)

In addition, some of the articles offered suggestions for working together, including joining organizations, working with community members and forming critical friendship circles and/or inquiry groups.

The idea of collaborative support (Weinstein et al., 2004; Luna et al., 2004) figures strongly in these articles. Collaborative support tends to occur in reciprocal relationships that are beneficial and supportive to teachers (Garmon, 2004) and the community or group in which they participate. In Luna et al.’s (2004) article, a participant in an inquiry group describes the concept of “support” as it was experienced in his/her group: “Support in our group had more to do with being listened to, challenged, and validated as we took risks in our classrooms and in our lives” (p. 79). Other collaborative efforts mentioned include capitalizing on parents’ strengths (Cooper, 2003) and participating as members in social movements (McLaren & Fischman, 1998; Hoffman & Kipp, 2003) by linking/connecting individual efforts for change to collective and institutional changes (Nieto, 2000). Merryfield (2001), among others, argues that models and ways of creating communities and collaborating must be continually interrogated, critiqued, and reformed.

Overall, the articles contend that community and collaboration, both of which are
fundamental elements of social change, require collective action in solidarity. Missing from the articles is attention to the effects of unequal power relations in communities and other social networks and how asymmetrical power relations can undermine the struggle for social justice.

The role of reflection

Some articles suggest reflection as a practice for social justice (Lane et al., 2003; Morrell, 2003; Glass & Wong, 2003). Glass and Wong (2003) argue that engaged pedagogy involves continuous critical reflection and professional development, linked to classroom and school-level reform. They contend that the presence of teaching candidates as observers in classrooms forces guiding teachers to critically reflect on their own practice. Similarly, Morrell (2003) reports that conversations between teachers in a professional development research seminar and six other professionals “forced teachers to reflect more fully on their own practice as they witnessed others in action” (p. 95).

However, across most of these articles, reflection is presented as an unproblematic practice that teacher education and professional development programs expect their students to develop. The common assumptions are: reflection will occur through a critical lens that takes social justice concerns into consideration; reflection and subsequent changes in thinking are guided by particular motivations and interests which spawn questions; and reflection influences and is influenced by the processes involved in dialogical teaching, identity and cultural formation, and collaboration.

The role of critical social consciousness

Multiple types of consciousness are discussed across the articles with numerous references to Paulo Freire’s (1970/1974/2000) concept “conscientização.” This represents the development of the awakening of critical awareness, which “must grow out of a critical educational effort based on favorable historical conditions” (Freire, 1974, p. 15). An assumption underlying the call for critical consciousness is that educators who “develop high levels of critical social consciousness are likely to begin their teaching careers attentive to their role in redressing social injustice” (Jennings, 1995, p. 243). Jennings (1995) adds that although this assumption awaits systematic investigation, it has “enough face validity to suggest that the development of critical social consciousness deserves the attention of teacher educators who take seriously the links between affirming diversity and educating for social justice” (p. 243).

Jennings (1995) also examines critical social consciousness through the lens of developmental psychology and argues that “because critical social consciousness involves a developmental process related to identity and cognitive growth, those students who find the examination of oppression threatening must themselves be respected as being in process without being patronized” (p. 248). Jennings therefore suggests that teacher educators have a goal of keeping “resistant students” engaged in the classroom dialogues as part of the process of sensitizing them to issues of social justice and diversity. His reference to dispositions (e.g. sensitizing, resistant) within the context of raising student critical social consciousness integrates teacher capacity and social justice.

Within this literature base, minimum consideration is given to the consciousness of P-12 students. Exceptions include Beyer (2001) who suggests that teachers should use their knowledge of social inequality to raise student consciousness, Glass & Wong (2003) who argue that students should understand that race, class, and linguistic discrimination persists even for the most educated members of their communities, and Ríos et al. (1997)
who argue for a social justice approach at the middle school level that raises students’
consciousness. Ríos et al.’s (1997) argument for a social justice curriculum which takes
students’ lives into account and facilities classroom critique is consistent with the ideas
articulated in the Rethinking Schools article by Bob Peterson (1994): “Teaching for
Social Justice: One Teacher’s Journey.” Peterson lists the following goals of social justice
classroom: a curriculum grounded in the lives of the students, dialogue, a questioning/
problem posing approach, an emphasis on critiquing bias and attitudes, and the teaching
of activism for social justice.

What remains to be examined in this genre of research is the impact that teachers who
exhibit a high level of critical social consciousness have on student performance. Fur-
thermore, the articles that include suggestions for classroom teachers and the develop-
ment of critical social consciousness often fail to include the following characteristics,
suggested in the other articles, that are essential to the preparation of teachers for social
justice education: analysis of power, (self) reflective practice, and collaboration/ community. In addition, this literature does not include discussions of teacher capacity, especially teachers’ knowledge and skills.

Social change and change agents

A thread throughout the articles is the need to reform education so that it becomes a
system that embodies and promotes social justice in all of its components. This reform
effort would be proactive, responsive to change, and demonstrate a commitment to the
struggle for social justice (e.g. Wallace, 2000). A common perspective in this social justice
discourse is that no one is completely outside the social system and that practices and
people are not neutral. Additionally, a prominent claim is that teachers should become
agents for social change or activists. Cochran-Smith (2001), for example, offered the
following statement in an editorial, “Learning to Teach Against the (New) Grain”:

A major goal of the project of teacher education for social change has been helping
prospective teachers think deeply about and deliberately claim the role of educator as
well as activist based on political consciousness and ideological commitment to
combating the inequities of American life.

(p. 3)

An example of a teacher candidate performing as a change agent is illustrated in an article
by Lane et al. (2003). They investigated how the teacher education program at U.C.L.A.-
Center X develops their students as change agents during their student teaching. Student
teachers in the study were given the charge to “reform the schools while learning how to
teach children in urban schools” (p. 65). Lane et al. conclude that student teachers
became change agents by having an impact on the practice of their guiding teachers. This
approach challenges traditional student teacher placements, most of which do not
emphasize the role of the student teacher as an agent for social change.

Another central message in this literature is that social justice includes supporting
students in understanding and transforming their own positions in society and as citizens
in a democracy. Nevertheless, there is little attention given to student agency and, more
specifically, possibilities for students to negotiate the forces that work to regulate their
positionalities and the subsequent material effects of this regulation. Linking position-
ality and agency makes different questions available. For instance, what possibilities
can be created to maintain or access that would improve the quality of life given the
way we are situated within matrices of positionalities by those with the influence to
shape public sentiment and therefore societal perceptions of our gender(s), race(s), sexuality, etc.

McLaren and Farahmandapur (2001) describe agency as “a form of intellectual labor and concrete social practice—in short, a critical praxis” (p. 149). Their discussion includes attention to students in general, not just preservice or inservice teachers as learners, and how the legacies of historical conditions, and not just one’s subjectivity, determine subject positions. They state, “We need to identify the historical determinations of domination and oppression as part of the struggles to develop concrete practices of counter representation” (p. 146). However most of the discussions of teachers as change agents in this body of literature do not relate the idea of change agent to particular knowledge, skills, or dispositions. Moreover, attention to student agency and, more specifically, student resistance is minimal (exceptions are Cooper, 2003; McCall & Andringa, 1997; Pohan & Mathison, 1999).

Culture and identity

Social justice and multicultural education discourses largely overlap in this literature. Perhaps this is so because proponents of multicultural education, especially those who espouse social reconstructionist multicultural education (Martin, 2005; Martin & Van Gunten, 2002; McCall & Andringa, 1997), connect social justice to teacher education and education more generally. Beyer (2001) uses both terms when discussing teachers: “Teachers who embody these orientations [social justice and multicultural education] will intervene in the lives of their students so as to help them construct futures that are personally rewarding, socially responsible, and morally compelling” (p. 156). In a number of articles, social justice is described as a goal of multicultural education (Cochran-Smith, 2003; Rios et al., 1997; Martin & Van Gunten, 2002). Zeichner (2003) argues that multicultural education can function as an approach with similar and overlapping goals of social justice education and, at times, it and diversity are used synonymously in education with the term social justice.

Martin and Van Gunten (2002) suggest that teachers use multicultural education that is social reconstructionist, an approach that shares many of the same concerns as critical theory, to examine their own positionalities. Cooper (2003) supports the idea of “teacher education programs training social justice educators to be knowledgeable about the positionality of the students and families they serve” (p. 102). She adds, “I stress the need for teachers to recognize schools as sites of political resistance, which they must work to improve” (p. 102).

In this strand of literature, there are some salient conversations about diversity and equity that include culture and identity. The argument is that these concepts are intertwined and that our ways of being in the world (including the classroom) are not isolated from how we activate or alter our roles. McLaren and Fischman (1998) argue there is an absence of the “construction of identity” and “critical citizenship” in teacher education discussions and suggest that these absences diminish “the capacity of teacher education programs to participate in the formation of teachers as critical agents of social justice” (p. 125). Three years later, McLaren and Faramandapur (2001) state that “critical pedagogy has, of late, drifted dangerously toward the cultural terrain of identity politics in which class is reduced to an effect rather than understood as a cause” (p. 136). These two articles were indicators of an increase in attention to identity and culture in teacher education reform and the need for teachers, teacher education programs, and professional development to consider how class, identity, and culture influences teacher education. The arguments in these articles have resulted in research studies that examine
how teachers’ identity affects their ability to work toward social justice goals (e.g. Garmon, 2004; Martin & Van Gunten, 2002; Johnson, 2002). However, these articles also introduce a concern that the way identity has been introduced is problematic in that it frequently ignores the need for economic redistribution—not just group recognition—when discussing equality. Fraser (1997) argues that identity politics should not eclipse the need for economic redistribution.

Analyses of power

A few of the articles we reviewed discussed teachers in relation to the effects of power. For three consecutive years, Moscovici (2003) examined how teachers working on emergency permits used inquiry to understand their positions of power, the effect of these power positions on classroom practice, and how they might change their practice as a result of knowledge gained through inquiry. In addition, the teachers in the study were encouraged to examine their own power positions in the classroom using critical theory and concepts of power by Yukl (1989) and Foucault (1979). Moscovici (2003) reports, “As a result of their own personal analyses, many of the teachers in the study changed their practices to encourage their students to participate in scientific inquiries and become skeptics” (p. 47).

The argument made in this literature is that by understanding the effects of power, educators can move from a focus on individual psychological factors to larger societal factors that affect social relations, including the extent to which they can transcend the constraints that impinge on their ability to prepare students for socially-conscious (critical) citizenship. Cooper (2003) points to the significance of teachers’ understanding of the effects of power when she writes, “Educators who do not recognize the power they possess are likely to abuse it or fail to maximize it for their students’ benefit” (p. 104).

DISCUSSION

Several significant observations came out of reviewing the journal articles. We found overlaps and gaps between the key themes and the characteristic practices that we identified in the review. Similarly, we found overlaps and gaps between the characteristic practices and the “principles of practice” of classroom based pedagogy for social justice that Cochran-Smith (1999) outlines (e.g. communities of learning, dialogic and multiculturally sensitive classrooms, knowledge).

In reviewing research between 1992 and 2002, Wiedeman (2002) identified key themes that define teacher education for social justice as: (1) diversity and difference, (2) multicultural education, (3) critical theory, (4) critical multiculturalism, (5) care theory, (6) antiracist education and (7) critical race theory. Identifying the general themes, principles, and/or characteristic practices of social justice in teacher education, classroom contexts, and education contributes to developing a deeper understanding of relationship between teacher capacity and social justice.

Across the articles, there is an emphasis on dialogue as central to the development of communities and an indication of learning, reflection, and social-consciousness. Yet none of the studies we reviewed explain how dialogue is interpreted, or if discourse analysis or some other form of analysis was used to analyze the relationship between dialogue and practice. Often, the studies do not reveal the source of the participants’ statements, such as whether they are excerpted from dialogues generated during interviews or reflections on dialogues recorded in journals. Thus, educators and students have little information
to guide their understanding about how dialogue shaped community building in the context of the studies.

Research focusing on social justice in teacher education may help to redefine teacher capacity by communicating a changing expectation in teacher education, one that can be recognized through the identification, promotion, and integration of these characteristic practices. Together, these characteristic practices support a conceptual orientation that moves teacher educators toward developing their capacity to approach education in ways that integrate social justice theories and practices.

There is a limited amount of empirical research that examines the classroom practices of teachers who claim to work toward social justice and/or the practices of those who were prepared in teacher education programs or professional development programs where social justice is the conceptual orientation (Hollins & Torres-Guzman, 2005). Exceptions to this pattern were Hoffman-Kipp’s (2003) and Moscovici’s (2003) studies. Although, Moscovici reports that teachers’ practice changed after they analyzed their power positions, the author does not provide evidence of this change.

Moreover, because this body of research lacks attention to definition, context, and assessment, it tends to contribute to the gap in the literature on the impact that teacher education for social justice and/or specific characteristic practices have on student performance. Three exceptions are the articles by Murrell (2006) who focuses on the assessment of teacher practice as social justice education; Brown (2004) who reviews measures used to assess preservice leaders’ beliefs, attitudes, and values regarding issues of diversity, social justice and equity; and Carlisle et al. (2006) who focus on the assessment of teacher education programs.

Furthermore, when the qualities associated with teacher capacity are included in social justice discourses, they are usually not central or explicit, but implied or assumed. We wish to note that although we discuss the often cited characteristics associated with social justice literature separately, they overlap and interrelate in the articles. Usually multiple characteristic practices are present, as one might expect given the complexities of learning and teaching. Neither we nor the authors of these articles suggest that these characteristic practices should be developed in isolation from one another, positioned hierarchically in practice or policy, or developed by one person or program without a network of support. The characteristics and practices of one’s teaching and one’s ways of being a teacher inform, support, and challenge one another. Together, they can serve as a guide in the continuous processes of re(de)fining the teacher characteristics associated with social justice and posing further questions about one’s actions in particular contexts.

Our reading of the literature confirms our idea that teacher “capacities” is best understood as a package of understandings, skills and commitments. It is a broader notion than simply “what teachers need to know,” what “skills” they should have or be seeking to learn, or what “dispositions” they should have or be seeking to acquire. We want to stress here that this “package” of teacher capacity also needs to include conceptual tools for the adjudication of actions for social justice.

CONCLUSIONS

Social justice is a well-intended idea in the teacher education literature and a popular slogan among teacher educators. However, a definition of social justice is rarely included in teacher education policy statements, practices, or the expectations for teacher candidates. To reiterate Hayek’s observation, “It is allowed to float in the air as if everyone will
recognize an instance of it when it appears” (quoted in Novak, p. 1). By not defining social justice and addressing what it means, or by narrowly defining social justice in relation to teacher candidates’ knowledge, skills, and disposition, teacher educators’ and teacher candidates’ actions in the name of social justice are often superficial, ineffective and uniformed.

The theoretical framing of social justice lacks craftsmanship and is often reduced to employing one of many concepts—including equality, equal opportunity and sometimes equity—without elaborating their meanings, putting them in context, noting the differences between and among these concepts and/or acknowledging that they have different implications for education policies and procedures (North (in press); Secada, 1989; Sturman, 1997). A well established tradition in social science scholarship is to acknowledge the theoretical shoulders upon which one’s own work stands. This kind of historical acknowledgment is not found in most of the articles on social justice we reviewed, which contributes to the confusion over the meaning and theoretical framing of social justice.

The literature is also silent about the assessment of social justice in teacher education programs. Very little discussion is offered about the extent to which social justice principles and practices are being used. Observations such as Walker’s (2003) about the necessity of evaluative conceptual tools for social justice should force the question: “Are our actions moving us closer to social justice or further away?” However, judging claims about social justice and teacher capacity in teacher education rarely occurs. Zeichner (2006) makes clear that such conceptual tools are needed when he reminds us that everyone in teacher education these days claims to be working for social justice.

There is some acknowledgement of the context in which education is taking place (e.g. rapid technological innovation, globalization, economic imperatives, and accountability measurers) during discussions of social justice and teacher capacity. For the most part, a language of economic and U.S competitiveness is inherent in the discussion along with some acknowledgment that preparing students of color and poor students to take their place within a global society is important.

There is very little discussion that connects social justice and teacher capacity to the good of society, unless the discussions connect to the political economy and social cohesion. An exception is Britzman’s (2000) discussion of capacity, knowledge, and social concerns. She asks, “What inhibits our capacity to respond ethically to others, to learn something from people we will never meet and to be affected by histories that we may never live?” (p. 202). Instead, the focus is on the changing relation between local and global, and thinking globally becomes the major goal. It is this context which fosters the creation of hyper-individuals “who place value on individual rights, competition and individual achievement” (Pitts, 1998, p. 2).

Finally, we have entered the moment in which teacher education and social justice are sharing a discursive space in mainstream teacher education. The increasing number of statements about the importance of social justice in the focus and scope of major teacher education journals and books, publication of articles that explicitly refer to social justice and number of teacher education programs and professional development programs that endeavor to prepare teachers for social justice are indicative of the increasing focus on social justice in teacher education.

The development of social justice discourse(s) in teacher education appears to be due to the increasing public awareness of and rallying against long standing inequities in areas like academic achievement, school funding, faculty and staff hiring procedures, and the allocation and types of resources. Also contributing to the development of social justice discourses in teacher education is the rising recognition and acknowledgment of
the complexity of education, as communicated by a growing community of scholars across the field of education. Still, as Nieto (2000) laments, we are faced with the “the sluggish pace with which teacher education programs are addressing social justice and equity” (p. 181). Thus, if we return to Horace Mann’s statement that “Education, then, beyond all other devices of human origin, is the great equalizer of the conditions of man,—the balance-wheel of the social machinery,” and we consider the efforts thus far to embed social justice in the development of teacher capacity, we have to admit that much, much work remains to be done.

Acknowledgment

We wish to thank Nadine Goff and Connie E. North for their comments and suggestions on this manuscript.

2.1 A talk to teachers

James Baldwin

About 200 New York City teachers are taking a special in-service course this year on “The Negro: His Role in the Culture and Life of the United States.” The course meets at Public School 180 in Harlem. At the October 16 session the speaker was James Baldwin, who was born and brought up in Harlem and attended Harlem schools. His topic was “The Negro Child—His Self Image.” Mr. Baldwin spoke extemporaneously, and without notes, but his remarks were recorded on tape. By special arrangement with Mr. Baldwin and the New York Board of Education, his talk to the teachers is presented herewith.

Let’s begin by saying that we are living through a very dangerous time. Everyone in this room is in one way or another aware of that. We are in a revolutionary situation, no matter how unpopular that word has become in this country. The society in which we live is desperately menaced, not by Khrushchev, but from within. So any citizen of this country who figures himself as responsible—and particularly those of you who deal with the minds and hearts of young people—must be prepared to “go for broke.” Or to put it another way, you must understand that in the attempt to correct so many generations of bad faith and cruelty, when it is operating not only in the classroom but in society, you will meet the most fantastic, the most brutal, and the most determined resistance. There is no point in pretending that this won’t happen.

Now, since I am talking to school-teachers and I am not a teacher myself, and in some ways am fairly easily intimidated, I beg you to let me leave that and go back to what I think to be the entire purpose of education in the first place. It would seem to me that when a child is born, if I’m the child’s parent, it is my obligation and my high duty to civilize that child. Man is a social animal. He cannot exist without a society. A society, in turn, depends on certain things which everyone within that society takes for granted. Now, the crucial paradox which confronts us here is that the whole process of education occurs within a social framework and is designed to perpetuate the aims of society. Thus, for example, the boys and girls who were born during the era of the Third Reich, when educated to the purposes of the Third Reich, became barbarians. The paradox of education is precisely this—that as one begins to become conscious one begins to examine the society in which he is being educated. The purpose of education, finally, is to create in a person the ability to look at the world for himself, to make his own decisions, to say to himself this is black or this is white, to decide for himself whether there is a God in heaven or not. To ask questions of the universe, and then learn to live with those questions, is the way he achieves his own identity. But no society is really anxious to have that kind of person around. What societies really, ideally want is a citizenry which will simply obey the rules of society. If a society succeeds in this, that society is about to perish. The obligation of anyone who thinks of himself as responsible is to examine society and try to change it and to fight it—at no matter what risk. This is the only hope society has. This is the only way societies change.

Now, if what I have tried to sketch has any validity, it becomes thoroughly clear, at least to me, that any Negro who is born in this country and undergoes the American educational system runs
the risk of becoming schizophrenic. On the one hand he is born in the shadow of the stars and stripes and he is assured it represent a nation which has never lost a war. He pledges allegiance to that flag which guarantees “liberty and justice for all.” He is part of a country in which anyone can become President, and so forth. But on the other hand he is also assured by his country and his countrymen that he has never contributed anything to civilization—that his past is nothing more than a record of humiliations gladly endured. He is assured by the republic that his, his father, his mother, and his ancestors were happy, shiftless, watermelon-eating darkies who loved Mr. Charlie and Miss Ann, that the value he has as a black man is proven by one thing only—his devotion to white people. If you think I am exaggerating, examine the myths which proliferate in this country about Negroes.

Now all this enters the child’s consciousness much sooner than we as adults would like to think it does. As adults, we are easily fooled because we are so anxious to be fooled. But children are very different. Children, not yet aware that it is dangerous to look too deeply at anything, look at everything, look at each other, and draw their own conclusions. They don’t have the vocabulary to express what they see, and we, their elders, know how to intimidate them very easily and very soon. But a black child, looking at the world around him, though he cannot know quite what to make of it, is aware that there is a reason why his mother works so hard, why his father is always on edge. He is aware that there is some reason why, if he sits down in the front of the bus, his father or mother slaps him and drags him to the back of the bus. He is aware that there is some terrible weight on his parents’ shoulders which menaces him. And if isn’t long—in fact it begins when he is in school—before he discovers the shape of his oppression.

Let us say that the child is seven years old and I am his father, and I decide to take him to the zoo, or to Madison Square Garden, or to the U.N. Building, or to any of the tremendous monuments we find all over New York. We get into a bus and we go from where I live on 131st Street and Seventh Avenue downtown through the park and we get into New York City, which is not Harlem. Now, where the boy lives—even if it is a housing project—is in an undesirable neighborhood. If he lives in one of those housing projects of which everyone in New York is so proud, he has at the front door, if not closer, the pimps, the whores, the junkies—in a word, the danger of life in the ghetto. And the child knows this, though he doesn’t know why.

I still remember my first sight of New York. It was really another city when I was born—where I was born. We looked down over the Park Avenue street-car tracks. It was Park Avenue, but I didn’t know what Park Avenue meant downtown. The Park Avenue that I grew up on, which is still standing, is dark and dirty. No one would dream of opening a Tiffany’s on that Park Avenue, and when you go downtown you discover that you are literally in the white world. It is rich—or at least it looks rich. It is clean—because they collect garbage downtown. There are doormen. People walk about as though they owned where they were—and indeed they do. And it’s a great shock. It’s very hard to relate yourself to this. You don’t know what it means. You know—you know instinctively that none of this is for you. You know this before you are told. And who is it for and who is paying for it? And why isn’t it for you?

Later on when you become a grocery boy or messenger and you try to enter one of those buildings a man says, “Go to the back door.” Still later, if you happen by some odd chance to have a friend in one of those buildings, the man says, “Where’s your package?” Now this by no means is the core of the matter. What I’m trying to get at is that by this time the Negro child has had, effectively, almost all the doors of opportunity slammed in his face, and there are very few things he can do about it. He can more or less accept it with an absolutely inarticulate and dangerous rage inside—all the more dangerous because it is never expressed. It is precisely those silent people whom white people see every day of their lives—I mean your porter and your maid, who never say anything more than “Yes Sir” and “No Ma’am.” They will tell you it’s raining if that is what you want to hear, and they will tell you the sun is shining if that is what you want to hear. They really hate you—really hate you because in their eyes (and they’re right) you stand between them
and life. I want to come back to that in a moment. It is the most sinister of the facts, I think, which we now face.

There is something else the Negro child can do, too. Every street boy—and I was a street boy, so I know—looking at the society which has produced him, looking at the standards of that society which are not honored by anybody, looking at your churches and the government and the politicians, understands that this structure is operated for someone else’s benefit—not for his. And there’s no room in it for him. If he is really cunning, really ruthless, really strong—and many of us are—he becomes a kind of criminal. He becomes a kind of criminal because that’s the only way he can live. Harlem and every ghetto in this city—every ghetto in this country—is full of people who live outside the law. They wouldn’t dream of calling a policeman. They wouldn’t, for a moment, listen to any of those professions of which we are so proud on the Fourth of July. They have turned away from this country forever and totally. They live by their wits and really long to see the day when the entire structure comes down.

The point of all this is that black men were brought here as a source of cheap labor. They were indispensable to the economy. In order to justify the fact that men were treated as though they were animals, the white republic had to brainwash itself into believing that they were, indeed, animals and deserved to be treated like animals. Therefore it is almost impossible for any Negro child to discover anything about his actual history. The reason is that this “animal,” once he suspects his own worth, once he starts believing that he is a man, has begun to attack the entire power structure. This is why America has spent such a long time keeping the Negro in his place. What I am trying to suggest to you is that it was not an accident, it was not an act of God, it was not done by well-meaning people muddling into something which they didn’t understand. It was a deliberate policy hammered into place in order to make money from black flesh. And now, in 1963, because we have never faced this fact, we are in intolerable trouble.

The Reconstruction, as I read the evidence, was a bargain between the North and South to this effect: “We’ve liberated them from the land—and delivered them to the bosses.” When we left Mississippi to come North we did not come to freedom. We came to the bottom of the labor market, and we are still there. Even the Depression of the 1930s failed to make a dent in Negroes’ relationship to white workers in the labor unions. Even today, so brainwashed is this republic that people seriously ask in what they suppose to be good faith, “What does the Negro want?” I’ve heard a great many asinine questions in my life, but that is perhaps the most asinine and perhaps the most insulting. But the point here is that people who ask that question, thinking that they ask it in good faith, are really the victims of this conspiracy to make Negroes believe they are less than human.

In order for me to live, I decided very early that some mistake had been made somewhere. I was not a “nigger” even though you called me one. But if I was a “nigger” in your eyes, there was something about you—there was something you needed. I had to realize when I was very young that I was none of those things I was told I was. I was not, for example, happy. I never touched a watermelon for all kinds of reasons. I had been invented by white people, and I knew enough about life by this time to understand that whatever you invent, whatever you project, is you! So where we are now is that a whole country of people believe I’m a “nigger,” and I don’t, and the battle’s on! Because if I am not what I’ve been told I am, then it means that you’re not what you thought you were either! And that is the crisis.

It is not really a “Negro revolution” that is upsetting this country. What is upsetting the country is a sense of its own identity. If, for example, one managed to change the curriculum in all the schools so that Negroes learned more about themselves and their real contributions to this culture, you would be liberating not only Negroes, you’d be liberating white people who know nothing about their own history. And the reason is that if you are compelled to lie about one aspect of anybody’s history, you must lie about it all. If you have to lie about my real role here, if
you have to pretend that I hoed all that cotton just because I loved you, then you have done something to yourself. You are mad.

Now let’s go back a minute. I talked earlier about those silent people—the porter and the maid—who, as I said, don’t look up at the sky if you ask them if it is raining, but look into your face. My ancestors and I were very well trained. We understood very early that this was not a Christian nation. It didn’t matter what you said or how often you went to church. My father and my mother and my grandfather and my grandmother knew that Christians didn’t act this way. It was as simple as that. And if that was so there was no point in dealing with white people in terms of their own moral professions, for they were not going to honor them. What one did was to turn away, smiling all the time, and tell white people what they wanted to hear. But people always accuse you of reckless talk when you say this.

All this means that there are in this country tremendous reservoirs of bitterness which have never been able to find an outlet, but may find an outlet soon. It means that well-meaning white liberals place themselves in great danger when they try to deal with Negroes as though they were missionaries. It means, in brief, that a great price is demanded to liberate all those silent people so that they can breathe for the first time and tell you what they think of you. And a price is demanded to liberate all those white children—some of them near forty—who have never grown up, and who never will grow up, because they have no sense of their identity.

What passes for identity in America is a series of myths about one’s heroic ancestors. It’s astounding to me, for example, that so many people really appear to believe that the country was founded by a band of heroes who wanted to be free. That happens not to be true. What happened was that some people left Europe because they couldn’t stay there any longer and had to go somewhere else to make it. That’s all. They were hungry, they were poor, they were convicts. Those who were making it in England, for example, did not get on the Mayflower. That’s how the country was settled. Not by Gary Cooper. Yet we have a whole race of people, a whole republic, who believe the myths to the point where even today they select political representatives, as far as I can tell, by how closely they resemble Gary Cooper. Now this is dangerously infantile, and it shows in every level of national life. When I was living in Europe, for example, one of the worst revelations to me was the way Americans walked around Europe buying this and buying that and insulting everybody—not even out of malice, just because they didn’t know any better. Well, that is the way they have always treated me. They weren’t cruel, they just didn’t know you were alive. They didn’t know you had any feelings.

What I am trying to suggest here is that in the doing of all this for 100 years or more, it is the American white man who has long since lost his grip on reality. In some peculiar way, having created this myth about Negroes, and the myth about his own history, he created myths about the world so that, for example, he was astounded that some people could prefer Castro, astounded that there are people in the world who don’t go into hiding when they hear the word “Communism,” astounded that Communism is one of the realities of the twentieth century which we will not overcome by pretending that it does not exist. The political level in this country now, on the part of people who should know better, is abysmal.

The Bible says somewhere that where there is no vision the people perish. I don’t think anyone can doubt that in this country today we are menaced—intolerably menaced—by a lack of vision.

It is inconceivable that a sovereign people should continue, as we do so abjectly, to say, “I can’t do anything about it. It’s the government.” The government is the creation of the people. It is responsible to the people. And the people are responsible for it. No American has the right to allow the present government to say, when Negro children are being bombed and hosed and shot and beaten all over the deep South, that there is nothing we can do about it. There must have been a day in this country’s life when the bombing of four children in Sunday School would have created a public uproar and endangered the life of a Governor Wallace. It happened here and there was no public uproar.
I began by saying that one of the paradoxes of education was that precisely at the point when you begin to develop a conscience, you must find yourself at war with your society. It is your responsibility to change society if you think of yourself as an educated person. And on the basis of the evidence—one is compelled to say that this is a backward society. Now if I were a teacher in this school, or any Negro school, and I was dealing with Negro children, who were in my care only a few hours of every day and would then return to their homes and to the streets, children who have an apprehension of their future which with every hour grows grimmer and darker, I would try to teach them—I would try to make them know—that those streets, those houses, those dangers, those agonies by which they are surrounded are criminal. I would try to make each child know that these things are the results of a criminal conspiracy to destroy him. I would teach him that if he intends to get to be a man, he must at once decide that he is stronger than this conspiracy and that he must never make his peace with it. And that one of his weapons for refusing to make his peace with it and for destroying it depends on what he decides he is worth. I would teach him that there are currently very few standards in this country which are worth a man’s respect. That it is up to him to begin to change these standards for the sake of the life and the health of the country. I would suggest to him that the popular culture—as represented, for example, on television and in comic books and in movies—is based on fantasies created by very ill people, and he must be aware that these are fantasies that have nothing to do with reality. I would teach him that the press he reads is not as free as it says it is—and that he can do something about that, too. I would try to make him know that just an American history is longer, larger, more various, more beautiful, and more terrible than anything anyone has ever said about it, so is the world larger, more daring, more beautiful and more terrible, but principally larger—and that it belongs to him. I would teach him that he doesn’t have to be bound by the expediencies of any given Administration, any given policy, any given time—that he has the right and the necessity to examine everything. I would try to show him that one has not learned anything about Castro when one says, “He is a Communist.” This is a way of not learning something about Castro, something about Cuba, something, in fact, about the world. I would suggest to him that he is living, at the moment, in an enormous province. America is not the world and if America is going to become a nation, she must find a way—and this child must help her to find a way—to use the tremendous potential and tremendous energy which this child represents. If this country does not find a way to use that energy it will be destroyed by that energy.
2.2 Teachers as cultural workers
Letters to those who dare teach

Paulo Freire

Donaldo Macedo, Dale Koike, and Alexandre Oliveira

FOURTH LETTER

On the indispensable qualities of progressive teachers for their better performance

I would like to make it clear that the attributes I am going to speak about, which seem to me to be indispensable to the progressive teacher, are qualities acquired gradually through practice. Furthermore, they are developed through practice in concurrence with a political decision that the educator’s role is crucial. Thus the attributes I am going to speak about are not attributes that we can be born with or that can be bestowed upon us by decree or as a gift. In addition, the order in which I list them here is not intended to rank their value. They are all necessary for a progressive educational practice.

I shall start with humility, which here by no means carries the connotation of a lack of self-respect, or resignation, or of cowardice. On the contrary, humility requires courage, self-confidence, self-respect, and respect for others.

Humility helps us to understand this obvious truth: No one knows it all; no one is ignorant of everything. We all know something; we are all ignorant of something. Without humility, one can hardly listen with respect to those one judges to be too far below one’s own level of competence. But the humility that enables one to listen even to those considered less competent should not be an act of condescension or resemble the behavior of those fulfilling a vow: “I promise the Virgin Mary that, if the problem with my eyes turns out not to be serious, I will listen to the rude and ignorant parents of my students with attention.” No. None of that. Listening to all that come to us, regardless of their intellectual level, is a human duty and reveals an identification with democracy and not with elitism.

In fact, I cannot see how one could reconcile adherence to an ideal of democracy and of overcoming prejudice with a proud or arrogant posture in which one feels full of oneself. How can I listen to the other, how can I hold a dialogue, if I can only listen to myself, if I can only see myself, if nothing or no one other than myself can touch me or move me? If while humble, one does undermine oneself or accepts humiliation, one is also always ready to teach and to learn. Humility helps me avoid being entrenched in the circuit of my own truth. One of the fundamental auxiliaries of humility is common sense, which serves to remind us that certain attitudes may lead us too close to becoming lost.

The arrogance of “You don’t know who you are dealing with . . .,” the conceit of the know-it-all with an unrestrained desire to make his or her knowledge known and recognized—none of this has anything to do with the tameness (which is not apathy) of the humble. Humility does not flourish in people’s insecurities but in the insecure security of the more aware, and thus this insecure security is one of the expressions of humility, as is uncertain certainty, unlike certainty,
which is excessively sure of itself. The authoritarians’ stance, in contrast, is sectarian. Theirs is the only truth, and it must be imposed on others. It is in their truth that others’ salvation resides. Their knowledge “illuminates” the obscurity or the ignorance of others, who then must be subjected to the knowledge and arrogance of the authoritarian.

I will return to my analysis of authoritarianism, whether that of parents or teachers. As one might expect, authoritarianism will at times cause children and students to adopt rebellious positions, defiant of any limit, discipline, or authority. But it will also lead to apathy, excessive obedience, uncritical conformity, lack of resistance against authoritarian discourse, self-abnegation, and fear of freedom.

In saying that authoritarianism may generate various types of reactions, I understand that on a human level things do not happen so mechanically and happily. Thus it is possible that certain children will go through the rigors of arbitrariness unscathed, which does not give us the license to gamble on that possibility and fail to make an effort to become less authoritarian. And if we can’t make that effort for our dream for democracy, we should make it out of respect for beings in development, our children and our students.

But to the humility with which teachers perform and relate to their students, another quality needs to be added: lovingness, without which their work would lose its meaning. And here I mean lovingness not only toward the students but also toward the very process of teaching. I must confess, not meaning to cavil, that I do not believe educators can survive the negativities of their trade without some sort of “armed love,” as the poet Tiago de Melo would say. Without it they could not survive all the injustice or the government’s contempt, which is expressed in the shameful wages and the arbitrary treatment of teachers, not coddling mothers, who take a stand, who participate in protest activities through their union, who are punished, and who yet remain devoted to their work with students.

It is indeed necessary, however, that this love be an “armed love,” the fighting love of those convinced of the right and the duty to fight, to denounce, and to announce. It is this form of love that is indispensable to the progressive educator and that we must all learn.

It so happens, however, that this lovingness I speak about, the dream for which I fight and for whose realization I constantly prepare myself, demands that I invent in myself, in my social experience, another quality: courage, to fight and to love.

Courage, as a virtue, is not something I can find outside myself. Because it comprises the conquering of my fears, it implies fear.

First of all, in speaking about fear we must make sure that we are speaking of something very concrete. In other words, fear is not an abstraction. Second, we must make sure that we understand that we are speaking of something very normal. And, when we speak about fear, we are faced with the need to be very clear of our choices, and that requires certain concrete procedures and practices, which are the very experiences that cause fear.

To the extent that I become clearer about my choices and my dreams, which are substantively political and attributively pedagogical, and to the extent that I recognize that though an educator I am also a political agent, I can better understand why I fear and realize how far we still have to go to improve our democracy. I also understand that as we put into practice an education that critically provokes the learner’s consciousness, we are necessarily working against myths that deform us. As we confront such myths, we also face the dominant power because those myths are nothing but the expression of this power, of its ideology.

When we are faced with concrete fears, such as that of losing our jobs or of not being promoted, we feel the need to set certain limits to our fear. Before anything else, we begin to recognize that fear is a manifestation of our being alive. I do not need to hide my fears. But I must not allow my fears to immobilize me. If I am secure in my political dream, having tactics that may lesson my risk, I must go on with the fight. Hence the need to be in control of my fear, to educate my fear, from which is finally born to my courage. Thus I must neither, on the one hand, deny my
fears nor, on the other, surrender myself to them. Instead, I must control them, for it is in the very exercise of this control that my necessary courage is shared.

That is why though there may be fear without courage, the fear that devastates and paralyzes us, there may never be courage without fear, that which “speaks” of our humanness as we manage to limit, subject, and control it.

Tolerance is another virtue. Without it no serious pedagogical work is possible; without it no authentic democratic experience is viable; without it all progressive educational practice denies itself. Tolerance is not, however, the irresponsible position of those who play the game of make-believe.

Being tolerant does not mean acquiescing to the intolerable; it does not mean covering up disrespect; it does not mean coddling the aggressor or disguising aggression. Tolerance is the virtue that teaches us to live with the different. It teaches us to learn from and respect the different.

On an initial level, tolerance may almost seem to be a favor, as if being tolerant were a courteous, thoughtful way of accepting, of tolerating, the not-quite-desired presence of one’s opposite, a civilized way of permitting a coexistence that might seem repugnant. That, however, is hypocrisy, not tolerance. Hypocrisy is a defect; it is degradation. Tolerance is a virtue. Thus if I live tolerance, I should embrace it. I must experience it as something that makes me coherent first with my historical being, inconclusive as that may sound, and second with my democratic political choice. I cannot see how one might be democratic without experiencing tolerance, coexistence with the different, as a fundamental principle.

No one can learn tolerance in a climate of irresponsibility, which does not produce democracy. The act of tolerating requires a climate in which limits may be established, in which there are principles to be respected. That is why tolerance is not coexistence with the intolerable. Under an authoritarian regime, in which authority is abused, or a permissive one, in which freedom is not limited, one can hardly learn tolerance. Tolerance requires respect, discipline, and ethics. The authoritarian, filled with sexual, racial, and class prejudices, can never become tolerant without first overcoming his or her prejudices. That is why a bigot’s progressive discourse, which contrasts with his or her practice, is a false discourse. That is also why those who embrace scientism are equally intolerant, because they take science for the ultimate truth, outside of which nothing counts, believing that only science can provide certainty. Those immersed in scientism cannot be tolerant, though that fact should not discredit science.

I would also like to add decisiveness, security, the tension between patience and impatience, and joy of living to the group of qualities to be nourished in ourselves if we are to be progressive educators.

An educator’s ability to make decisions is absolutely necessary to his or her educational work. It is by demonstrating an ability to make decisions that an educator teaches the difficult virtue of decisiveness. Making decisions is difficult to the extent that it signifies breaking free to choose. No one ever decides anything without making a trade-off, weighing one thing against another, one point against another, one person against another. Thus every choice that follows a particular decision calls for careful evaluation in comparing and opting for one of the possible sides, persons, or positions. It is evaluation, with all of its implications, that helps us to finally make choices.

Decision making is rupture and is not always an easy experience. But it is not possible to exist without rupturing, no matter how hard it may be.

One of the deficiencies that an educator may possess is an inability to make decisions. Such indecision is perceived by learners as either moral weakness or professional incompetence. Democratic educators must not nullify themselves in the name of being democratic. On the contrary, although they cannot take sole responsibility for the lives of their students, they must not, in the name of democracy, evade the responsibility of making decisions. At the same time,
they must not be arbitrary in their decisions. Setting an example, as an authority figure, of not taking responsibility for one’s duties, of allowing oneself to fall into permissiveness, is even more somber a fate for a teacher than abusing authority.

There are plenty of occasions when a good democracy-oriented pedagogical example is to make the decision in question with the students, after analyzing the problem. Other times, when the decision to be made is within the scope of the educator’s expertise, there is no reason not to take action, to be negligent.

Indecision reveals a lack of confidence; but confidence is indispensable for anyone with responsibilities in government, whether of a class, a family, an institution, a company, or the state.

Security, confidence, on the other hand, requires scientific competence, political clarity, and ethical integrity.

One cannot be secure in one’s actions without knowing how to support those actions scientifically, without at least some idea of what one does, why, and to what end. The same is true of allegiance: One must know whom or what one is for or against. Nor can one be secure in one’s actions without being moved by them, or if one hurts the dignity of others, exposing them to embarrassing situations. Such ethical irresponsibility and cynicism show an inability to live up to the educator’s task, which demands critically disciplined performance with which to challenge learners. On the one hand, such discipline reflects the educator’s competence, as it is gradually revealed to the learners, discreetly and humbly, without arrogant outbursts; on the other it affects the balance with which the educator exercises authority—secure, lucid, and determined.

None of this, however, can be realized if an educator lacks a taste for permanently seeking justice. No one can prevent a teacher from liking one student more than another, for any number of reasons. That is a teacher’s right. What a teacher must not do is disregard the rights of the other students in favoring one student.

There is another fundamental quality that the progressive educator must not lack: He or she must exercise wisdom in experiencing the tension between patience and impatience. Neither patience nor impatience alone is what is called for. Patience alone may bring the educator to a position of resignation, of permissiveness, that denies the educator’s democratic dream. Unaccompanied patience may lead to immobility, to inactivity. Conversely, impatience alone may lead the educator to blind activism, to action for its own sake, to a practice that does not respect the necessary relationship between tactics and strategy. Isolated patience tends to hinder the attainment of objectives central to the educator’s practice, making it soft and ineffectual. Untempered impatience threatens the success of one’s practice, which becomes lost in the arrogance of judging oneself the owner of history. Patience alone consumes itself in mere prattle; impatience alone consumes itself in irresponsible activism.

Virtue, then, does not lie in experience either without the other but, rather, in living the permanent tension between the two. The educator must live and work impatiently patiently, never surrendering entirely to either.

Alongside this harmonious, balanced way of being and working there must figure another quality, which I have been calling verbal parsimony. Verbal parsimony is implied in the assumption of patience-impatience. Those who live impatient patience will rarely lose control over their words; they will rarely exceed the limits of considered yet energetic discourse. Those who predominantly live patience stifle their legitimate anger, which then is expressed through weak and resigned discourse. Those, on the other hand, who are all uncontrolled impatience tend toward lack of restraint in discourse. The patient person’s discourse is always well-behaved, whereas that of the impatient person generally goes beyond what reality itself could withstand.

Both of these kinds of discourse, the overly controlled as well as the undisciplined, contribute to the preservation of the status quo. The first falls short of the demands of the status quo; the second surpasses its limits.
The benevolent classroom discourse and practice of those who are only patient suggest to learners that anything, or almost anything, goes. There is in the air a sense of a nearly infinite patience. Nervous, arrogant, uncontrolled, unrealistic, unrestrained discourse will find itself immersed in inconsequence and irresponsibility.

In no way do these discourses contribute to the learners’ education.

There are also those who are excessively restrained in their discourse but who once in a while lose control. From absolute patience, they leap unexpectedly into uncontainable impatience, creating a climate of insecurity for everyone around them, always with terrible effects.

Countless mothers and fathers behave so. Today their words and their actions are permissive, but they transform tomorrow into the opposite, a universe of authoritarian discourse and orders, which not only leaves their sons and daughters appalled but, above all, makes them insecure. Such immoderate parental behavior limits children’s emotional balance, which they need to grow up. Loving is not enough; one must know how to love.

Though I recognize that these reflections on qualities are incomplete, I would also like to briefly discuss joy of living as a fundamental virtue for democratic educational practice.

By completely giving myself to life rather than to death—without meaning either to deny death or the mythicize life—I can free myself to surrender to the joy of living, without having to hide the reasons for sadness in life, which prepares me to stimulate and champion joy in the school.

Whether or not we are willing to overcome slips or inconsistencies, by living humility, lovingness, courage, tolerance, competence, decisiveness, patience-impatience, and verbal parsimony, we contribute to creating a happy, joyful school. We forge a school-adventure, a school that marches on, that is not afraid of the risks, and that rejects immobility. It is a school that thinks, that participates, that creates, that speaks, that loves, that guesses, that passionately embraces and says yes to life. It is not a school that quiets down and quits.

Indeed the easy way out in dealing with the obstacles posed by governmental contempt and the arbitrariness of antidemocratic authorities is the fatalist resignation in which many of us find ourselves.

“What can I do? Whether they call me teacher or coddling mother, I am still underpaid, disregarded, and uncared for. Well, so be it.” In reality, this is the most convenient position, but it is also the position of someone who quits the struggle, who quits history. It is the position of those who renounce conflict, the lack of which undermines the dignity of life. There may not be life or human existence without struggle and conflict. Conflict2 shares in our conscience. Denying conflict, we ignore even the most mundane aspects of our vital and social experience. Trying to escape conflict, we preserve the status quo.

Thus I can see no alternative for educators to unity within the diversity of their interests in defending their rights. Such rights include the right to freedom in teaching, the right to speak, the right to better conditions for pedagogical work, the right to paid sabbaticals for continuing education, the right to be coherent, the right to criticize the authorities without fear of retaliation (which entails the duty to criticize truthfully), the right to the duty to be serious and coherent and to not have to lie to survive.

We must fight so that these rights are not just recognized but respected and implemented. At times we may need to fight side by side with the unions; at other times we may need to fight against them, if their leadership is sectarian, whether right or left. At other times we also need to fight as a progressive administration against the devilish anger of the obsolete; of the traditionalists, some of whom judge themselves progressive; and of the neoliberalists, who see themselves as the culmination of history.

2.3 The dialectic of freedom

M. Greene

Our exploration began in an awareness of a taken-for-grantedness and a void where present-day thinking is concerned, of a lassitude and a lack of care. The void exists with regard to the question of freedom, the givenness of which is taken for granted. We have, in the course of this inquiry, distinguished freedom from liberty for the purpose of highlighting the tension and the drama of personal choosing in an intersubjective field—choosing among others in a conditioned world. Liberty may be conceived of in social or political terms: Embodied in laws or contracts or formulations of human rights, it carves out a domain where free choices can be made. For Isaiah Berlin, the sense of freedom entails “the absence of obstacles to possible choices and activities—absence of obstructions on roads along which a man can decide to walk” (1970, p. xxxix). We recognize, as he did, that among the obstructions to be removed (and preferably through social action) are those raised by poverty, sickness, even ignorance. We recognize as well that the removal of obstacles to “possible choices and activities” may, in many cases, lead to domination by the few and the closing off of opportunities for the many. We know too that, even given conditions of liberty, many people do not act on their freedom; they do not risk becoming different; they acceded; often, they submit.

The problems for education, therefore, are manifold. Certain ones cluster around the presumed connection between freedom and autonomy; certain ones have to do with the relation between freedom and community, most significantly moral community. Autonomy, many believe, is a prime characteristic of the educated person. To be autonomous is to be self-directed and responsible; it is to be capable of acting in accord with internalized norms and principles; it is to be insightful enough to know and understand one’s impulses, one’s motives, and the influences of one’s past. There are those who ascribe to the autonomous person a free and rational will, capable of making rational sense of an extended objective world. Values like independence, self-sufficiency, and authenticity are associated with autonomy, because the truly autonomous person is not supposed to be susceptible to outside manipulations and compulsions. Indeed, he/she can, by maintaining a calm and rational stance, transcend compulsions and complexes that might otherwise interfere with judgment and clarity.

As is well known, the attainment of autonomy characterizes the highest state in the developmental patterns devised by Jean Piaget (1977) and, later, by Lawrence Kohlberg (1971). Piaget saw autonomy as emergent from experience of mutual reciprocity and regard. A life plan, he wrote, is “an affirmation of autonomy”; and “a life plan is above all a scale of values which puts some ideals above others and subordinates the middle-range values to goals thought of as permanent” (p. 443). For Kohlberg, whose primary interest was in moral development, people who reach a high-enough cognitive stage of development become autonomous enough to guide their choices by universalizable principles of justice and benevolence. “That welfare and justice,” he said, “are guiding principles of legislation as well as of individual moral action points to the fact that a principle is always a maxim or a rule for making rules or laws as well as a maxim of individual situational conduct” (p. 60). If the presumption is that autonomy is associated with “higher order” thinking and with the ability to conceptualize
abstractions like human rights and justice, and if indeed such principles become maxims of individual conduct, many conclude that autonomous persons can be considered free persons. To abide by internalized principles, after all, is to acknowledge the rule of “ought” or “should.” R. M. Hare has written that it is because we can act in this way or that, that we ask whether we ought to do this or that (1965, p. 51ff.). Granting the various usages of words like “ought” and “should,” we can still understand why persons who are capable of principled action and who are responsive to ideals they have incarnated for themselves are considered self-determining and therefore free.

The implications for education have had to do with cognition—with logical thinking, the resolution of moral dilemmas, the mastery of interpersonal rules. For R. S. Peters, this kind of education involves the nurture of a “rational passion” associated with commitment to the worthwhile. Peters wrote: “Respect for truth is intimately connected with fairness, and respect for persons, which together with freedom, are fundamental principles which underlie our moral life and which are personalized in the form of the rational passions” (1970, p. 55). The problem with this highly cognitive focus in the classroom has in part to do with what it excludes. Also, it has to do with whether or not reasoning is enough when it comes to acting in a resistant world, or opening fields of possibilities among which people may choose to choose. There have been many reports on classroom discussions of issues ostensibly of moment to the students: cheating, betraying confidences, nonviolent resistance, sexual relations, discrimination. Not only has there been little evidence that the participants take such issues personally; there has been little sigh of any transfer to situations in the “real world,” even when there were opportunities (say, in a peace demonstration) to act on what were affirmed as guiding principles. We will touch, before long, on the importance of imagination and the exploration of alternative possibilities. It seems clear, as Oliver and Bane have said, that young people “need the opportunity to project themselves in rich hypothetical worlds created by their own imagination or those of dramatic artists. More important, they need the opportunity to test out new forms of social order—and only then to reason about their moral implications” (1971, p. 270).

Most of the writers to whom we have referred in these paragraphs are, or course, interested primarily in moral commitments, not freedom per se. It does appear, as has been said, that there is a presupposition linking autonomy to personal freedom, autonomy in the sense of rational and principled self-government. For many, a movement out of heteronomous existence, with all its conditioning and shaping factors, cannot but be a movement in the direction of a kind of rule-governed self-sufficiency and independence. And this (at least where qualified students are concerned) is viewed by numbers of educators as the most desirable end of pedagogy, to be achieved by liberal education and commitment to the worthwhile.

Such inquiries into women’s moral development as Carol Gilligan’s In a Different Voice (1981) and into women’s distinctive modes of reflection as Women’s Ways of Knowing by Mary Field Belenky and her colleagues (1986) have, at the very least, made problematic the focal emphasis on separateness and responsiveness to purely formal principle. Gilligan has pointed time and time again to the neglect of the patterns of women’s development, whose “elusive mystery . . . lies in its recognition of the continuing importance of attachment in the human life cycle. Woman’s place in man’s life cycle is to protect this recognition while the developmental litany intones the celebration of separation, autonomy, individuation, and natural rights” (p. 23). Belenky’s work emphasizes the relational thinking and the integration of voices that characterize women’s life stories. Where freedom is concerned (and it is rarely mentioned in contemporary women’s literature), it is taken to signify either liberation from domination of the provision of spaces where choices can be made. There is a general acknowledgement that the opening of such spaces depends on support and connectedness. “Connected teaching,” for example, involves what Nel Noddings describes as “care” (1984, pp. 15–16). Rather than posing dilemmas to students or presenting models of expertise, the caring teacher tries to look through students’ eyes, to struggle with them as subjects in search of their own projects, their own ways of making sense
of the world. Reflectiveness, even logical thinking remain important; but the point of cognitive development is not to gain an increasingly complete grasp of abstract principles. It is to interpret from as many vantage points as possible lived experience, the ways there are of being in the world.

This recent attentiveness to mutuality and to responsiveness to others’ wants and concerns cannot but recall the contextual thinking of Dewey, Merleau-Ponty, Hannah Arendt, Michel Foucault, and others. Dewey wrote of the habit of viewing sociality as a trait of an individual “isolated by nature, quite as much as, say, a tendency to combine with others in order to get protection against something threatening one’s own private self” (1938/1963, p. 22). He believed it essential to consider the problem of freedom within the context of culture, surely within a context of multiple transactions and relationships. Part of the difficulty for him and those who followed him had to do with the positing of a “free will” associated with a mysterious interiority, even as it had to do with a decontextualization that denied the influences of associated life. Hannah Arendt found some of the century’s worst contradictions in the distinction made between “inner” freedom and the kind of outward “unfreedom” or causality described by Immanuel Kant and his successors. The search for a freedom within, she said, denied notions of praxis and the public space. For her, as we have seen, freedom was identified with a space that provided room for human action and interaction. She believed that freedom was the major reason persons came together in political orders; it is, she wrote, “the raison d’être of politics” and the opposite of “inner freedom,” which she called “the inward space into which we may escape from external coercion and feel free” (1961, pp. 141-146).

The relationships and responsibilities stressed by women inquirers are not to be identified entirely with the cultural matrix of such importance to Dewey; nor is either emphasis precisely the same as Arendt’s concern with the public space. Nonetheless, all these strains of thought are significant responses to present calls, in philosophy and the human sciences, for some reconstitution of core values, some rebuilding of community today. Attention is being repeatedly called to the crucial good of “friendship” in the Aristotelian qualitative-moral sense (see Nichomachean Ethics, Bk. VIII)—the relation between those who desire the good of friends for their friends’ sake, no matter how different that “good” may be from what a companion chooses and pursues. In some degree, this is a way of acknowledging and respecting another’s freedom to choose among possibilities, as it involves a desire to foster that choosing, because the other is a friend. There is talk of “solidarity” as well, as in the case of Richard Rorty talking about human beings giving sense to their lives by placing them in a larger context. There are two ways of doing this, he says: “by telling the story of their contribution to a community” or “by describing themselves as standing in immediate relation to a nonhuman reality.” He calls the first story an example of the desire for solidarity, the second an example of the desire for objectivity. “Insofar as a person is seeking solidarity, he or she does not ask about the relation between the practices of the chosen community and something outside that community” (1985, p. 3). Rorty associates the notion of solidarity with pragmatism, especially when the suggestion is made that the only foundation for the sense of community is “shared hope and the trust created by such sharing.” This removes not only objectivism but absoluteness; it returns us to the ideas of relatedness, communication, and disclosure, which provide the context in which (according to the viewpoint of this book) freedom must be pursued.

It is because of people’s embeddedness in memory and history, because of their incipient sense of community, that freedom in education cannot be conceived either as an autonomous achievement or as merely one of the principles underlying our moral life, personalized (as R. S. Peters said) “in the form of rational passions.” It is because of the apparent normality, the given-ness of young people’s everyday lives, that intentional actions ought to be undertaken to bring things within the scope of students’ attention, to make situations more palpable and visible. Only when they are visible and “at hand” are they likely to cry out for interpretation. And only when individuals are empowered to interpret the situations they live together do they become able to
mediate between the object-world and their own consciousness, to locate themselves so that freedom can appear.

Aware of how living persons are enmeshed, engaged with what surrounds them, Merleau-Ponty wrote:

It is because we are through and through compounded of relationships with the world that for us the only way to become aware of the fact is to suspend the resultant activity . . . to put it out of play. Not because we reject the certainties of common sense and a natural attitude to things—they are, on the contrary, the consistent theme of philosophy—but because, being the presupposed basis of any thought, they are taken for granted and go unnoticed, and because in order to arouse them and bring them into view we have to suspend for a moment our recognition of them.

(1962/1967, p. xiii)

He was not talking about withdrawing into some interior domain. Nor was he calling for a deflection of attention from ordinary life. Rather, he was exploring the possibilities of seeing what was ordinarily obscured by the familiar, so much part of the accustomed and the everyday that it escaped notice entirely. We might think about the clocks that play such important parts in schoolrooms, or school bells, or loudspeakers blaring at the beginning and end of the day; about calling individual children “third graders” or “lower track”; about threats to summon the remote principal; even about the Pledge of Allegiance, and about the flags drooping in the public rooms. Why should these phenomena be presupposed as a “basis” for thought and self-identification? We might think of the way the chalkboard is placed, of the peculiar distancing of the teacher at the front desk, of books firmly shut before the reading is done. The point is to find a means of making all this an object of thought, of critical attention. And we may be reminded again of Foucault’s remark that “thought is freedom in relation to what one does.” Part of the effort might be to defamiliarize things, to make them strange. How would a Martian view what was there, a “boat person” newly arrived? What would happen if the hands were removed from the clock? (No one, for instance, who has read William Faulkner’s The Sound and the Fury is likely to forget the strangeness of what happens when Quentin pulls the hands off his watch on the day of his suicide. “Hearing it, that is,” thinks Quentin, “I don’t suppose anybody ever deliberately listens to a watch or a clock. You don’t have to. You can be oblivious to the sound for a long while, then in a second of ticking it can create in the mind unbroken the long diminishing parade of time you didn’t hear” [1946, p. 96]. Later, he remembers that “Father said clocks slay time. He said time is dead as long as it is being clicked off by little wheels; only when the clock stops does time come to life” [p. 104]. Reading that, one cannot but find the clock-field, the clock-world, expanding. And the possibilities of thinking multiply.) What of paper? Why is there so much paper? So many files? (George Konrad’s novel about a Hungarian social worker, called The Caseworker, prove, comfort, threaten, grant, deny, demand, approve . . . the order I defend is brutal though fragile, it is unpleasant and austere; its ideas are impoverished and its style is lacking in grace . . . I repudiate the high priests of individual salvation and the sob sisters of altruism, who exchange commonplace partial responsibility for the aesthetic transports of cosmo-historical guilt or the gratuitous slogans of universal love. I refuse to emulate these Sunday-school clowns and prefer—I know my limitations—to be the sceptical bureaucrat that I am. My highest aspiration is that a medium-rank, utterly insignificant civil servant should, as far as possible, live with his eyes open” [1974, p. 168]. Again, familiar bureaucratic orders in one’s own world thrust themselves into visibility. Seeing more, feeling more, one reaches out for more to do.)

Walker Percy’s narrator in The Moviegoer says it in another way. He is trying to relieve his own boredom, a boredom verging on despair; and the idea of a search suddenly occurs to him.
What is the nature of the search? you ask. Really, it is very simple, at least for a fellow like me; so simple that it is easily overlooked.

The search is what anyone would undertake if he were not sunk in the everydayness of his own life. This morning, for example, I felt as if I had come to myself on a strange island. And what does such a castaway do? Why, he pokes around the neighborhood and he doesn’t miss a trick.

To become aware of the possibility of the search is to be onto something. Not to be onto something is to be in despair.

To undertake a search is, of course, to take an initiative, to refuse stasis and the flatness of ordinary life. Since the narrator says he was “sunk in everydayness,” his search is clearly for another perspective, one that will disclose what he has never seen. Even to realize that he can be “onto something” is to begin perceiving lacks in his own life. The question as to what the “neighborhood” holds and implies remains open. He may be moved to “poke around” because others have taken heed of him, because he has appeared in the open for almost the first time. If this is so, he may acquire the space that will free him from his environment of everydayness. The experience may be one denoting a willingness “to learn again to see the world”—and to restore “a power to signify, a birth of meaning, or a wild meaning, an expression of experience by experience” (Merleau-Ponty, 1962/1967, p. 60). I am suggesting that there may be an integral relationship between reaching out to learn to learn and the “search” that involves a pursuit of freedom. Without being “onto something,” young people feel little pressure, little challenge. There are no mountains they particularly want to climb, so there are few obstacles with which they feel they need to engage. They may take no heed of neighborhood shapes and events once they have become used to them—even the figures of homelessness, the wanderers who are mentally ill, the garbage-strewn lots, the burned-out buildings. It may be that no one communicates the importance of thinking about them or suggests the need to play with hypothetical alternatives. There may be no sense of identification with people sitting on the benches, with children hanging around the street corners after dark. There may be no ability to take it seriously, to take it personally. Visible or invisible, the world may not be problematized; no one aches to break through a horizon, aches in the presence of the question itself. So there are no tensions, no desires to reach beyond.

There is an analogy here for the passivity and the disinterest that prevent discoveries in classrooms, that discourage inquiries, that make even reading seem irrelevant. It is not simply a matter of motivation or interest. In this context, we can call it a question having to do with freedom or, perhaps, the absence of freedom in our schools. By that I do not necessarily mean the ordinary limits and constraints, or even the rules established to ensure order. I mean, in part, the apparent absence of concern for the ways in which young people feel conditioned, determined, even fated by prevailing circumstances. Members of minority groups, we are repeatedly informed, do not see the uses of commitment to schooling and studying. No matter how they yearn for success in society, they are convinced of inimical forces all around them, barricades that cannot be overcome. Poor children and others often experience the weight of what is called “cultural reproduction,” although they cannot name it or resist it. By that is meant not only the reproduction of ways of knowing, believing, and valuing, but the maintenance of social patternings and stratifications as well. The young people may not chafe under the inequities being kept alive through schools, as inequities often are; they are likely to treat them as wholly “normal,” as predictable as natural laws. The same might be said about advantaged children who grow up with a sense of entitlement and privilege, but still feel they have no choice.

The challenge is to engage as many young people as possible in the thought that is freedom—the mode of thought that moved Sarah Grimké, Elizabeth Cady Stanton, Septima Clark, Leonard Covello, the Reverend King, and so many others into action. Submergence and the inability to name what lies around interfere with questioning and learning. Dewey had something much like
this in mind when he emphasized the dangers of “recurrence, complete uniformity,” “the routine and mechanical” (1934, p. 272). What he sometimes called the “anaesthetic” in experience is what numbs people and prevents them from reaching out, from launching inquiries. For Dewey, experience becomes fully conscious only when meanings derived from earlier experience enter in through the exercise of the imaginative capacity, since imagination “is the only gateway through which these meanings can find their way into a present interaction; or rather . . . the conscious adjustment of the new and the old is imagination” (p. 272). The word, the concept “conscious” must be emphasized. Experience, for Dewey, becomes “human and conscious” only when what is “given here and now is extended by meanings and values drawn from what is absent in fact and present only imaginatively.” Conscious thinking always involves a risk, a “venture into the unknown”; and it occurs against a background of funded or sedimented meanings that must themselves be tapped and articulated, so that the mind can continue dealing consciously and solicitously with lived situations, those situations (as Dewey put it) “in which we find ourselves” (p. 263).

Education for freedom must clearly focus on the range of human intelligences, the multiple languages and symbol systems available for ordering experience and making sense of the lived world. Dewey was bitterly opposed to the anti-intellectual tendencies in the culture and frequently gave voice to what he called “a plea for casting off that intellectual timidity which hampers the wings of imagination, a plea for speculative audacity, for more faith in ideas, sloughing off a cowardly reliance upon those partial ideas to which we are wont to give the name facts” (1931, p. 12). He spoke often as well about the kinds of inquiry that deliberately challenge desires for certainty, for fixity. He would undoubtedly have agreed with John Passmore’s more recent call for “critico-creative thinking,” the kind that is consciously norm-governed but at once willing to challenge rules that become irrelevant or stultifying. No principle, Passmore wrote, no person or text or work of art should be kept beyond the reach of rational criticism. There should nonetheless be a continuing initiation into the great traditions in which we are all, whether we are aware of it or not, embedded. Passmore went on:

Critical thinking as it is exhibited in the great traditions conjoins imagination and criticism in a single form of thinking; in literature, science, history, philosophy or technology, the free flow of the imagination is controlled by criticism and criticisms are transformed into a new way of looking at things. Not that either the free exercise of the imagination or the raising of objections is in itself to be despised; the first can be suggestive of new ideas, the second can show the need for them. But certainly education tries to develop the two in combination. The educator is interested in encouraging critical discussion as distinct from the mere raising of objections; and discussion is an exercise of the imagination.

(1975, p. 33)

A concern for the critical and the imaginative, for the opening of new ways of “looking at things,” is wholly at odds with the technicist and behaviorist emphases we still find in American schools. It represents a challenge, not yet met, to the hollow formulations, the mystifications so characteristic of our time. We have taken note of the forms of evangelism and fundamentalism, the confused uneasiness with modernism that so often finds expression in anti-intellectualism or an arid focus on “Great Books.” Given the dangers of small-mindedness and privatism, however, I do not think it sufficient to develop even the most variegated, most critical, most imaginative, most “liberal” approach to the education of the young. If we are seriously interested in education for freedom as well as for the opening of cognitive perspectives, it is also important to find a way of developing a praxis of educational consequence that opens the spaces necessary for the remaking of a democratic community. For this to happen, there must of course be a new commitment to intelligence, a new fidelity in communication, a new regard for imagination. It would mean fresh and sometimes startling winds blowing through the classrooms of the nation. It would
mean the granting of audibility to numerous voices seldom heard before and, at once, an involvement with all sorts of young people being provoked to make their own the multilinguality needed for structuring of contemporary experience and thematizing lived worlds. The languages required include many of the traditional modes of sensemaking: the academic disciplines, the fields of study. But none of them must ever be thought of as complete or all-encompassing, developed as they have been to respond to particular kinds of questions posed at particular moments in time. Turned, as lenses or perspectives, on the shared world of actualities, they cannot but continue resonating and reforming in the light of new undercurrents, new questions, new uncertainties.

Let us say young high school students are studying history. Clearly, they require some understanding of the rules of evidence where the historical record is concerned. They need to distinguish among sources, to single out among multiple determinants those forces that can be identified as causal, to find the places where chance cuts across necessity, to recognize when calculations are appropriate and when they are not. All this takes reflective comprehension of the morns governing the discipline of history. But this does not end or exhaust such study. There is a consciousness now, as there was not in time past, of the significance of doing history “from the ground up,” of penetrating the so-called “cultures of silence” in order to discover what ordinary farmers and storekeepers and elementary schoolteachers and street children and Asian newcomers think and have thought about an event like the Holocaust or the Vietnam War or the bombing of Hiroshima or the repression in South Africa that continues to affect them directly or indirectly even as it recedes into the visualizable past. And they may be brought to find out that a range of informed viewpoints may be just as important when it comes to understanding the Civil War, or the industrial revolution, or the slave trade, or the Children’s Crusade. Clearly, if the voices of participants or near-participants (front-line soldiers, factory workers, slaves, crusaders) could be heard, whole dimensions of new understanding (and perplexity and uncertainty) would be disclosed. The same is true with respect to demographic studies, studies based on census rolls or tax collections, studies that include diaries and newspaper stories and old photographs. Turning the tools and techniques of history to resources of this kind often means opening up new spaces for study, metaphorical spaces sometimes, places for “speculative audacity.” Such efforts may provide experiences of freedom in the study of history, because they unleash imagination in unexpected ways. They draw the mind to what lies beyond the accustomed boundaries and often to what is not yet. They do so as persons become more and more aware of the unanswered questions, the unexplored corners, the nameless faces behind the forgotten windows. These are the obstacles to be transcended if understanding is to be gained. And it is in the transcending, as we have seen, that freedom is often achieved.

The same can be said for the other disciplines and fields of study in the social and natural sciences; and, even among the exact sciences, a heightened curiosity may accompany the growth of feelings of connection between human hands and minds and the objects of study, whether they are rocks or stars of memory cores. Again, it is a matter of questioning and sense-making from a grounded vantage point, an interpretive vantage point, in a way that eventually sheds some light on the commonsense world, in a way that is always perspectival and therefore forever incomplete. The most potent metaphor for this can be found at the end of Melville’s chapter called “Cetology” in the novel Moby Dick. The chapter deals with the essentially futile effort to provide a “systematized exhibition of the whale in his broad genera,” or to classify the constituents of a chaos. And finally:

It was stated at the outset, that this system would not be here, and at once, perfected. You cannot but plainly see that I have kept my word. But now I leave my cetological System standing thus unfinished, even as the great Cathedral of Cologne was left, with the crane still standing upon the top of the uncompleted tower. For small erections may be finished by their first architects; grand ones, true ones, ever leave the copestone to posterity. God keep me
To recognize the role of perspective and vantage point, to recognize at the same time that there are always multiple perspectives and multiple vantage points, is to recognize that no accounting, disciplinary or otherwise, can ever be finished or complete. There is always more. There is always possibility. And this is where the space opens for the pursuit of freedom. Much the same can be said about experiences with art objects—not only literary texts, but music, painting, dance. They have the capacity, when authentically attended to, to enable persons to hear and to see what they would not ordinarily hear and see, to offer visions of consonance and dissonance that are unfamiliar and indeed abnormal, to disclose the incomplete profiles of the world. As importantly, in this context, they have the capacity to defamiliarize experience: to begin with the overly familiar and transfigure it into something different enough to make those who are awakened hear and see.

Generalizations with regard to what forms possess such potential for different people are tempting, but they must be set aside. Jazz and the blues have long had a transformative, often liberating effect on many populations, for example. We have only to read the musical history of our country, recall the stories of our great black musicians, heed such novels as *Invisible Man* (constructed, its author said, according to the patterns of the blues), take note of the importance of jazz in European art forms throughout the century, see how the Jazz Section of the Czech dissident movement has become the live center of dissent. The ways in which the blues have given rise to rock music and what are called “raps” testify as well to a power, not merely to embody and express the suffering of oppressed and constricted lives, but to name them somehow, to identify the gaps between what is and what is longed for, what (if the sphere of freedom is ever developed) will some day come to be.

Recent discoveries of women’s novels, like discoveries of black literature, have certainly affected the vision of those reared in the traditions of so-called “great” literature, as they have the constricted visions of those still confined by outmoded ideas of gender. The growing ability to look at even classical works through new critical lenses has enabled numerous readers, of both genders, to apprehend previously unknown renderings of their lived worlds. Not only have many begun coming to literature with the intent of achieving it as meaningful through realization by means of perspectival readings. Many have begun engaging in what Mikhail Bakhtin called “dialogism,” viewing literary texts as spaces where multiple voices and multiple discourse intersect and interact (1981, pp. 259–422). Even to confront what Bakhtin calls “heteroglossia” in a novel is to enlarge one’s experience with multiplicity of perspectives and, at once, with the spheres that can open in the midst of pluralities.

With *Invisible Man* in mind, we might recall the point that invisibility represents a condition in the mind of the one who encounters the black person and draw implications for the ways we have looked at other strangers, and even for the ways we have looked at those posited as “other” or as enemies. We can find ourselves reading so-called canonical works like *Jane Eyre* and become astonished by a newly grasped interpretation of the “madwoman” imprisoned upstairs in Mr. Rochester’s house. Shocked into a new kind of awareness, we find ourselves pushing back the boundaries again, hearing new voices, exploring new discourses, unearthing new possibilities. We can ponder such works as Tillie Olsen’s “I Stand There Ironing” or “Tell Me a Riddle” and uncover dimensions of oppression, dream, and possibility never suspected before. We can look again at Gabriel Garcia Márquez’s *One Hundred Years of Solitude* and find ourselves opening windows in our experience to startling renderings of time, death, and history that subvert more of our certainties. It is not only, however, in the domains of the hitherto “silent” cultures that transformations of our experience can take place. There is a sense in which the history of any art form carries with it a history of occasions for new visions, new modes of
defamiliarization, at least in cases where artists thrust away the auras, and broke in some way with the past.

It has been clear in music, pushing back the horizons of silence for at least a century, opening new frequencies for ears willing to risk new sounds. It has been true of dance, as pioneers of movement and visual metaphor uncover new possibilities in the human body and therefore for embodied consciousnesses in the world. In painting, it has been dramatically the case. An example can be found in the work of the painter John Constable, who abandoned old paradigms of studio painting and studio light and began sketching his subjects in the open air. Breaking through "horizons of expectation," as the critic Ernst Gombrich writes (1965, p. 34), Constable enabled spectators to perceive green in the landscape, rather than rendering it in the traditional manner in gradations of brown. He defamiliarized the visible world, in effect, making accessible shadings and nuances never suspected before. We can say similar things about numerous visual artists, we are enabled, say, to see them against their forerunners; moving through the "museums without walls," listening to those Merleau-Ponty called the "voices of silence," we can discover ourselves variously on an always-changing place on earth. Giotto, della Francesca, Botticelli, Michelangelo, Raphael, Poussin: The names sound, the doors open to vista after vista. Exemplary for moderns may be Claude Monet making visible the modeling effects of light on objects once seen as solidly and objectively there. Some can recall the multiple studies of haystacks in his garden at different seasons of the year or of Rouen Cathedral at different times of the day. Recalling, we are reminded again how visions of fixity can be transformed, how time itself can take on new meanings for the peceiver, for the one choosing to journey through works of visual art. And we can (we ought to) recall Pablo Picasso’s abrupt expansion of Western observers’ conceptions of humanity and space with his “Demoiselles d’Avignon” and its African and Iberian visages, or his imagining of unendurable pain in “Guernica.”

Of course, such visions are unknown in most of our classrooms; and relatively few people are informed enough or even courageous enough actually to “see.” And it must be acknowledged that, for all their emancipatory potential, the arts cannot be counted on to liberate, to ensure an education for freedom. Nonetheless, for those authentically concerned about the “birth of meaning,” about breaking through the surfaces, about teaching others to “read” their own worlds, art forms must be conceived of as ever-present possibility. They ought not to be treated as decorative, as frivolous. They ought to be, if transformative teaching is our concern, a central part of curriculum, wherever it is devised. How can it be irrelevant, for example, to include such images as those of William Blake, with contraries and paradoxes that make it forever impossible to place the “lamb” and the “tiger” in distinctive universes, to separate the “marriage” from the “hearse”? How can it be of only extracurricular interest to turn to Emily Dickinson, for instance, and find normal views of experience disrupted and transformed? She wrote:

I stepped from plank to plank
So slow and cautiously;
The stars about my head I felt,
About my feet the sea.
I know not but the next
Would be my final inch,—
This gave me that precarious gait
Some call experience.
(1890/1959, p. 166)

The spaces widen in the poem—from plank to plank under an open sky. She identifies experience itself with a “precarious gait”; and the risk involved is emphasized. Reading such a work, we cannot but find our own world somehow defamiliarized. Defamiliarized, it discloses aspects of
experience ordinarily never seen. Critical awareness may be somehow enhanced, as new possibilities open for reflection. Poetry does not offer us empirical or documentary truth, but it enables us to “know” in unique ways. So many poems come to mind, among them W. H. Auden’s “Surgical Ward,” which may emerge from memory because of the AIDS epidemic, or because of a concern about distancing and lack of care. He wrote of the remoteness of those who “are and suffer; that is all they do” and of the isolation of the sufferers compared with those who believe “in the common world of the uninjured and cannot imagine isolation—” (1970, pp. 44–45). Any one of a hundred others might have come to mind: the choice is arbitrary. A writer, like the writer of this book, can only hope to activate the memories of her readers, to awaken, to strike sparks.

The same is true, even more true, when it comes to novels and plays: The occasions for revelation and disclosure are beyond counting. In my train of thought (and readers will locate themselves in their own), I find Antigone, committed to her sense of what is moral and dying for her cause; King Lear, with all artifice and “superfluity” abandoned on the heath in the raging storm. I somehow see Lucifer falling in Paradise Lost and continually falling, reappearing at the end of James Joyce’s A Portrait of the Artist as a Young Man when Stephen Dedalus says, “I will not serve.” And then, remembering Joyce, I hear that resounding “Yes” at the end of Molly Bloom’s soliloquy in Ulysses. In the background, softly, stubbornly, there is Bartleby’s “I prefer not to” in the Melville story; there is the dying Ivan Ilyitch in the Tolstoy story; speaking of himself as “little Vanya” to the peasant holding his legs; there is the shadow of the little girl who hung herself in Dostoevsky’s The Possessed. There are the soldiers described in Malraux’s Man’s Fate, young soldiers about to be executed on the Lithuanian front and forced to take off their trousers in the snow. They begin to sneeze, “and those sneezes were so intensely human in that dawn of execution, that the machine-gunned, instead of firing, waited—waited for life to become less indiscreet” (1936, p. 76). Indiscreet—and I see the house beaten by the storms and the dilapidations of time in the “Time Passes” section of Virginia Woolf’s To the Lighthouse; Willa Cather’s Paul (in “Paul’s Case”) and the winter roses and a boy’s death on the railroad tracks. There are the spare, lace-curtained bedrooms and the slave women in red in Margaret Atwood’s The Handmaid’s Tale; and, in another future, there is the stark transcendence of the rocket in Gravity’s Rainbow by Thomas Pynchon. There is Mark Helprin’s white horse in the snow-bound city in Winter’s Tale, the “air-borne toxic event” in Don DeLillo’s White Noise.

Any reader might go on to recall how, as Herbert Marcuse has put it, “art is committed to that perception of the world which alienates individuals from their functional existence and performance in society” (1978, p. 9). An education for freedom must move beyond function, beyond the subordination of persons to external ends. It must move beyond mere performance to action, which entails the taking of initiatives. This is not meant to imply that aesthetic engagements, because they take place in domains of freedom, separate or alienate learners so fully from the tasks of the world that they become incapacitated for belonging or for membership or for the work itself. Marcuse also spoke of an aesthetic transformation as a “vehicle of recognition,” drawing the perceiver away from “the mystifying power of the given” (1978, p. 72). He was pointing to an emancipatory possibility of relevance for an education in and for freedom. Encounters with the arts alone will not realize it; but the arts will help open the situations that require interpretation, will help disrupt the walls that obscure the spaces, the spheres of freedom to which educators might some day attend.

With situations opening, students may become empowered to engage in some sort of praxis, engaged enough to name the obstacles in the way of their shared becoming. They may at first be identified with the school itself, with the neighborhood, with the family, with fellow-beings in the endangered world. They may be identified with prejudices, rigidities, suppressed violence: All these can petrify or impinge on the sphere of freedom. As Foucault would have it, persons may be made into subjects, docile bodies to be “subjected, used, transformed, and improved” (1977, p. 136). It is not merely the structures of class, race, and gender relations that embody such power and make it felt in classrooms. Much the same can happen through the differential
distribution of knowledge, through a breaking of what is distributed into discrete particles, through an unwarranted classification of a “chaos.”

Having attended to women’s lives and the lives of many strangers, we are aware of the relation between the subjugation of voices and the silencing of memories. All these have often been due to the insidious workings of power or the maintenance of what has been called “hegemony” (Entwistle, 1979, pp. 12–14). Hegemony, as explained by the Italian philosopher Antonio Gramsci, means direction by moral and intellectual persuasion, not by physical coercion. That is what makes it a matter of such concern for those interested in education for freedom. The persuasion is often so quiet, so seductive, so disguised that it renders young people acquiescent to power without their realizing it. The persuasion becomes most effective when the method used obscures what is happening in the learners’ minds. Strangely, the acquiescence, the acceptance, may find expression through dropping out or other modes of alienation, as much as through a bland compliance to what is taken to be the given. This may be because the message or the direction emphasizes an opportunity system or a stratification system offering a limited range of possibilities, apparently attentive to but a few modes of being. This becomes most drastically clear in the case of youngsters whose IQs, according to current testing practices, are low. Ours is not a society that ponders fulfilling options for people with low IQs. Lacking an awareness of alternatives, lacking a vision of realizable possibilities, the young (left unaware of the messages they are given) have no hope of achieving freedom.

In the classroom opened to possibility and at once concerned with inquiry, critiques must be developed that uncover what masquerade as neutral frameworks, or what Rorty calls “a set of rules which will tell us how rational agreement can be reached on what would settle the issue on every point where statements seem to conflict” (1979, p. 315). Teachers, like their students, have to learn to love the questions, as they come to realize that there can be no final agreements or answers, no final commensurability. And we have been talking about stories that open perspectives on communities grounded in trust, flowering by means of dialogue, kept alive in open spaces where freedom can find a place.

Looking back, we can discern individuals in their we-relations with others, inserting themselves in the world by means of projects, embarking on new beginnings in spaces they open themselves. We can recall them—Thomas Jefferson, the Grimké sisters, Susan B. Anthony, Jane Addams, Frederick Douglass, W. E. B. Du Bois, Martin Luther King, John Dewey, Carol Gilligan, Nel Noddings, Mary Daly—opening public spaces where freedom is the mainspring, where people create themselves by acting in concert. For Hannah Arendt, “power corresponds to the human ability . . . to act in concert. Power is never the property of an individual; it belongs to a group and remains in existence only so long as the group keeps together” (1972, p. 143). Power may be thought of, then, as “empowerment,” a condition of possibility for human and political life and, yes, for education as well. But spaces have to be opened in the schools and around the schools; the windows have to let in the fresh air. The poet Mark Strand writes:

It is all in the mind, you say, and has
nothing to do with happiness. The coming of cold,
The coming of heat, the mind has all the time in the world.
You take my arm and say something will happen,
something unusual for which we were always prepared,
like the sun arriving after a day in Asia,
like the moon departing after a night with us.

(1984, p. 126)

And Adrienne Rich, calling a poem “Integrity” and beginning, “A wild patience has taken me this far” (1981, p. 8). There is a need for a wild patience. And, when freedom is the question, it is always a time to begin.

2.4 They’re calling us names

Katrina B. Flores
Katrina B. Flores, “They’re calling us names”

You see they’re calling us names-playing games, keeping us confused.
Identities change every few decades.
More options to check so I can move myself smaller into a box.
Lines drawn all sides around to keep us in because according to their world created mixing is a sin.
Like flashback, walking four deep-fourteen years old in our neighborhood streets.
Migrating dangerously close to the other side.
To their drawn lines of districting.
Not knowing our place is the crime.
Being chased like a fox.
Flashlight bright light in our dark as night eyes.
Pupils dilate with fear of getting stopped and interrogated for being brown in this town.
See you in school . . . not too often chola cuz I’m not going to be looking the fool.
Again getting thrown in the blue room-after school detention-for throwing down for being called a garden tool by some guera chick for wearing the same brown eye liner she bought outlining my voluptuous lips.
No I’m not on the college bound plan . . . Doesn’t seem like you’re ever going to understand why I’m tracked like an animal in sciences of household chores and family because I’m just a baby machine . . . the next pregnant teen drop out.
Because that’s all you’ve seen in me.
You my teacher, you who’s helped me learn that little brown girls with big mouths, big hips and big hair are only good for just one thing—if you know what I mean.
Unless you give me a broom so I can clean your house all SPIC and span.
And my boys-hairnet wearing-butt ends of your jokes stuffed into the kitchens the backrooms.
Let me tell you how it is when everything you say and do counts against you, when it’s a struggle even to come to class.
But you’ll never know what it’s like to be sitting in this room, in this row of desks getting called on as an expert only when we read the two paragraphs about Dr. Martin Luther King Jr. and non-violent protests in our text.
When I tried to learn about my peoples history in building this country you had nothing to feed my mentality and changed the subject hurriedly.
All were trying to do is wipe clean the slate of built up check marks against our names—you can’t even pronounce and you’re telling me to enunciate.
And you wonder why it took until 1997 for my family to go to college?
Just one of us—sent off with all the hopes and dreams of her people in her backpack. Shouldering the weight of the world and not equally prepared because my grandmother never made it past the 5th grade picking grapes, picking cucumbers and cotton. A migrant worker—modern day slave.

And my father had to choose helping provide for his sisters and brothers instead of education to alleviate the immediate risks of starvation. Compounded by the fact he didn’t believe he could make it to another graduation.

He called the first time luck—I call it pushing children through or out of the system where teachers guard the golden gates.

Because you see, all too often La Raza has in the minds of those that teach illiteracy, welfare misusing, illegal, poverty stricken sealed fates.

Commentaries
12 Do you see what I see?

Teacher capacity as vision for education in a democracy

Maureen D. Gillette and
Brian D. Schultz
Northeastern Illinois University

We were asked to write a commentary on teacher capacity based on the framing papers and artifacts in this section. Our commentary is written from our positions as teacher educators at a large, urban state institution that has been characterized as the most ethnically diverse university in the Midwest. In our roles within the College of Education, we prepare teacher candidates for Chicago and the surrounding suburbs. The diversity of this geographic area represents what some would argue are intractable gaps in educational access and outcomes. For example, recent research has documented that only about 30 percent of students graduating from Chicago Public Schools enroll in a four-year college and of that number, only 35 percent graduate (Chicago Consortium for School Research, 2006). Students from families with the highest incomes in Illinois are more likely to attend out-of-state, four-year institutions and are least likely to attend a two-year institution (IERC, 2005). Like our colleagues at other large, urban institutions, this context reminds us on a daily basis of the immediate need to prepare all teacher candidates be educators who understand and are committed to teaching for social justice.

The teacher candidates with whom we work mirror the diversity found in today’s P-12 schools. Many attended under-resourced urban schools and struggled academically upon entrance into college. As a designated Hispanic-serving institution, many of our candidates began their own schooling in the United States unable to speak English. A significant number of them work full-time by necessity, have immediate and extended families to support, and are older than traditional undergraduates. We are keenly aware of immigration issues as some of our students are undocumented. Our teacher candidates are typically the first in their family to attend college. Because most work and attend school part-time, it is not unusual to find that some of our students take eight or more years to graduate, a timeline that is not only acceptable to them but may be one that is essential to their success. This portion of our teacher candidate population is often unaware of the type resources available in nearby wealthy districts and thus does not have first-hand knowledge of the magnitude of the inequities that existing between school districts across our geographic area.

At the same time, we have a large number of suburban students who grew up in nearby middle or upper-class homes. They may never have developed a strong relationship with peers who do not share their ethnic and socioeconomic characteristics. Many are fearful of completing clinical experiences in an urban school and often argue that it is unnecessary for them to do so because they have no intention of teaching in city schools. For instance, when reading Kozol’s (2005) *The Shame of the Nation: The Restoration of Apartheid in Schooling in America* as a required text for a course, many of the students from this demographic do not believe that the conditions Kozol describes actually exist in
schools, even though some of the data and anecdotes in the book were collected in the Chicago Public Schools.

We see first-hand every day that developing teacher capacities for social justice is not just an enterprise for candidates intending to teach in urban or rural poverty areas, but an imperative for all teacher candidates. We have an obligation to foster teachers who are committed to social justice and have the knowledge, skills, and dispositions to work toward equitable access and outcomes for all, regardless of where or who they teach. In this chapter, we elaborate on two salient characteristics of teacher education programs raised by the framing papers: the commitment to inquiry-based critical pedagogy and the development of communities of practice. We use these points to argue for a specific type of “teacher vision,” one that is rooted in social justice. As an aspect of teacher capacity we believe this is essential to the development of teachers who can and will prepare all young people for meaningful participation in our society.

THE ROLE OF VISION IN DEVELOPING TEACHER CAPACITY FOR EMANCIPATORY EDUCATION

The framing papers in this section can be synthesized and seen through a conceptual lens of teacher vision. The comprehensive book, Teachers for a Changing World: What Teachers Should Learn and Be Able To Do (Darling-Hammond & Bransford, 2005), contains a chapter entitled, “How Teachers Learn and Develop” (Hammerness et al., 2005) that underscores the importance of new teachers learning to teach in a community that enables them to develop a vision for practice (pp. 385–386). Vision, or imaging what is possible, is seen by these researchers as an essential component of overcoming the “apprenticeship of observation” that has long been recognized as a roadblock to emancipatory teaching. The model developed by Hammerness et al. (2005) places teacher vision at the center of a large, outer circle that represents the “learning community.” This exemplifies the optimal situation for teacher development. Surrounding the “vision” centerpiece are four key, yet general concepts that align with those described in the framing papers: Understanding, Practices, Dispositions, and Tools. Understanding is defined as “deep knowledge of content, pedagogy, students, and social contexts.” The “Developing, practicing, and enacting a beginning repertoire” comprises Practice. Dispositions includes “habits of thinking and action regarding children and teaching,” and Tools encompasses the conceptual and practical resources that teachers must have to be effective (p. 386).

The Hammerness et al. model, as presented, does not speak specifically to the types of knowledge, the forms of practice, the specific dispositions, or the appropriate tools that might help teacher candidates develop their own social justice teacher vision. We believe this vision for justice-oriented teaching is central, as well as critical, to addressing the question of teacher capacity today. The specific knowledge, understandings, practices, dispositions, and tools for social justice teaching discussed in the framing papers can be used to describe teacher vision for emancipatory teaching. We believe it is necessary for teacher candidates to develop such a imagination for what is possible. They not only need the capacity to see that which they may initially struggle to operationalize, they need a commitment to equity and a trust in themselves and their students in order to take the risks necessary to eventually succeed.

Teacher candidates need to see and analyze models of teaching that embody social justice teaching that reflect such vision. In doing so, they can be guided to develop, implement, and reflect on enactments of their own vision to move beyond traditional
classroom practices that, as James Baldwin (1963) noted in *A Talk to Teachers*, maintain the status quo in society rather than develop in students the capacity for critical thought and action. Further, they can learn effective ways to interrupt those practices, policies, and procedures that have exacerbated current gaps in educational access and outcome.

**TEACHER CAPACITY FOR SOCIAL JUSTICE AS A DEVELOPMENTAL, COLLABORATIVE, COMMUNITY-ORIENTED PROCESS**

Helping candidates develop a vision for teaching with social justice at the core or foundation cannot be accomplished within programs and courses where components and people are in isolation. Appropriately, the model presented by Hammerness *et al.* (2005) places the Understandings, Practices, Dispositions, and Tools within a larger circle that represents the “learning community.” The concept of learning community is broad and deep in regards to preparing teachers for social justice. As McDiarmid and Clevenger-Bright pointed out in their framing paper, teacher education is developmental, beginning when candidates enter college and continuing through the life-cycle of teaching. When teacher development for social justice is viewed on such a continuum, the need for collaboration between multiple constituencies within the context of a learning community becomes clear. Teacher educators have long known that teacher capacity cannot be built within teacher preparation programs alone. It is incumbent upon teacher educators to build such communities throughout the university career of prospective teachers as well as to create those connections in P-12 schools. What, then, is necessary in order to model for candidates the type of collaborative, democratic practice we espouse? How can we create and then deconstruct campus and classroom experiences that are illustrative of our vision of democratic practice so that our candidates learn how to do the same in their own P-12 classrooms?

The framing papers briefly addressed the need for collaboration between faculty in teacher education and those in the liberal arts and sciences. Teacher candidates must develop a content-knowledge base that is multicultural, come to see themselves as cultural beings with a plurality of identities, develop the type of critical thinking and analytic skills necessary for problem-posing, critical inquiry, and reflective thinking, and acquire the skills necessary to help P-12 students succeed (e.g. technological competence, community-based learning). The foundation for these competencies must be set within the liberal arts and it must be done in collaboration with education faculty. Additionally, many teacher educators will need to consider forging partnerships with community college colleagues where many of our candidates get their general education and beginning teacher education course work.

To make this collaboration both a tool for modeling and a reality, teacher educators must engage their liberal arts and science colleagues in discussions about teacher capacity. They must share their mission and vision for teacher preparation. Teacher educators must be able to clearly articulate the conceptual underpinnings of their programs. Questions about the perspectives and emphases in the general education curriculum and the major or minor areas of study must be raised and discussions invited. They must be willing to explore areas of congruence and dissonance between and within the university-wide components of teacher-education programs. It means that, for example, models of effective practice in team-teaching, collaborative student research, and integrated, student-centered curriculum and pedagogy must be exemplified between and among faculty from diverse disciplines. Perhaps one type of learning community that would lead
students to develop a vision for critical pedagogy might be represented by a partnership between liberal arts and sciences, teacher candidates, and teacher education faculty.

The faculty who prepare candidates are themselves often compartmentalized into departments or areas that fail to create a learning community within schools or colleges of education. Programs are typically comprised of isolated course work in educational foundations, educational psychology, curriculum and methods, and field experiences. Faculty members hold beliefs about teacher capacity and the purpose of teacher education that are not shared, discussed, debated, and deliberated with colleagues. How do schools, departments, and colleges of education foster teacher vision for democratic community by themselves operating as a disconnected learning community? How is vision developed by teacher educators themselves? How often are candidates engaged in intellectual, social, or professional endeavors with faculty and administrators from across the college or university? In order for candidates to develop a vision of classroom community where teachers and students are partners in the learning journey, they must see it modeled and should participate in such experiences at the campus level as well as in the classroom.

Another aspect noted by the framing papers was the importance of collaboration with P-12 partners. It is typically assumed that in clinical teacher preparation, the primary learning community is comprised of teacher candidates, P-12 students, cooperating teachers, and university supervisors. It is rare to hear teacher educators discussing the candidate's learning community in a broader context that might include other teacher education faculty, liberal arts and sciences faculty, school administrators, parents, and other community members. While research underscores the importance of the principal as instructional leader in high-achieving schools, schools where community-building is a priority, and schools where teachers feel valued and affirmed, there is very little evidence outside of the professional development school literature that indicates that building and district administrators are included in preservice learning communities. Further, this is especially the case of parents and other community members. Research on the perceptions of first-year teachers about their preparation indicates that one area where they believe they were least prepared is in working with administrators and parents (IADPCE, 2005). Candidates must develop a vision of education that is community-based, one where parents and administrators are allies.

Collaboration in teacher education can and should exist in some form or another in colleges and universities. The challenge is to begin considering strategies for altering traditional boundaries and practices in our own settings. Mandates such as teacher standardized test score reporting and federal and state requests for grant proposals requiring various partnerships have raised the prominence of teacher education on many campuses, but it is fair to say that it is currently not the developmental, collaborative process that we suggest in this section. We cannot expect candidates to envision democratic practice nor come to understand implementation strategies if they do not see it, experience it, and participate in guided deconstruction of such experiences.

TEACHER VISION FOR AN INQUIRY-BASED, STUDENT-CENTERED, CRITICAL PEDAGOGY

The final section of our commentary raises questions about three areas of the teacher education that we believe are essential components of the development of teacher vision for social justice: curriculum, foundations, and the moral impulse. All three areas were addressed by the framing papers but we raise the following questions within the
context of our argument that the type of capacities we are advocating must be built within communities of learners if candidates are to transfer their vision into pedagogical action.

The capacity to envision curriculum and curriculum development as tools of emancipation for learners requires teacher candidates to understand and be willing to confront, critique, and subsequently deconstruct the traditional power structure of the classroom. Candidates must have faith in democratic practice and trust in a student-centered model in order to find out through practice that powerful, student-centered curriculum will engage learners and that learners can be partners in curriculum development. This trust is difficult to develop when school administrators and outside societal pressures, especially in urban areas, place increasing emphasis on control rather than emancipation of learners. In learning communities where teacher education faculty, candidates, teachers and administrators have support for risk-taking and experimentation, it is possible to ask the types of questions that help structure democratic vision and facilitate trust in the process. Such organizational questions might be: How can Schwab’s (1969) commonplaces of curriculum (subject matter, teacher, students, milieu) contribute to what will motivate and “work” successfully in a given classroom? How can meaningful, engaged curricula that is both justice-oriented and standards-aligned be developed and encouraged? How does a teacher’s vision account for and encompass what may be called inverted curriculum (Schultz, 2008), null curriculum (Eisner, 1994) or out-of-school curriculum (Schubert, 1986) and make such concepts and strategies a part of an explicit classroom curriculum? What is it that allows for the creation of rich curriculum in under-resourced schools? How can teachers come to see students as curricularists (Schubert, 1992)? How can social action be seen as curriculum and curriculum be one of social action (Schultz & Oyler, 2006)?

The foundational aspects of education are often seen as useless by teacher candidates. Many candidates leave foundational course work unable to connect the historical, philosophical, sociocultural, and political dimensions of education to their role in the classroom. How do we assist candidates in developing a vision that is underpinned by a foundational context in order to justify their ideas and ideals about what is possible? How do candidates come to understand that the attainment of their vision is an evolutionary process, one that can be informed by scholarly examination of the social justice vision of others who have come before them? How do teacher educators and teacher candidates share the foundational dimensions of their vision? When do teacher candidates get opportunities to hear from exemplar teachers who are committed to equity about the theories and philosophies that drive their daily practice?

We consider these questions an entrée to understanding moral aspects of teacher vision. The moral aspects encompass democratic, emancipatory, and community-oriented impulses. These impulses enable effective teachers to take action challenging the status quo and interrupting conventional practices when those practices do not lead to more equitable educational outcomes. A vision for social justice is a necessary foundation, but vision without the courage and support to act will perpetuate the state of affairs that currently exists. How do self-awareness, identity, and culture play a role in the translating vision to action? How are reflection and action, for students and the teacher, encompassed within teacher vision? How are justice themes rooted in the idea of vision-based classroom action (Kesson & Oyler, 1999)? How do candidates come to see teaching as a moral action and ethical enterprise (Ayers, 2004)?
CONCLUSION

The gospel song *Faith* by God’s Property (1997) contains the refrain, “I can do the impossible, I can see the invisible.” These lyrics describe the foundation of teacher vision for social justice. It is the capacity to envision learners and learning experiences in ways that they may never have experienced during the “apprenticeship of observation.” Teacher educators must also develop the same capacity in order to develop new models for practice and structures for implementation.

Our task in this commentary was to add to the discussion on teacher capacity by reflecting on the framing papers and artifacts included in this section in light of our own beliefs about teacher capacity. Our focus has been on the need to help our candidates develop the capacity for a specific vision, one of democratic education rooted in social justice. We cannot help but note that those teachers we know who teach with such vision exhibit those characteristics that Paulo Freire enumerated in his Fourth Letter: humility, courage, tolerance, decisiveness, security, patience/impatience, and joy of living. These teachers love their job and continue to work in high-need schools year after year because they can see their students as successful adults. They understand that all parents want their children to be successful, even though they may not be know how or be able to help them attain that success. These teachers come back day after day in difficult situations because they believe that they can make a difference in the lives of the children and in society by teaching the young people who sit before them each day to be critical thinkers and actors. They hold a student-centered vision for collaborative, emancipatory learning environments. They understand that attaining their vision is an ongoing process that is created and recreated with students, colleagues, parents, and the community. They espouse and enact their vision and that vision sustains them as lifelong educators.

Teacher educators must develop a vision of emancipatory teacher education practice and act on that vision through the creation of communities of practice that include our partners in the liberal arts, in the schools, and in our communities. We must be willing to practice what we preach if we expect to foster the capacities described in the framing papers in our teacher candidates.

In James Baldwin’s (1963), *A Talk To Teachers*, he states, “I don’t think anyone can doubt that in this country today we are menaced—in intolerably menaced—by a lack of vision.” He notes that it is inconceivable that people continued, during the horror of incidents such as the Birmingham Sunday School bombing, to say, “I can’t do anything about it. It’s the government.” It seems to us that in many ways, the country is gripped by the same type of feeling about education today and that we, as teacher educators, may be complicit. We look at the problems in high-need schools and tell ourselves that the issues are complex. We say that we are addressing teacher capacity for democratic education in our courses but it’s the “adjuncts” or the “liberal arts faculty” or the “schools” or “bureaucracy” that thwart our efforts. If we are serious about fostering an environment that encourages our teacher candidates to take action and teach for change in the roles as teachers, we must not only facilitate environments that encourage such practice, but also model what we envision in our own daily practice as teacher educators.

13 Partial movements toward teacher quality . . . and their potential for advancing social justice

Kevin K. Kumashiro
University of Illinois-Chicago

At a time when official discourses in the United States are narrowly defining teacher quality, it is helpful to be reminded that the field of teacher education has long grappled with the notion that teacher quality cannot be defined independently of the context—and the oppressive as well as anti-oppressive movements within that context—in which the teaching occurs. The framing papers and artifacts in this section not only serve as this reminder, but as well, suggest to me at least three enduring and provocative questions about the necessary and troubling relation between teacher quality and (anti)oppressive movement in schools and society.

HOW IS TEACHING NECESSARILY PARTIAL, AND HOW CAN PARTIALITY BE USED TO ADVANCE SOCIAL JUSTICE?

The papers and artifacts in this section illustrate how teaching is not a neutral act. What gets taught is framed by only certain people using certain criteria to include certain things according to only certain perspectives in the curriculum. Similarly, how that then gets taught makes use of selected instructional methods that favor some learning styles over others and that strive towards only some pedagogical goals. Saying what and how to teach simultaneously requires saying what and how not to teach. Even with the best of intentions, teaching cannot help but to be partial.

Yet, current movements to reform education often overlook this necessary partiality of teaching. Currently in the United States, for example, the official discourse on improving teacher quality, as reflected in federal legislation (i.e. No Child Left Behind) and agencies (such as the U.S. Department of Education’s Institute of Education Sciences), suggests that learning to teach means learning to use only those instructional methods that somehow have been proven to be effective in raising student achievement (as exemplified by the What Works Clearinghouse, established by IES to provide “scientific evidence” of what works in education), despite competing visions of what it is that schools should be working towards, and despite questions raised about the methods used to evaluate what works.

This official discourse of how to teach (via methods that “work”) is not unlike the official discourse of what to teach, i.e. the “official knowledge” of schools that often becomes institutionalized as standards for learning, as what all students should know and be able to do. Both discourses are partial—reflecting only certain perspectives, advancing only certain goals, enabling only certain kinds of learning and growth. This narrowing of what and how to teach can be viewed as assimilationist when it demands conformity (think like this, teach like this, perform like this) while hindering opportunities to think outside the box and challenge the status quo via alternative perspectives, alternative methods, even alternative goals.
Calls to be more inclusive cannot solve this problem since full inclusion is not possible—there will always be things that get left out or prevented from coming in, intentionally or not. Even initiatives from within the profession to improve teacher quality and teacher education—embodied by such organizations or programs as the National Council for Accreditation of Teacher Education and the National Board for Professional Teaching Standards, and leaders who identify as social justice advocates—leave some teacher educators feeling that the professional requirements they put forth regarding what and how to teach teachers (or what/how to demonstrate what/how teachers learned) can and do hinder anti-oppressive education. Why? Because the requirements are partial, and problematically so, particularly when they presume to say what it means to engage in anti-oppressive approaches to education, and more importantly, when they simultaneously raise barriers to engaging in competing approaches.

This is not to say that there should not be standards. Standards, after all, make explicit the knowledge, skills, and dispositions that are valued in schools and society, as well as the unspoken rules or assumptions or practices for succeeding and getting ahead. But there are different ways to talk about the standards. Teaching to standards should not mean teaching that this is how things are and should be. Teaching to standards must involve teaching about the partiality of those very standards. It must involve teaching how any set of standards, or any curriculum, or any teaching and learning moment, is partial, is framed by only certain questions, is able to include some things but must exclude others, is helpful for achieving certain goals but a hindrance to achieving others. Any lesson, for example, will both include and exclude certain perspectives, will favor some interests over others, will challenge some inequities but reinforce others, will raise some questions or insights but mask others. Across the spectrum of grade level, subject matter, and cultural context, students need to see these partialities. And teachers need to treat these partialities not as things that make a lesson a failure, or ineffective for teaching and learning, but rather, as the very things that can make anti-oppressive education possible. Teaching students to think independently means teaching students to see that every lesson—even with the best of intent—is partial, and that this partiality will always have (educational, material, political) consequence.

Quality teachers need certain knowledge, but also need to know the limits of their knowledge. They need certain skills, but also need the skill of troubling whatever they do. They need certain dispositions, but also need to be disposed to uncomfortable changes in these very dispositions. Anti-oppressive teaching and teacher education are as partial as other forms of teaching and teacher education, but they make use of that partiality in ways that are uncommon, unsettling, even paradoxical.

**HOW IS TEACHING PARADOXICAL, AND HOW CAN PARADOX SUGGEST DIFFERENT METAPHORS FOR TEACHING?**

The partiality of teaching makes the process of teaching (and of learning) paradoxical, and necessarily so: It requires that teaching and learning aim to trouble the very things being taught and learned, and the very ways that the teaching/learning are happening. This does not mean that learners reject everything that they are learning; rather, it means that they examine how everything that they learn is partial, and how this partiality always has consequence. This metaphor of troubling contrasts with metaphors that currently frame dominant discourses of teacher quality. Examples of dominant metaphors include metaphors of repetition, transmission, and accumulation that are akin to Paulo Freire’s characterization of “banking education,” as is apparent when expecting that
quality teachers will delineate what all students (or student teachers) should know and be able to do (via standards); will use instructional methods that transmit this effectively (via “what works”); and will assess that students (or student teachers) indeed acquired what they were to learn (via high achievement on standardized assessments). This is not to say that anti-oppressive teaching involves avoiding standards, or methods that “work,” or standardized assessments, as if such avoidance were even possible. Rather, anti-oppressive teaching involves simultaneously engaging in and challenging how we commonly think of “teaching”; it involves engaging in and challenging what I noted earlier to be its own assimilationist moves. And therein lies the paradox.

Teaching is paradoxical because it is both excessive and subtractive. Teaching is excessive in the sense that it always includes or accomplishes more than what was intended. And, given that learners will always view and respond to what is being taught in multiple and unpredictable ways (because they view themselves and the world through various “lenses” that have been colored by their unique histories and identities and experiences and prior learnings), teaching can never be foretold or contained, and it can even contradict what it aimed to accomplish. Teaching is also subtractive, not merely “subtractive” in the sense that it disadvantages the students academically (although such a form of subtractive schooling indeed characterizes what too often is happening in schools), but also “subtractive” in the sense that it takes away from what the teacher is teaching, or what the learner already thought was learned, or even how the learner has come to make sense of and feel about him/herself. Teaching/learning involves not only gaining something, but also losing something. And this subtractive relation can be anti-oppressive when it troubles the identities and knowledge that help to maintain the status quo.

It is in this loss, in this process of raising challenging questions, that teaching and learning should expect to coincide with discomfort, particularly if the knowledge being troubled is knowledge about oneself or one’s relation to others or the world in which one lives. After all, learning that the very ways we make sense of the world is partial, and this partiality can have harmful consequence, can be an upsetting process. Yet, in school, space is not always opened up for such discomfort. Too often, teachers seem to hope that discomfort does not arise in their teaching (as when talking about racism and hoping that crisis does not erupt), and then overlook discomfort when it inevitably arises. This is a problem because discomfort is not something that often leads a learner to want to learn more, to want to ask even more troubling questions. Discomfort can lead to resistance to further learning. Thus, it is important for teachers to learn how to structure learning such that students anticipate discomfort and are able to find ways to work through it so that they continue learning. Teachers need to come to view discomfort as a part of learning that is not only unavoidable, but also potentially productive.

Teacher education does not often prepare teachers for addressing discomfort in this way. And perhaps this is because teacher educators, themselves, are not often prepared for it.

HOW IS TEACHING HINDERED BY RESISTANCE WITHIN TEACHER EDUCATION, AND HOW CAN WE BRING ABOUT CHANGE?

More and more teacher education programs are teaching about anti-oppressive approaches to education (including approaches that are multicultural, critical, feminist, and queer), but barriers persist in getting such approaches into K-12 schools. Some barriers come from the structure of the teaching contexts (such as requirements to teach
only certain things in only certain ways), and some from the teachers themselves (as when believing that the teachings of the university are out of touch with the realities of schools). But some barriers come in the form of mixed messages from within teacher education, as when teacher educators do not trouble their own partialities, and in the process, indirectly and, perhaps, unintentionally model a resistance to and impossibility of putting anti-oppressive theory into practice.

An example would be the message of hypocrisy. Such was the criticism about the field of teacher education when some teacher educators spoke out against the Passport to Teaching, a program of the American Board for Certification of Teaching Excellence (ABCTE), with substantial funding by the federal government, that would award initial teacher certification based almost entirely on content knowledge (as demonstrated in a standardized test). In 2004, ABCTE was picking up steam, on its way to getting five states to adopt the Passport in some form, and scheduled to make a bid for a sixth state, California. A coalition of teacher educators, K-12 educators, and community activists spoke through letters, testimonies, media releases, e-mails, and other outlets to make clear to leaders and the public how the Passport would not increase the number of quality teachers because it did not provide a mechanism for teacher candidates to learn about and develop skills in teaching the subject matter, particularly to a diverse student population with a range of needs, learning styles, and cultural influences. Quality or effective teachers must not only know the content, but also be skilled in how to teach the content, and the Passport did not ensure such skills. The Passport was not adopted by CA, but the struggle left a lingering question in the minds of some observers, who asked why teacher educators were arguing that educators in K-12 schools must formally learn how to teach before being hired when teacher educators themselves (and other educators in colleges and universities) do not face a similar requirement. Teacher educators may be experts in their context (as represented in their earning a Ph.D.) but their criticism of ABCTE was precisely that content knowledge alone does not make for teacher quality. By not institutionalizing their own learning of how to teach, teacher educators seemed resistant to troubling their own teaching.

Of course, a growing number of teacher educators are arguing that teacher educators, too, should be formally learning how to teach. But there are challenges: opportunities for professional development on teaching are rare, rewards are few (as in the tenure process), and resistance is strong (among those who value their independence). A philosophical challenge also exists to institutionalizing that type of professional development, namely, the lack of consensus, even among education scholars, on what exactly it means to learn to teach, be it “effectively” or “anti-oppressively” or otherwise. Presumably, learning to teach would mean learning to teach in ways that contrast what is traditionally or commonly done, or what common sense would have us believe should be done—i.e. the whole point of learning to teach is to learn not to rely on tradition or common sense. This turn to alternatives is important if traditional or common ways of teaching are deemed to be ineffective, either in raising student achievement (as reflected in standardized tests), in managing the classroom (as is often a primary challenge of and concern for beginning teachers), or even in advancing social justice through critical consciousness and engagement. But who defines the alternative? And how does that definition, which cannot help but to be partial, necessarily lead to problematic consequences? There are competing ways of defining what is ineffective and what is desired. Are those groups that are currently driving education reform by institutionalizing their perspectives into policy, including and especially those who identify as advocates for social justice, acknowledging their own partiality, and institutionalizing ways to trouble it?

Policies and practices in teacher education are no less partial than those in K-12
schools, no less likely to have both oppressive and anti-oppressive consequence, and thus, are in no less need of bring troubled. As the field of teacher education continues to grapple with the question of teacher quality in K-12 schools, we in teacher education should continue to bring the questions and insights of this grappling to bear on ourselves and our ongoing work. This new handbook is an important resource for doing this, and I look forward to seeing the changes that we make happen.
14 Dismantling dichotomies in teacher education

INTRODUCTION

For more than forty years, the achievement gap between middle-class, white students and students of color has persisted. At the turn of the twenty-first century, the average African American or Latino high school student performs at about the level of an eighth grade white student in reading and mathematics (Resnick, 2004). The lower achievement of minority and poor students results from numerous factors: for example, they are more likely to attend poorly resourced schools, to be taught by uncertified teachers, to encounter lower teacher expectations and rote curriculum, and experience a revolving door of teachers. In addition, they face higher drop out rates, higher rates of suspension, and higher rates of placement in special education than their white middle class peers (e.g. Anyon, 1997; Darling-Hammond, 1995; Jacobsen et al., 2001; Lankford et al., 2002).

Increasingly, educational scholars of all stripes agree that teacher quality is critical to improving access to intellectually rigorous content and ultimately, to efforts to narrow the achievement gap. Less clear, however, is how we might select, prepare, and support teachers to meet this challenge, and how we might define the capacity teachers require to narrow the gap. In this chapter, we conceptualize teacher capacity as less about distinct forms of knowledge and belief than about classroom practices, emphasizing the importance of integrating theoretical principles with the enactment of practice in the preparation of teachers.

DANGEROUS DICHOTOMIES

The current debate on teacher capacities has a curious dichotomy at its core. While teacher educators proclaim the need to prepare teachers to teach for social justice (e.g. Cochran-Smith, 2004; Grant & Agosto, this volume; Howard & Aleman, this volume), critics of teacher education decry the lack of attention to teachers’ preparation to teach subject matter knowledge (e.g. Will, 2006). With a few notable exceptions (e.g. Au, 1980; Boaler, 1997; Lee, 1995; Gutstein et al., 1997; Moses & Cobb, 2001; Warren et al., 2001),
researchers in multicultural education rarely reference the teaching of subject matter. On the other hand, those who study the teaching of subject matter often overlook issues of race, language, and class.

This dichotomy has deep roots, as McDiarmid and Clevenger-Bright (this volume) illustrate. And as Dewey long ago observed, such educational dichotomies (content versus process; child versus curriculum) are rarely useful and often dangerous. We argue that re-conceptualizing teacher capacity, particularly with regard to reducing educational inequality, requires dismantling this particular dichotomy. Carol Lee (1995) demonstrated the value of scaffolding from African American students’ cultural knowledge in order to help them read complex literary texts; in her work culturally-relevant pedagogy targets deep disciplinary understandings of literature. In mathematics, Gutstein and his colleagues (1997) observed effective mathematics teachers in the Mexican American community provide students with tools for active participation in society through the teaching of mathematics content. Consistent with this line of work, we propose a model of teacher capacity that views preparing teachers to teach subject matter well and teaching for social justice as interdependent.

Talking about teaching for social justice without addressing the importance of content is like giving people the right to vote without handing them a ballot—the substance is missing. As Freire recognized long ago, the pedagogy of the oppressed is centrally about empowering students as readers, writers, and thinkers; literacy is at the core of Freire’s early work (1970). In arguing for algebra as the new civil right, Bob Moses makes a similar claim about the centrality of content in addressing educational inequality. Reducing educational inequality means taking on the challenge to prepare students from historically oppressed groups to tackle intellectually ambitious subject matter in mathematics, science, history, and literature, among other areas. It is not enough to prepare teachers with the dispositions to teach all students, or with knowledge of their students’ cultural and linguistic resources. Teachers need to know how to use such knowledge in order to help students develop intellectual skills and to succeed academically.

Teaching reading well requires professional knowledge, skill, craft, professional judgment, and the ability to use curricular resources (Snow et al., 2005). We know more than ever before about approaches to teaching early reading to prevent reading problems (Snow et al., 1998), yet we can’t be sure that all prospective teachers have the opportunity to develop their ability to teach reading well, especially in settings where many children struggle with reading. This may require teacher educators to rethink how they prepare novices to teach in high-poverty schools. Not preparing teachers to teach decoding or phonemic awareness right along with approaches that focus on the meaning of text, simply perpetuates inequality (Delpit, 1996). Not preparing novice teachers to use and adapt the kinds of curriculum materials that are increasingly being mandated in high-poverty schools is irresponsible. Teacher educators may rail against the limitations of Open Court, for example, but they have a professional responsibility to ensure that novices learn to use such curricula to promote student learning, even as they work to change policy. Otherwise, we risk preparing teachers for schools that do not exist rather than preparing them to negotiate the expectations that they will meet in today’s schools. By choosing to ignore these expectations, we fail both the students, and the teachers who teach them.

At the same time, policies that prevent students in high-poverty schools from engaging in more sophisticated forms of literacy (including interpretation, extended writing and analysis) because of their exclusive focus on easily tested basic skills, also perpetuate inequality. For example, scholars suggest that although the academic achievement gap in reading has narrowed for students in the early grades, the gap persists as students enter
middle and high schools where literacy achievement demands greater knowledge and understanding of content (Hirsch, 2006). Preparing teachers to teach for social justice requires that novices develop intellectually ambitious goals for their students and learn ways to enact these teaching goals in their classrooms. As Megan Franke of Center X teaches her novice teachers, even in the most rigid of pacing plans, there is room to attend to and develop students’ conceptual understanding of mathematics. But novices must learn not only that this kind of intellectually ambitious teaching is possible—they must learn to enact these practices in their classrooms, a challenge we take up below.

Teaching reading well is also a matter of experience. No matter how well we prepare teachers initially, much of their learning will be on the job. Placing the least experienced teachers with the most needy students—what we routinely do now—ensures social injustice. To talk seriously about teacher capacity is to acknowledge the continuum of teacher learning (Feiman-Nemser, 2001) and the differential kinds of support that teachers need throughout their careers. Getting serious about supporting the learning of new teachers means changing entrenched policies that place the least experienced teachers in the most challenging settings.

A FOCUS ON PRACTICES ACROSS THE CURRICULUM

Teaching for social justice must happen through the teaching of subject matter. But learning how to help struggling students succeed in algebra or read *Beloved* is no simple task for teachers. To teach effectively, teachers must develop both conceptual and practical tools. Conceptual tools are the principles, frameworks, or guidelines that teachers use to guide their decisions about teaching and learning (Grossman *et al.*, 1999). These tools may include general, applicable theories such as constructivist theories of learning, motivation, and instructional scaffolding or more philosophical views related to the purposes of schooling such as social justice and the goal of improving educational opportunities for students. Conceptual tools facilitate teachers’ framing and interpretations of practice, but they do not offer specific solutions for negotiating the dilemmas that arise in interactions with students. Practical tools encompass the kinds of practices, strategies, and relationships that teachers can enact in classrooms as they strive to accommodate the needs of students and challenge them with intellectually, rigorous content. To paraphrase a debate between Nate Gage and Lee Shulman, two venerable researchers of teaching, without practical tools, teachers may be lost in thought; without conceptual tools to make sense of practice, teachers may be missing in action.

From this perspective, increasing teachers’ capacity requires the development of both conceptual and practical tools. For example, proponents of preparing teachers for social justice argue that teachers’ ability to accommodate the cultural and community resources students bring with them to school is an important principle for teachers to learn (cf. Gandara, 2002; Ladson-Billings, 1997; Moll *et al*., 1992). In order for new teachers to enact that principle in the context of their work with students, however, they must also cultivate classroom practices for identifying students’ cultural and community resources as well as adapting subject matter curriculum and instruction to build on and draw from those resources (e.g. Richert, 2006). Similarly, given the increasing number of English language learners in many of today’s urban public schools, teachers must not only understand the particular language needs of English learners, but have access to practices that enable them to address those needs in the context of subject matter instruction. Abstract knowledge of either students’ needs or ways to address them will not suffice; teachers also need opportunities to try out and refine practices that embody such knowledge.
Without opportunities to develop and refine practices for the teaching of specific subject matter areas to minority and poor students, teachers’ capacities to provide high quality learning opportunities for their students are severely limited.

UNDOING DICHOTOMIES IN TEACHER EDUCATION

The conception of teacher capacity put forward in this commentary requires three fundamental shifts in emphasis to be made on the part of teacher educators: first, that teacher educators work to develop programs that undo the dichotomies between subject matter and social justice; second, that they focus upon helping novices develop and refine practices; and finally, that they prepare teachers explicitly for the schools attended by our lowest achieving students. While these alterations may not represent wholecloth reform, they are also difficult changes to make. They necessitate shifts in focus both at the course and program level as well as in the field.

Such an effort, for example, may require blurring curricular lines between what are typically called “foundations” courses and those that focus on “methods” or teaching (Howard, this volume). Foundational courses in multicultural education, for instance, may need to go beyond their focus upon conceptual understandings of racism, injustice, or urban schools. They must not only help novices understand the presence of inequities in our schools and understand what it means to support a “socially just” educational system; they also need to help prospective teachers develop a set of specific classroom practices that will help them succeed with students from historically oppressed groups. And in turn, methods courses that have typically focused upon teaching subject matter must also address issues of inequity directly, through introducing students to the practices associated with teaching intellectually ambitious subject matter to historically underserved children.

In this new framing of teacher preparation, methods courses are not only inherently about subject matter and the methods of teaching—about classroom practices—but also deeply about teaching for social justice. And in this new framing of teacher preparation, foundations courses are not only inherently about conceptual tools, but also come to represent a deep form of learning about practices. In her study of how two teacher education programs prepare new teachers for diversity, McDonald (2005) describes one particular course that provides an interesting example of how a carefully structured course can help new teachers develop practices for teaching English language learners. This course, focused on the teaching of English language learners, skillfully provided prospective teachers with broad principles for making decisions about how best to teach ELLs as well as specific strategies for doing so. For example, the instructor stressed the importance of accommodating ELLs’ literacy needs but also walked prospective teachers through specific adaptations to the strategy of reciprocal teaching as a specific tool aimed at supporting ELLS in the classroom. Prospective teachers in this class repeatedly commented that they learned not only how to think about English Language Learners, but also how to teach them. This example points to the possibility and the potential power of providing prospective teachers with opportunities to develop both concepts and practices for teaching specific types of students within the context of teacher education.

Finally this new conception of teacher preparation may require that teacher educators prepare teachers for classrooms and schools as they are, while still giving prospective teachers opportunities to consider what they could become. While it is imperative that new teachers are supported in developing powerful images of good teaching, it is also
unfair to prepare new teachers to expect to enact their ideals immediately. To do so, may in fact, set new teachers up for disappointment and increase the risk that they leave the profession (e.g. Achinstein et al., 2006). As Hargreaves and Jacka (1999) argue: “Initial teacher education may increasingly be a process of soft seduction into images and practices of teaching that prepare new teachers neither to adjust to the unchanged realities of the schools in which they will begin their paid teaching careers, nor to develop the intellectual understanding and political skills which would enable them to critique and challenge those realities” (p. 58). This may mean achieving a delicate balance in teacher education between preparing new teachers for schools as they might be and acknowledging and thoroughly preparing teachers for schools as they are; to achieve this balance might also require developing what Freire terms a patient impatience (p. 64). For example, teacher educators must not only offer novice teachers skills and opportunities to develop curriculum on their own “from scratch” so that they understand how to plan, develop appropriate assessments, identify big ideas in the discipline, and develop their ability to engage in pedagogical thinking; teacher educators must also give new teachers sufficient opportunities to use, adapt, enact, and critique the existing curricula they may be required to use in their classrooms.

Grant and Agosto (this volume) observe that the qualities typically associated with a conception of teacher capacity are “entangled, slippery and vague.” Yet if we define teacher capacity as enacted in particular practices, practices that embody theoretical principles of instruction, learning, development, and culture, practices that can be developed and refined over time, we begin to move away from an amorphous conception of capacity toward a more concrete understanding of what teachers really need to know and be able to do.

REFERENCES

For the purposes of accreditation, the National Council for Accreditation of Teacher Education (NCATE) would define teacher capacity as what teachers and other school professionals should know, be able to do, and be disposed to. In fact, NCATE’s Standard 1 is entitled “Candidate Knowledge, Skills, and Dispositions.” However, teachers, teacher educators, policymakers, parents, and critics do not always agree on the capacities that teachers should develop. They agree that teachers should know the subjects they teach, and should be able to help students learn those subjects. Consensus has not been reached on whether “good teaching transcends settings and populations” (Howard and Aleman in this volume, Chapter 10). Many teacher educators, particularly multiculturalists and critical theorists, believe that teachers must understand the power dimensions of society as well as the cultures and prior experiences of students, their families, and communities to help all students learn and become active participants in a democracy. Others are not so sure.

Critics of teacher education charge that teacher education prepares teachers with “warm and fuzzy” notions about teaching such as developing self-esteem and helping students feel good about themselves at the expense of in-depth study of content or subject matter. In fact most secondary teacher candidates do major in their subjects. Requirements for mathematics and literacy in elementary and special education are increasing. The NCATE program standards for elementary education require candidates to develop content proficiencies in reading and English language arts, mathematics, science, and social studies. The number of credit hours required for a baccalaureate degree is often limited to around 120 hours, limiting the amount of time for both in-depth study of content and the study of teaching and learning in professional education courses. A number of institutions have decided that a four-year program does not provide enough time to adequately prepare candidates to work in schools, and have moved teacher preparation to the graduate level in master’s, post baccalaureate, and fifth year programs. Others are offering graduate pathways into teacher education for candidates who have already completed a bachelor’s program in a content field.

A part of the debate around teacher capacity focuses on what teachers should know. Is there a set of proficiencies that teachers should develop and who should determine them? Beginning in the late 1980s, teacher educators, researchers, and policymakers developed national and state standards for what students and teachers should know and be able to do. The teacher standards focus on the subjects being taught and the age/grade of students. These are generally accepted for state program approval and national accreditation by the National Council for Accreditation of Teacher Education (NCATE). The Council of Chief State School Officers (CCSSO) has incorporated very similar standards in the model licensure standards of the Interstate New Teacher Assistance and Support Consortium (INTASC), which many states have adopted or adapted. Similar standards
have also been developed for the national board certification of teachers by the National Board for Professional Teaching Standards (NBPTS).

However, not everyone agrees that the profession should set its own standards. A number of national committees with business representatives, policy makers, and other non-educators have produced reports with recommendations about teacher education. They call for a greater emphasis on academics, the elimination of teacher education, and testing of teachers. The U.S. Department of Education promotes a curriculum based solely on scientifically based research in reading, mathematics, etc. A recent study by the National Council on Teacher Quality (NCTQ) ranked 72 institutions based on an examination of the syllabi and textbooks of reading courses in their elementary education programs for references to the five components of effective reading instruction (phonemic awareness, phonics, fluency, vocabulary, and comprehension) identified by the National Reading Panel in its report to the National Institute of Child Health and Human Development in 2000. President George W. Bush has now appointed a similar panel on mathematics to determine the critical components of mathematics that should be taught in the nation’s schools. When this report is complete, states and schools may receive federal funding to implement the recommendations in a way similar to the Reading First projects. When it comes to what should be included in the teacher education curriculum related to diversity, the disagreement can become very polarized as will be discussed later.

Another part of the debate on teacher capacity focuses on when teachers learn the expected proficiencies. Some critics of teacher education believe that professional knowledge and skills are more effectively developed on the job after receiving a college degree rather than as part of the college degree. The question is not so much whether teachers should have the capacity to teach all students, but whether they learn their profession in college or in schools when they accept their first teaching job.

As part of the accreditation process, NCATE is concerned with the impact of a program on a candidate’s capacity. It has worked with numerous professional associations to determine the capacity a teacher needs to ensure that all P-12 students learn the subject and other important proficiencies. With this goal, NCATE’s Standard 1 asks institutions to provide evidence that teacher candidates and candidates preparing for other professional school roles have the knowledge, skills, and dispositions outlined in professional, state, and institutional standards. McDiarmid and Clevenger-Bright earlier in this volume (Chapter 9) suggest that the focus on knowledge, skills, and dispositions may be an “old formula” that is “too static and individualistic a framework for thinking about teacher capacity.” They suggest that teaching is too complex and contextually based to be captured in this way. At the same time, they suggest that a disposition(s) might capture the milieu in which teachers work. It is “ability to step outside of one’s practice and examine it in good company and in light of a range of data” that might include community expectations and the insights and perspectives of colleagues. The concern that knowledge, skills, and dispositions is an old formula might be correct if candidates’ proficiencies were static and prescriptive. NCATE and its member organizations have tried to keep their standards current with research in the field by reviewing them every seven years. Most standards are framed in terms of broad statements of knowledge, skills, and dispositions and are not specific and narrow.

McDiarmid and Clevenger-Bright also highlight the importance of a culture of evidence in schools and teacher education. NCATE agrees, requiring institutions to show that candidates are meeting standards through assessments. In addition, Standard 2 on the unit assessment system requires that faculty, candidates, and other members of the professional community regularly review the assessment data to improve programs and candidate performance.
DIVERSITY IN TEACHER EDUCATION PROGRAMS

Since 1979, NCATE has expected accredited institutions to prepare candidates to work with diverse student populations. The 1979 standards included a standard on multicultural education. Today, Standard 4 on diversity has requirements for curricula, field experiences, faculty, candidates, and the P-12 students with which teacher candidates work. It requires candidates to acquire and demonstrate the capacity to help all students learn as shown below:

The unit designs, implements, and evaluates curriculum and provides experiences for candidates to acquire and demonstrate the knowledge, skills, and professional dispositions necessary to help all students learn. Assessments indicate that candidates can demonstrate and apply proficiencies related to diversity. Experiences provided for candidates include working with diverse populations, including higher education and P-12 school faculty, candidates, and students in P-12 schools.

(NCATE, 2006b)

In addition, all accredited institutions are expected to have a conceptual framework that includes diversity. Diversity could be one of the lenses through which all teacher education is delivered as some multiculturalists and critical theorists suggest. The closest that NCATE comes to identifying teacher capacity related to diversity is in the first rubric for the diversity standard. At the acceptable level, the following proficiencies for candidates’ capacity related to diversity are indicated:

- understand diversity, including English language learners and students with exceptionalities;
- be aware of different learning styles and adapt instruction or services appropriately for all students;
- connect lessons, instruction, or services to students’ experiences and cultures;
- communicate with students and families in ways that demonstrate sensitivity to cultural and gender differences;
- incorporate multiple perspectives in the subject matter being taught or services being provided;
- develop a classroom and school climate that values diversity;
- demonstrate classroom behaviors that are consistent with the ideas of fairness and the belief that all students can learn.

(NCATE, 2006b)

These expectations also reflect the knowledge, performance, and dispositions in the INTASC principles. They address some of the proficiencies that multiculturalists and critical multiculturalists raise in the literature, but they do not address many of the issues that these theorists think are important. Accreditation agencies balance among best practices, what is known from research, and what should or could be. The NCATE requirements push institutions to design curriculum and experiences for education candidates to help them learn how to work with diverse students and to value the diversity of the United States. They do not require the inclusion of the issues identified by multicultural theorists although faculty may decide to include study beyond that required by the NCATE standard. Other than ensuring that candidates can help students learn or support student learning in non-teaching roles, NCATE does not specifically require social action or the reconstruction of schools to eliminate inequality. The intent of the diversity standard is to close the achievement gap among students from diverse groups.
McDiarmid and Clevenger-Bright report that many institutions have courses on multicultural education and special needs students, but “the gaps in pupil achievement, high school graduation, and college attendance persist and inclusion continues to be a problem in some schools.” Howard and Aleman contend in this volume that teacher education programs are not preparing teachers to be critical multicultural educators because (1) multicultural and diversity issues are addressed in separate classes and not integrated through all classes and (2) fieldwork does not help them acquire the necessary skills. They suggest that the second is, in part, the fault of critical theorists who have not posited a set of proficiencies that critical teachers should have. However, attention to the needs of diverse learners or social justice may not be developed at all if courses specifically on multicultural education and special education did not exist. On entrance into teacher education, most teacher candidates have limited knowledge of and experience with people different from themselves. Although diversity should be integrated in all courses, a multicultural education course can provide the basic knowledge base on diversity and related equity issues.

Howard and Aleman report that some critics of multicultural education indicate that it “relies too heavily on theory with few, if any, implications for practice.” They recommend increased attention to field experiences and criteria for school and university supervisors. I agree that ideals like social justice, if a part of the teacher education unit’s conceptual framework, need to be incorporated into methods courses and field experiences. At the same time, leading scholars and practitioners in the field should provide examples and themselves model the practices that they are promoting.

The closest the NCATE standards come to addressing faculty capacity is in the rubric, which accompanies each standard, on faculty diversity in which professional education faculty, including the school and university supervisors of student teaching, “have knowledge and experiences related to preparing candidates to work with diverse student populations, including English language learners and students with exceptionalities.” Standard 5 on faculty qualifications expects them to “integrate diversity and technology throughout their teaching.” Teacher educators are expected to regularly and systematically examine candidate assessment data. If completers of teacher education programs are not helping students learn once they are in the classroom, it is time for faculty to chart a different course.

SOCIAL JUSTICE

The meaning of social justice appears to be in the eyes of the beholder. The papers and artifacts in this volume have presented numerous definitions from the literature. In 1988 Maxine Greene believed that it was the removal of “obstacles” such as poverty, sickness, and ignorance. James Baldwin did not use the words, social justice, when he spoke to teachers in 1963, but he did speak to one’s responsibility “to examine society and try to change it and to fight it—at no matter what risk.” The same sentiment is reflected in Paulo Freire’s “Letters to Those Who Dare Teach.”

The literature refers to equality within schools, teaching as a political act, social responsibility, caring, ethics, concern, sense, an orientation, concern with quality of life, and social consciousness about injustice, discrimination, racism, power, etc. Many authors link the concepts of democracy, justice, and struggle (Grant & Agosto in this volume). A number of teacher education units list social justice as part of their conceptual framework or identify other related concepts such as urban teaching, teaching all students, etc. However, conceptual frameworks are not always explicit about the capacities
that a candidate should have to reflect social justice or multicultural education in their teaching.

What does NCATE say about social justice? Social justice is included as an example of a disposition in the NCATE standards used for visits between 2001 and 2008. NCATE does not define social justice, but it has defined dispositions as

The values, commitments, and professional ethics that influence behaviors toward students, families, colleagues, and communities and affect student learning, motivation, and development as well as the educator’s own professional growth. Dispositions are guided by beliefs and attitudes related to values such as caring, fairness, honesty; responsibility, and social justice. For example, they might include a belief that all students can learn, a vision of high and challenging standards, or a commitment to a safe and supportive learning environment.

(NCATE, 2006a)

As part of the revision of the NCATE standards that will become effective in 2008, the term, dispositions, has been changed to professional dispositions to more clearly indicate that NCATE is primarily concerned with teacher behavior in classrooms and schools. The new definition, which indicates that teacher educators should base their assessments on behaviors rather than beliefs and values, reads as follows:

*Professional dispositions:* The behaviors demonstrated as educators interact with students, families, colleagues and communities, which are expected of professionals and support student learning and development. NCATE expects candidates to demonstrate classroom behaviors that are consistent with the ideas of fairness and the belief that all students can learn. Based on their mission, professional education units may determine additional professional dispositions they want candidates to develop. NCATE expects institutions to assess professional dispositions based on observable behavior in educational settings.

(NCATE, 2006b)

NCATE’s new definition of professional dispositions does not identify social justice as an example or requirement. It also does not prevent an institution from including social justice as a part of its conceptual framework or as the centerpiece of its mission and work.

**SOCIAL JUSTICE UNDER ATTACK**

Social justice in teacher education became part of the mainstream news in 2005. The first report of a few students resisting “social justice” and threatening law suits appeared in *The New York Sun* on May 31, 2005. Several teacher candidates had charged an instructor with discrimination based on their political beliefs, which they perceived as not aligned with the School of Education’s conceptual framework, which included “social justice.” A professor of history and another of business and economics sided with the students, charging that the assessment of dispositions was leading to indoctrination into leftist ideology. They blamed NCATE’s requirement for dispositions for politicizing teacher education

Soon afterwards the National Association of Scholars (NAS) weighed in on the issue with a letter to the U.S. Assistant Secretary of Education requesting that NCATE be
stripped of its authority to accredit. The NAS did not limit its attack to NCATE, it also asked that the right to accredit be withdrawn from the National Association of Social Workers (NASW) because of its social justice requirement. The Thomas B. Fordham Foundation published an article by a professor at Stanford that equated dispositions with personality and attacked NCATE’s requirement for the assessment of dispositions as giving education schools “unbounded power over what candidates may think and do” through “ideological arm-twisting and Orwellian mind-control” (Damon, 2005, p. 1). The Foundation for Individual Rights in Education (FIRE) has been working with candidates in these schools to make sure their First Amendment rights are not violated by social justice assessments.

The news then escalated to the national level with an article in *U.S. News & World Report* by John Leo. Leo repeated the accusations from candidates at Brooklyn College and added the woes of a student at Washington State University who complained that faculty had failed him on his professional disposition evaluations because he expressed conservative opinions in his classes. Again, the claim was that NCATE required accredited institutions to incorporate social justice in their curriculum. Articles in the *Chronicle of Higher Education* expanded the stories to include the University of Alabama and University of Alaska. In January 2006 George Will joined the bandwagon in a commentary in *Newsweek* that suggested that students with conservative views were being weeded out of teacher education programs. He claimed that NCATE focused on a candidate’s beliefs and attitudes and cared not whether teachers understand the subjects they will teach.

Following NCATE’s hearing for re-recognition by the U.S. Department of Education, an article in the online *Chronicle of Higher Education* announced that NCATE had dropped its standard on social justice. Of course, as noted, NCATE never had a standard on social justice. The only reference to social justice was an example in the glossary definition of dispositions. NCATE continues to have a standard on diversity that has become stronger with each iteration of the standards since 1978. The debate about dispositions and social justice has continued in *Inside Higher Education*’s blog, “A Spirited Disposition Debate,” at http://www.insidehighered.com/news/2006/06/06/disposition.

Why the attack? Maybe some teacher education programs have begun to include a critical multicultural perspective, which some conservatives connect to the liberal faculty members they perceive as dominating universities. On the one hand, critics view social justice as attacking our social and political system that causes the inequities. NCATE has been attacked for years by right-wing groups for its standard on diversity. Robert Holland from the Lexington Institute in Virginia was quoted as saying “The tight link between the accreditors and multiculturalists indicates that social justice is being defined by those who despise the very ideal of an American common culture—considering it irredeemably racist, sexist, homophobic, etc” (Gershman, 2005, p. 6). One group periodically contacts policymakers and chief state school officers suggesting that NCATE and the National Association for Multicultural Education (NAME) are corrupting the minds of children with their attention to diversity.

The American Bar Association (ABA) is the latest accrediting group to be attacked for including diversity in standards. The U.S. Commission on Civil Rights attacked the group in June 2006 for proposed standards that the Commission perceives as requiring racial preferences for hiring and admission. The Center for Equal Opportunity joined NAS in protesting the standards, threatening to sue the ABA if the standards are adopted.
CONCLUSIONS

When social justice refers to working with the least advantaged students to ensure that they are provided all of the opportunities necessary to learn at the same levels as advantaged students, most people see it as a laudable goal. Even No Child Left Behind requires the disaggregation of test data by race, sex, native languages, and ability to determine the group of students not being well served in school. When the discussion of equity in a teacher education course begins to question the current distribution of goods and benefits in society, many conservatives see it as an attack on the American way of life. They may believe that racism, sexism, classism, and homophobia do not exist or are inflated beyond their actual occurrence. Perspectives on social justice vary across a cohort of teacher education candidates. Some are very supportive because of their religious background or their intense concern and empathy for less advantaged families. Others argue that white privilege and oppression do not exist.

Faculties who are reforming their programs to reflect multiculturalism or social justice should consider how they will help candidates understand diversity or social justice and develop educational strategies for ensuring that P-12 students achieve at equitable levels. Howard and Aleman identify several strategies being used by faculty to increase candidates’ awareness of the issues and develop their commitment to overcoming existing inequities among students.

As Howard and Aleman point out, examples of integrating multiculturalism or social justice into classrooms can help candidates understand how they could be reflected in classrooms. The teachers who write in the periodical, Rethinking Teachers, describe their work at engaging students with real world issues such as child labor, homelessness, and immigration throughout the school year. Teachers tell their stories about working with students from low-income families, students with disabilities, English language learners, and students of color in segregated schools in a number of books. During their preparation programs, teacher candidates should have the opportunity to observe and collaborate with teachers who have eliminated the achievement gap between groups of students. Programs that are serious about social justice help candidates understand the courage it takes to deliver social justice in classrooms. The realities of student, and sometimes community, resistance to multicultural education or social justice should be discussed along with ways to gain support and not become discouraged.

A number of accrediting agencies include diversity or social justice in their standards, in part, because the clients that will be served by the professionals who complete programs are increasingly diverse in race, ethnicity, language, and religion. They are more likely to be in poverty, have low-incomes, or have a disability than in the past. The professionals who write standards believe that the graduates of accredited programs should be able to serve these populations effectively, equitably, and without bias. As part of learning how to work with diverse clients, most professional groups think that society, its institutions, and the profession itself need to be studied and understood for the way clients from different groups have been treated over time. This study almost always reveals inequality and discrimination. It seems quite appropriate that accrediting agencies require programs in their fields to incorporate attention to diversity or social justice in the curriculum.

NCATE not only requires accredited schools, colleges, and departments of education to incorporate diversity into the curriculum and experiences of programs, it also requires an institution’s conceptual framework to identify the proficiencies related to diversity that candidates should develop. Diversity proficiencies include knowledge, skills, and dispositions. NCATE’s standard on diversity does identify some proficiencies
for which there is general professional consensus. However, NCATE gives education faculty a great deal of latitude in identifying proficiencies not included in other sets of standards to which they are being held such as the content standards for mathematics or early childhood teachers. A number of religious institutions include social justice in both their conceptual framework and institutional mission. The faculty in a growing number of public institutions, especially those serving urban areas, have also adopted social justice.

Whatever proficiencies the faculty includes in their conceptual framework, candidates must be assessed to determine if they are developing those proficiencies. The assessments used to determine whether candidates are developing explicit proficiencies are developed by faculty. For the assessment of dispositions, which could include social justice, NCATE recommends against the use of attitude or belief scales. Instead, NCATE recommends that dispositions be assessed as candidates work with students, parents, and colleagues at the university, in schools, and in communities. The NCATE standards do not require the development of critical multiculturalists as described in the Howard and Aleman chapter. However, they do push teacher education programs to incorporate some multicultural concepts and develop some of the dispositions that are inherent in social justice such as fairness and the belief that all students can learn.

As professions think about the proficiencies that their members need to provide effective services to their clients, an understanding of their clients and communities is important. Teachers need first to have an in-depth understanding of the subjects they teach. In addition, they need to know how to help the P-12 student learn what is being taught. To do that, they need to know the culture and prior experiences of their students and be able to draw on representations from the real worlds of their students. To provide a quality education to students who have limited economic and educational advantages requires educators who are advocates for their students. Accreditation standards, at a minimum, should expect graduates of its schools to have the knowledge, skills, and dispositions to help all students learn.

NOTES

1 NCATE has the following six standards: 1-Candidate Knowledge, Skills, and Dispositions; 2-Assessment System and Unit Evaluations; 3-Field Experiences and Clinical Practice; 4-Diversity; 5-Faculty Qualifications, Performance and Development; and 6-Unit Governance and Resources.
2 A teacher education unit is usually the Department, School, or College of Education at a college or university.

Where should teachers be taught?

Settings and roles in teacher education

Editor: Kenneth Zeichner
Part 3

Framing chapters
One of the most vigorously debated issues throughout the history of formal teacher education has been concerned with the role of various settings on the formation of teachers. Since the mid-nineteenth century, institutions have existed in the U.S. that have had as part of their mission the preparation of teachers for America’s public schools. Throughout the history of formal teacher education in the U.S. which began in the early nineteenth century with academies, normal schools, and teacher institutes, a variety of models for preparing teachers have emerged that have emphasized the role of different settings in the education of teachers.

For example, the Master of Arts in Teaching model which was initiated at Harvard in 1936 (Zeichner, 1988) has emphasized the liberal arts and content preparation of teachers in colleges and universities along with learning from firsthand teaching experience in schools while providing a very limited preparation in professional education coursework. This lack of emphasis on formal class work preparation in the professional education aspects of learning to teach such as classroom management, curriculum, instructional practices and conducting assessment (Darling-Hammond & Bransford, 2005) in favor of learning about the professional aspect of being a teacher on the job has also characterized some of the school-based alternative routes into teaching that have emerged in recent years.

Also, arguments have been set forth for many years for extending the pre-service education of teachers from the standard four-year college and university preparation to five or more years so that teachers can begin teaching with a good grasp of the content that they will teach and its pedagogical implications as well as having studied the professional knowledge base that some claim is necessary to acquire to teach successfully (Denemark & Nutter, 1984).

Other models of teacher preparation such as the National Teacher Corps which existed from 1965 through 1981 (Smith, 1980) have stressed the role of local communities in educating teachers for its schools and have expanded the definition of field experiences in teacher education to include experiences for prospective teachers in the communities served by the schools in which they work as student teachers. The idea of community field experiences in a pre-service teacher education program to contribute to developing the cultural competence of teachers to teach in community responsive schools that are anchors in their communities has been around a long time (see e.g. Flowers et al., 1948).

The emphasis of different settings in the education of teachers has reflected different visions of the role of the teacher and of the school in relation to the community which can be in tension with one another. For example, there is a danger that too much of an emphasis on professionalizing teaching through mastery of the knowledge base for teaching can, unless steps are taken to balance this aspect of the teacher’s role with other
aspects, serve to undermine teachers responsiveness to parents and local communities (Zeichner, 1991).

This section examines a variety of perspectives on the contributions of different settings to the education of teachers. The issue of settings for teacher education has become particularly significant in recent years in the U.S. as the pathways into teaching have increased. There are many different ways to become a teacher now in the U.S. that emphasize the role of different settings in educating teachers. The role of universities, schools and communities in teacher education are explored in this section through the framing papers, artifacts, and commentaries. So too is the position that the personal characteristics of prospective teachers rather than the settings in which they are prepared is the key element in the preparation of teachers.

FRAMING PAPERS

Universities as settings for teacher education

David Labaree examines the evolution of teacher education in universities in the U.S. and illuminates several of the enduring issues that have faced teacher educators within these institutions. He identifies two different patterns in teacher education’s existence within universities and argues that the effects of universities on teacher education depend on the type of university in question. The two patterns Labaree identifies are the evolution of teacher education from normal schools and state teachers colleges into regional state universities and the evolution of teacher education within elite research universities from single education professorships to departments to schools and colleges of education. He discusses what is potentially gained and lost both by teacher education and by the university in both regional state universities and research universities and how this has affected the relationship between teacher education and their institutional homes.

Labaree discusses the enduring tension between the professional and academic missions of Education schools and colleges and shows how this tension has been resolved differently within regional state universities and research intensive universities. He argues that a major challenge for leaders of Education schools has been to be able to maintain a delicate balance between their academic and professional missions. He claims that this task has been particularly difficult to achieve in elite research universities where he feels that the professional mission associated with teacher education has been most at risk.

A second enduring tension that Labaree identifies in American teacher education is between quantity and quality in the education of teachers. He discusses the dilemma of wanting to maintain high quality in the preparation of teachers who have a grasp of the knowledge base for teaching (Darling-Hammond & Bransford, 2005) and the market pressures that demand filling empty classrooms with large numbers of teachers who have been less well trained that is desired. He argues that these market forces as well as characteristics of the work of teaching have historically undermined efforts to prepare professional teachers.

Schools and communities as settings for teacher education

Marilynne Boyle-Baise and John McIntyre address the ways in which professional development schools and communities serve as settings for preparing teachers to teach
culturally diverse students in our public schools. Their chapter considers the range of knowledge, skills, and dispositions that the authors think teachers need to do this job well including mastery of content knowledge, multicultural understanding, and an asset-based view of students and their families.

Boyle-Baise and McIntyre explore the tensions between emphasizing the preparation of teachers who have gained mastery over a body of professional knowledge (the professional teacher) and teachers who are responsive to and build upon the cultural resources brought to school from their families local communities (the community teacher). They attempt to resolve the tensions between these two different views of the role of the teacher and of the place of the school in communities by broadening the way in which professionalism is viewed to include the development of community knowledge and the ability to engage in culturally responsive teaching practices.

Boyle-Baise and McIntyre discuss a variety of experiences in pre-service teacher education programs such as the completion of field experiences in professional development schools that aim to more closely connect course work and clinical experiences, service learning, cultural immersion, and various experiences in studying the assets and resources in communities that they argue will serve under certain conditions to prepare teachers to successfully serve culturally diverse students and their families in today’s public schools.

Teacher education programs as settings for teacher education

Zeichner and Conklin explore various issues related to teacher education programs as settings for educating teachers. Rejecting the simplistic distinctions that have dominated the literature and policy discussions (e.g. traditional vs. alternative certification and 4-year vs. 5-year vs. postgraduate programs) they propose a conceptual framework that identifies the various structural and substantive dimensions along with teacher education programs differ from one another.

This conceptual framework considers both the structural aspects of teacher education programs such as how long they are, whether they are located at the undergraduate or post graduate level and the type of institution that sponsors them. It also considers a number of substantive aspects of programs including the nature and coherence of a program’s mission, its admission processes, curriculum, the nature of field experiences, various internal organizational features such as staffing patterns, instructional practices, and the ways in which data are used to make programmatic decisions. Zeichner and Conklin draw on several national case studies of teacher education programs to identify what research suggests makes an exemplary teacher education in relation to the various program elements in their conceptual framework. They argue that there is likely to be a variety of effective pathways into teaching rather than one effective program model and that the challenge that lies ahead is to ensure that elements of program excellence are present in all of the various pathways into teaching.

Although this section examines the implications for teacher preparation of different settings on teachers learning to teach, there are other settings and contexts that are relevant to understanding teacher education that are not fully explored in this set of documents. These include the growing influence of state and national policy contexts on the education of teachers and as commentator Sharon Robinson points out, the growing use of online learning environments for teachers.
Three artifacts are included in this section that highlight various aspects of the role of settings in educating teachers. The first artifact, a 1999 chapter by Linda Darling-Hammond, responds to critiques of university-based teacher education and while acknowledging several longstanding shortcomings of university programs such as fragmentation of the curriculum, she argues the case regarding the importance of universities to educating teachers for the complex and demanding work that teaching entails. She outlines what she feels teachers need to learn and be able to do, and explains why she thinks it is necessary for universities to play an important role in helping them learn these things. Her solution to the weaknesses of university teacher education is to develop more powerful teacher education programs in universities (e.g. Darling-Hammond, 2006) not to eliminate the university’s role as some have suggested in recent years.

In contrast to Darling-Hammond’s defense of the university’s role in teacher education Martin Haberman and Linda Post in a paper published in 1998 argue based on their experience in their recently closed Metropolitan Multicultural Teacher Education Program that the personal characteristics of prospective teachers together with what they learn on the job from credible mentors are the most important factors in preparing teachers to be successful in multicultural urban schools serving children in poverty. Haberman and Post outline a set of personal characteristics of successful teachers in urban schools (“star teachers”) that they feel are the key elements in teaching success in high poverty urban schools including such traits as self-knowledge and self-acceptance, empathy, being able to function in chaos, and awareness of and working on one’s own racism, classism and other prejudices.

Haberman and Post believe that for urban teaching, teacher education is only useful for those who have the personal characteristics of “star teachers” and feel that colleges and universities “should be involved in but not in control of the preparation of teachers for children in poverty” (p. 104). Their position is that research and theory should complement the appropriate personal characteristics and careful mentoring on the job by successful urban teachers.

The final artifact, a 2002 paper by Barbara Seidl and Gloria Friend emphasizes the role of communities in the preparation of teachers who develop more mature anti-racist identities, bicultural competence, and the ability to teach in more culturally responsive ways. Their paper describes a community-based internship at a large African American church in Columbus OH that is part of a five quarter post baccalaureate teacher education program at Ohio State University. This experience involves prospective teachers in working for two to three hours per week with adults from the church community in programs for children developed by the community.

Seidl and Friend identify several aspects of this cross-cultural community internship that they think are responsible for the growth they were able to stimulate in three cohorts of mostly white teacher education students. These include the importance of student teachers working with equal-status (in economic and professional terms) adults over time so that they could develop cross-cultural caring relationships and the careful mediation of prospective teachers’ community experiences through coursework (e.g. on the sociopolitical context of racism) and planned and structured group conversations between the teacher education students and members of the church community.
COMMENTARIES

Three discussants respond to these papers and artifacts that represent different points of view. First, Michelle Rhee, the director of the “New Teacher Project,” an alternative route program that recruits, selects trains, and facilitates the hiring of new teachers for placement in high need urban school districts across the U.S. This program includes a rigorous selection process, a very brief pre-service training period of six to eight weeks focusing on teaching in high-need urban schools, and a carefully structured seminar series provided by experienced teachers after the new teachers assume full responsibility for an urban classroom. The program emphasizes the selection of teacher candidates who are deeply committed to working in high need urban communities over time. Rhee contrasts her approach in this alternative route with university-based programs which she feels do not adequately prepare teachers to work in urban schools.

The second discussant, Sharon Robinson, the president and CEO of the American Association of Colleges for Teacher Education, comments on the papers and artifacts from her position of close contact with national and state policy makers. She rejects the position that there is a single best model for educating teachers and raises the issue of how all of the various settings discussed in this section (schools, communities, arts and science faculties and ed schools) can best be brought together in the service of designing the best possible teacher preparation programs. The measure of a successful education for teachers according to Robinson must be determined in relation to its ability to promote both teacher and student learning.

Finally, Bob Houston, a long time professor of teacher education at the University of Houston, discusses the ways in which settings for teacher education have shifted over time in relation to various cultural changes in the society and within particular institutions like universities. Houston notes the emergence of several new hybrid settings for teacher education such as the school or center of pedagogy (Goodlad, 1994; Smith, 1980). He discusses the broad spectrum of factors that effect how particular settings for teacher education influence the character and quality of teacher education.

17 Teacher education programs as sites for teacher preparation

Kenneth Zeichner
University of Wisconsin-Madison

Hilary G. Conklin
University of Georgia at Athens

We are divided about whether the primary faculty should be academics or practitioners. We disagree about whether the curriculum should be largely coursework or field experience. And, of course, we differ regarding the amount of education students require before entering the classroom. The enormous diversity of practices within university and non university teacher education muddles the path further. (Levine, 2006, p. 17)

This chapter explores issues related to the idea of teacher education programs as sites for the preparation of teachers and the varying dimensions of these programs that may contribute to effective teacher preparation. When debates about the efficacy of different forms of teacher education have occurred, they mostly have been framed around arguments about the advantages and disadvantages of different program models. While the literature discusses many different ways in which teacher education programs can be distinguished from one another, empirical research on the consequences of entering teaching through different kinds of programs has typically taken into account a very narrow range of these program features. In this chapter, following a discussion of how the empirical research has defined teacher education programs and has begun to identify program characteristics that are related to desired outcomes for teachers and their pupils, we will broaden the discussion by outlining a conceptual framework for thinking about programs that takes additional elements into account. We will conclude with a discussion of how we think the broader framework that we present for thinking about teacher education programs can be useful to both researchers and teacher educators as they design research and plan and renew teacher education programs.

TEACHER EDUCATION PROGRAMS AS DESCRIBED IN EMPIRICAL RESEARCH

Between 1999 and 2004, we conducted a review of peer-reviewed research on teacher education programs in the U.S. conducted between 1985 and 2004 as part of the work of the American Educational Research Association Panel on Research and Teacher Education (Zeichner & Conklin, 2005). In this review, we analyzed 37 studies that used a variety of teacher and pupil outcome measures to assess the effectiveness of different kinds of teacher education programs. The programs were assessed in relation to a variety of teacher and pupil outcomes including teacher efficacy, evaluations of teachers’ practices, teacher retention and student learning. The most common distinction that was made among programs in these studies was in terms of program structure such as
length (e.g., 1, 4, 5 years), when they are offered (undergraduate, graduate), and by the institutions that sponsor them (e.g., college or university, school district).

Much of the discussion about teacher education program reform in the U.S. has focused on the impact of teacher education programs’ structural characteristics. For example, there have been numerous proposals to lengthen undergraduate preservice teacher education to 5-years or to move it to the graduate level entirely (e.g., Denmark & Nutter, 1984; Holmes Group, 1986). There have also been arguments to preserve the four-year undergraduate model as the dominant pathway into teaching (e.g., Hawley, 1987). Arends and Winitzky (1996) provide a summary of the different structural models that have existed and of the debates about their merits and shortcomings.

In our AERA panel work, we grouped the studies that we analyzed into several categories according to the comparisons made by researchers. These were: four-year programs vs. five-year programs, state sponsored alternative programs vs. traditional programs, university-sponsored alternative programs vs. traditional programs, school district sponsored alternative programs vs. traditional programs, studies involving “Teach for America,” and comparisons of multiple alternative and traditional programs.

In grouping programs as alternative or traditional, we defined an alternative program as any program other than a four or five-year undergraduate program at a college or university. One problem with the classification of programs into alternative and traditional which was made necessary because of the nature of the research we were examining is the tremendous variation that exists within each of these categories. Shulman (2005a) has argued that “the claim that traditional programs can be contrasted with alternative programs is a myth. We have only alternative routes into teaching.” This same problem exists for four-year and five-year programs and with the categories of graduate and undergraduate programs. Our analysis showed that Shulman is right because there was a lack of clear and consistent findings about the effects of any particular type of teacher education program only defined by a four-year or five-year or traditional or alternative designation.

In addition to the differences within these categories, programs also exist in different kinds of institutional contexts (e.g., research universities, liberal arts colleges) and in different state policy contexts. Goodlad’s (1990) national study of teacher education suggests that institutional variation is a major source of difference among teacher education programs. State policy contexts also vary in significant ways that help define the character and quality of teacher education programs. For example, a four-year program in Texas where the state has capped the number of education courses in preservice programs will be very different in significant ways from a four-year program in a state like Wisconsin where the state has maintained a strong emphasis on the professional component of preservice programs. Also, although the INTASC standards (Council of Chief State School Officers, 1992) have had much influence on state standards across the U.S., there is much variation in what states require to obtain an initial teaching license. For example, some states require elementary education teachers to complete academic majors for a teaching license while others do not require this and allow students to major in education at the undergraduate level with varying levels of preparation in academic content knowledge.

Neither teacher educators nor policymakers are well served by the current emphasis in research on comparing the efficacy of teacher education programs that are only described by general labels such as those discussed above. Kliebard (1973) noted during the era of teacher effectiveness research in the U.S. that research on teaching was structured mostly in the form of a horse race: “Sometimes one horse wins, sometimes the other; often it is a
tie” (p. 21). Kliebard argued that this kind of research will never result in useful findings with explanatory value. This same argument can be applied to the current wave of studies comparing so called traditional vs. so called alternative certification programs and four-year vs. five-year programs. More attention to the substantive aspects of teacher education programs and to the contexts in which they exist needs to be part of research on teacher education programs, teacher education planning and renewal efforts, and policy discussions (Zeichner, 2006).

CASE STUDIES OF THE CHARACTERISTICS OF EXEMPLARY TEACHER EDUCATION PROGRAMS

In addition to the bulk of studies which have compared the effects of different pathways into teaching defined only by their surface level structural characteristics (e.g. their length, sponsor, etc.), a few multi-site case studies have been conducted that have begun to illuminate more specific aspects of programs that appear to be related to program effectiveness. These include Howey and Zimpher’s (1989) study of six Midwestern elementary teacher education programs, the National Center for Research on Teacher Education’s “Teacher Education and Learning to Teach” (TELT) study (NCRTE, 1991; Kennedy, 1998; Tatto, 1996), the Education of Educator’s study of a nationally representative sample of 29 teacher education programs led by John Goodlad (Goodlad, 1990), case studies of seven exemplary preservice programs sponsored by the National Commission of Teaching for America’s Future (Darling Hammond, 2000, 2006), a national study of alternative certification programs conducted by researchers at SRI (Humphrey & Wechsler, 2005; Humphrey et al., 2005), case studies of teacher preparation in 28 schools, colleges and departments of education across the nation (Levine, 2006) completed by the Education Schools Project, and case studies of teacher education programs that prepare teachers to specialize in the field of bilingual education, ESL, and/or multicultural teacher education sponsored by the Center for Research on Education, Diversity and Excellence (Walton et al., 2002).

Although these studies do not provide definitive evidence linking particular program components to specific teacher and pupil outcomes (see Zeichner & Conklin, 2005), they suggest some elements of teacher education programs that should be further investigated by researchers. They also suggest a way to think and talk about teacher education programs that is more meaningful than what is present in the dominant discourse on this issue in the literature. In general, these case studies point to the need to look beyond the surface structural features of teacher education programs in order to understand the key elements of program effectiveness. In addition to understanding the elements of successful teacher education programs, we also need to understand how to transform programs so that they embody these characteristics (Hammerness, 2006).

Following are some examples of some of what these case studies have to say about the critical components of effective pre-service teacher education programs. We look first at the institutional context of teacher education programs, considering the social and political context attributes that are important to the functioning of programs. We then examine important attributes at the program level such as how a program is organized and program goals. Next we consider the people involved in a teacher education program, both teacher educators, and teacher candidates. Finally we explore the substance of teacher education programs and discuss the nuances of coursework, field experiences, the ways in which candidates are taught, and the data that informs how they are
taught. Following this discussion of the empirical case literature on teacher education programs, we will present a conceptual framework for thinking about teacher education programs that draws on the extant research but that also goes beyond the limited empirical categories that have been investigated by researchers.

The social and institutional context of teacher education programs

Goodlad (1990) bases his assumptions about the elements of good teacher education programs on a moral commitment to the role of education in democratic societies rather than on empirical data. He draws our attention to the importance of the policy and institutional contexts in which programs are located. First, he argues that in order for programs to have the potential to thrive and produce exemplary teachers, they must have strong institutional support in terms of physical and budgetary resources and ideological support needed to prepare future teachers well. This means that teacher education faculty would have comparable standing, workloads and other rewards to other faculty within an institution. Goodlad’s research team found that this support was present to varying degrees in different kinds of institutions (e.g. liberal arts colleges, research universities), but generally they concluded that teacher educators lacked the infrastructure support and advocacy in their institutions needed to enable exemplary teacher education programs to exist.

Program level characteristics

At the program level, all of the case studies help us to think about the way a teacher education program is organized and the overarching beliefs and intellectual quality that drive a program. Organizationally, the cases suggest we need to think about how program components and people are related to one another, and how they come together to form a whole program. Howey and Zimpher (1989) for example, argue that exemplary teacher education programs organize prospective teachers into cohort groups so that they develop a sense of shared identity and accomplishments as they move through particular benchmarks in their programs. All of the case studies emphasize the value of connectedness, coursework and fieldwork being closely tied together and people who work in different parts of a program having strong relationships with one another. Some programs that were deemed by researchers to be exemplary however, were able to establish this connectedness and coherence without the use of student cohort groups (e.g. Darling-Hammond, 2000, 2006).

Similarly, the cases suggest that we should consider how program components are conceptually connected. The TELT study (NCRTE, 1991; Kennedy, 1998) found that the substantive orientation of a teacher education program (rather than its structure) had the greatest impact on what candidates learned. The case studies suggest that it is the guiding ideas of a program that are likely to have the most influence on what prospective teachers learn and suggest that the more coherent a program is with regard to the ideas about teaching and learning and schooling that underlie it, the more powerful the influence is likely to be. The cases as a group suggest that program impact is strengthened by a clear and common vision of teaching and learning that permeates all coursework and field experiences.

For example, in Tatoo’s (1996) study of the impact of different teacher education programs on teachers’ beliefs about teaching diverse learners using TELT data, she concluded:
Our findings across the field of teacher education seem to indicate that in those few cases where faculty espoused more coherent views around professional norms, student teachers tended to show more definite movement toward developing views that were in turn congruent with those espoused by the faculty. Thus coherence around program norms and professional norms seem to play an important role in the influence of teacher education on student teachers’ beliefs about teaching diverse students.

(p. 175)

The particular philosophy or mission of a program is a point worth considering further. Both Goodlad (1990) and Darling-Hammond (2000) correctly note that the particular vision of good teaching a program espouses is necessarily a value-laden judgment that has ethical and moral implications. Goodlad (1990) argues that the mission of teacher education programs needs to be viewed in the context of a democratic society and that doing this provides a certain direction to a program (also see Michelli & Keiser, 2005). Darling-Hammond (2000, 2006) elaborates on the direction that she sees as appropriate in a democratic context and equates the achievement of the goals preparing teachers who can engage in “learner-centered” and “learning-centered” teaching with program excellence.5

There are of course also other visions of what teachers need to know and be able to do that are very different from these “democratic-oriented” views of teaching expertise which prioritize the development of teachers’ abilities to exercise their judgment in the classroom to adapt instruction to the backgrounds and needs of their diverse learners (Zeichner, 2003). For example, there are those who have argued that preparing teachers to faithfully follow teaching scripts based on methods that allegedly have been shown by research to promote student learning is a more appropriate path for teacher education than developing teachers’ abilities to make decisions about which methods to use with particular students at specific times (e.g. Walsh et al., 2006).

Because of these different visions of the appropriate ends of teacher education, strengthening program impact is not necessarily a desirable thing to those who do not share the particular goals of a teacher education program. For example, for those educators concerned about preparing teachers to exercise their judgment in the classroom, making a program more effective in preparing teachers to be compliant implementers of teaching scripts is not a good thing. Similarly, strengthening the ability of a teacher education program to prepare teachers who are proactive decision makers and who are critical of school policies that they do not judge to be in the best interests of their students would not be a desirable outcome for advocates of the idea of teachers as compliant implementers of scripts. In the end, the determination of “excellence” is always dependent on moral and ethical questions and cannot be determined by empirical research alone.

The case studies also suggest that it is important to consider the intellectual quality of teacher education programs. For example, Howey and Zimpher (1989) argue that one of the key attributes of effective teacher education programs is that they are characterized by high levels of rigor and academic challenge. Goodlad (1990) similarly breaks down particular intellectual attributes that he argues are critical to preparing teachers who will be stewards of schools. He contends that teacher education programs must enable teachers to address the tensions inherent in teaching practice, providing them with the intellectual tools needed to negotiate the inevitable issues associated with the disconnect between theory and practice, and tensions between the role of the school in society and individual interests. Goodlad envisions teacher education as an enterprise that prepares
teachers to think beyond the status quo and equips them with the ability to bring about change. Although Goodlad’s (1990) research team did not find a lot of this academic rigor in the 29 teacher education institutions they examined, this is certainly an issue that teacher educators need to consider when looking for markers of program excellence.

Finally, the case studies direct us to consider a teacher education program’s sources of information in evaluating itself and in conducting its daily work. Goodlad (1990) and Howey and Zimpher (1989) contend that high quality teacher education programs have systems in place for evaluating programs based on data including soliciting feedback from its graduates. A sign of program excellence according to this view is the use of data in making decisions about the program.

The people in teacher education programs

The case studies identify several elements related to the people who inhabit teacher education programs (teacher educators and their students). For example, in their case studies of alternative certification programs Humphrey et al. (2005) found that the most effective mentors for prospective teachers were those who knew how to work with adults and were trained in and knowledgeable about specific mentoring strategies. In recent years, there has been increased attention to the fact that teacher educators often receive little preparation in their doctoral programs for the work of teacher education (Cochran-Smith, 2003; Zeichner, 2005). The cases suggest that good programs provide preparation and ongoing support to the teacher educators who work with teacher candidates.

The case studies also address aspects of the candidates who enroll in teacher education programs. For example, the TELT study (Kennedy, 1998; NCRTE, 1991) discovered that recruitment into programs was a crucial element in determining the learning that took place for prospective teachers. This study found that in some cases, programs recruited candidates who already shared the substantive orientation of the program, thereby contributing to outcomes they called “enrollment influences” as opposed to “learning influences” that occurred as a direct result of the impact of the program. Goodlad (1990) suggested that recruitment and admission are fundamentally connected to realizing the goals of a program and argued that teacher education programs should specifically select candidates who possess an initial commitment to moral and ethical aspects of teaching in a democratic society.

The substance of a teacher education program

The case studies also address the character and quality of the coursework and curriculum in teacher education programs including the attributes of the field experiences and the school contexts in which prospective teachers learn to teach, and the ways in which they are taught by their teacher educators.

For example, Darling-Hammond (2000, 2006) argues that exemplary teacher education programs offer extensive course work in child and adolescent development, learning theory, and theories about cognition and motivation and subject matter pedagogy that is taught in the context of practice. Howey and Zimpher (1989) assert that exemplary programs offer a balance between pedagogical knowledge and general knowledge so that teacher candidates do not come away from their preparation with ideas about teaching that are too narrow or technical.

Goodlad (1990) also suggests that good teacher education programs should provide opportunities for candidates to become more “other-oriented” and identify with a
broader culture of teaching. Similarly, he argues that programs should help teachers shift from only being consumers of educational knowledge to also becoming inquirers into knowledge and the nature of schooling.

The case studies also address the attributes of the school contexts in which prospective teachers complete their practicum, student teaching and internship experiences. Goodlad (1990) argues that programs should only admit as many candidates as there are exemplary field placements. Darling-Hammond’s (2000, 2006) case studies suggest that good programs have extended field experiences (at least 30 weeks) that reflect a program’s vision of good teaching and are interwoven with coursework and where the teaching of prospective teachers is carefully mentored.

Finally, Humphrey et al.’s (2005) studies of alternative certification programs highlight salient features of high quality school sites for teacher learning. They found that candidates in effective alternative programs had field placements characterized by collegial relationships, strong leadership and adequate materials and supplies. For example, the candidates in the programs they studied learned more from field placements in which teachers got along and discussed their teaching practice with one another, in schools where principals were supportive and where candidates had access to the materials and resources that they needed to teach. This study also identified several additional opportunities that contributed to program effectiveness: candidates having opportunities to observe other teachers teach, to discuss instruction with colleagues, to get materials and resources from colleagues, and to have others observe their instruction and provide them with feedback. While Humphrey et al.’s (2005) analysis acknowledges that individual candidates will not always benefit from the exactly the same kind of field experience supports, they argue that all good alternative programs provide both emotional and instructional support focused on issues of teaching and learning.

Not surprisingly, the case studies have also addressed the ways in which candidates are taught in their teacher education programs. The cases converge on the conclusion good teacher education programs operate under the same conditions that they advocate for educating K-12 students. As Kennedy (1998) argues, teacher candidates should experience the learning of teaching practices firsthand, as learners themselves; they should have opportunities to consider why new practices are better than conventional ones; and they should have on-site assistance as they learn to implement these new practices themselves.

Finally, the case studies suggest that good programs integrate the instruction of candidates into the context of practice through the use of instructional strategies such as case studies, teacher research, performance assessments and portfolios that connect learning about teaching to the actual problems of teaching practice (Darling-Hammond, 2000, 2006).

While all of these examples of program characteristics that are associated with program effectiveness in accomplishing their goals have received only partial and tentative empirical support in the case studies, they clearly suggest that it is within the substance of teacher education programs and not only in their structural characteristics that clues about program effectiveness are to be found. We will now draw on these case studies which have begun to uncover key elements of program excellence and the broader literature in teacher education to suggest a framework for thinking about the dimensions of a teacher education program. This framework can be used by researchers who study the efficacy of different pathways into teaching, by policy makers, and by teacher educators who want to examine their programs as part of a continual process of self-study and improvement.
A FRAMEWORK FOR THINKING ABOUT TEACHER EDUCATION PROGRAMS

Although most empirical studies of teacher education programs have focused on the structural differences between programs such as their length and who sponsors them, the literature suggests a number of additional features of teacher education programs that should be taken into account by both researchers who study programs and teacher educators who want to improve them (see Figure 17.1). This conceptual framework draws on the case studies just discussed and also on the broader teacher education literature.

We propose this framework as a way to highlight the substantive features of teacher education programs and thereby provide a guide for teacher education research and reform efforts. The program features we discuss below are dimensions along which

- Social and Institutional Context
  - Institutional type and mission.
  - Structure of program (length, undergraduate or graduate).
  - Institutional support for teacher education.
  - State policy context.

- View of Teaching, Learning, Schooling, the Teacher’s Role and Learning to Teach in the Program’s Mission
  - How clearly are they defined?
  - How widely are they shared?
  - Degree of commitment to them.

- Admissions Process
  - Content of admissions criteria.
  - Link to program mission.
  - How selective is the process?

- Curriculum in Course work
  - Emphasis on different aspects of preparation.
  - Placement within the program of different curricular components.
  - Connection to program mission.
  - Representation of different perspectives in the curriculum.
  - Academic rigor.
  - Integration of major topics (preparation to teach diverse learners) into the whole curriculum or in particular courses.
  - Preparation to teach different subject areas.
  - Preparation for teaching students at different age levels.

- Field Experiences
  - Number, length, and placement of field experiences in the curriculum.
  - How closely they are connected to the rest of the program?
  - Teaching responsibility provided.
  - Extent to which they build on prior field experiences.

- Instructional Strategies
  - What are the strategies?
  - How are the strategies used? For what purposes? How are they introduced and supported?
  - Are the strategies advocated for candidate use modeled by teacher educators?

- Internal Organizational Features
  - Use of student cohorts or not.
  - Staffing:
    - Horizontal/vertical.
    - Who are the teacher educators?
    - How were they prepared for their roles and how are they supported in their roles?
  - Level of coherence between field and campus components.

- Use of Data
  - How are data collected about the program used to inform decisions about the program?

*Figure 17.1* A framework for thinking about teacher education programs.
programs vary. In order to understand the particular practices and features of teacher education programs that may matter in terms of desired outcomes for teacher education, we need to understand how different program features are implemented, the extent to which they exist, and the particular quality and focus of their existence. We suggest that attention to these different dimensions and their implementation can help us understand the particular program attributes that lead to effective teacher preparation. As we discuss each of these dimensions below, we offer some specific examples to illustrate the ways in which these different dimensions may look in particular institutions and highlight program attributes that may be productive places for researchers, teacher educators, and policymakers to focus their attention.

**Social and institutional context**

As we discussed earlier in the chapter, we need to consider the type of institution in which as teacher education is housed, the nature of institutional support for teacher education, and the state policy context in order to understand a program. For example, state policies will influence the nature of teacher education programs, just as the size and kind of institution in which a teacher education program is housed will shape a program’s character.

**Key ideas in a program’s mission**

Another element of this model is the view of teaching, learning, schooling and the role of teachers that underlies a program. A number of different general frameworks have been proposed over the years for distinguishing the conceptual orientations of teacher education programs from one another (e.g. Cochran-Smith & Fries, 2005; Feiman-Nemser, 1990; Zeichner, 1993, 2003). In addition to variation in the content of teacher education program orientations or conceptual frameworks there are a number of other aspects to the variation in these orientations such as how clearly defined or elaborated the orientations are, how widely they are shared among teacher educators in the program including school-based teacher educators (Barnes, 1987), and the degree of commitment to them by those who affiliate with them. For example just because programs claim to be organized around slogans such as teachers as decision makers or teaching for social justice does not mean that they have similar orientations (McDonald & Zeichner, in press). It depends on what these terms actually mean in particular contexts when they are elaborated and enacted.

Teacher education programs that undergo the process of accreditation by the National Council for Accreditation of Teacher Education (NCATE) are required to articulate a conceptual framework for their teacher education programs. Although no one has published an analysis of the frameworks that NCATE approved institutions have used to organize their programs, periodically frameworks that organize teacher education programs are reported in the literature as part of descriptions of programs or studies of aspects of particular programs. In recent years, we have seen programs that have been organized around a commitment to such things as teaching as principled practice (Mills College, Kroll et al., 2005), and teaching for social justice (UCLA, Oakes & Lipton, 1999). Although it is fairly easy to gather together the teaching standards used by teacher education programs to evaluate their students, we don’t have a good picture currently of the conceptual orientations that are connected to these standards in programs across the nation.
The admissions process
The next aspect of this model for thinking about teacher education programs is the admissions process, the specific requirements and procedures that are used by faculty to decide who is allowed to enter a program. There are at least two aspects of admissions that need to be considered: (a) the relationship between admissions criteria and processes and the stated mission or conceptual framework for a program; and (b) how selective the program is on these criteria (e.g. highly selective, not selective). For example, if preparation for teaching for social justice is the expressed mission of a program, how is the potential of individuals to enact this vision of teaching considered in admissions to the program?

The curriculum
Another dimension of teacher education programs is their curriculum. Here one can distinguish programs according to a number of factors such as the amount of emphasis placed on different components of the curriculum such as subject matter preparation and preparation in pedagogical knowledge as well as the amount of time spent in supervised clinical experiences. Programs also differ in the way these various components are placed within the teacher education program (Tom, 1997). For example, the coursework and fieldwork candidates experience prior to assuming full responsibility for a classroom is one aspect of the curriculum that often distinguishes programs from one another with the growing prevalence of “fast track” alternative programs. One can also ask about the strength of the connection between the curriculum of a program and its stated mission as well as the academic rigor of the curriculum. For example, to what degree has the vision for teaching and learning guiding the program been transformed into clear performance standards and assessment criteria? What are the cognitive demands made upon candidates in readings, assignments, and assessments?

Recently Steiner and Rozen (2004) have criticized teacher education programs in university colleges and schools of education for not including a variety of viewpoints, but especially conservative ones, on different issues in required coursework. Apart from the accuracy of these charges and the desirability of the kind of curriculum they propose, the issue of the inclusion of different perspectives on issues is certainly an aspect of curriculum along which programs vary.

Another aspect of the teacher education curriculum that should be taken into account is the way in which certain substantive issues are addressed. For example, with regard to an important issue like preparing teachers to teach diverse learners, what elements of diversity are included in this preparation and how is the content addressed? Taking this one example, it has become clear that programs’ claim to address student diversity vary according to how much attention is given to linguistic diversity and preparation to teach English Language Learners (Zeichner, 2003). In some programs, multicultural education includes an applied linguistics and ESL and/or bilingual teaching component while in many others it does not. We can also examine a program’s attention to specific content like preparation to teach diverse learners as to whether the content is infused into various courses and experiences, is addressed as a stand alone course or experience (e.g. a course on teaching diverse learners), or both (Zeichner & Hoeft, 1996).

Another issue is preparation in methods to teach particular subject areas. Some programs emphasize subject specific methods preparation such as courses in the teaching of mathematics and social studies, others focus on generic methods preparation for groups of candidates preparing to teach different subjects (e.g. methods in teaching secondary
school), while other programs use a combination of both approaches. Programs also vary in terms of who provides methods instruction to teaching candidates. For example, preparation to teach specific subjects like history or biology might utilize faculty in Colleges of Letters and Science who are specialists in these disciplines, School of Education faculty who are specialists in a discipline, but also usually have a K-12 education background, practitioners in elementary and secondary schools who teach these subjects, or some combination of these approaches.

A final issue with regard to curriculum is the extent to which there is a focus on teaching specific students at different age levels (e.g. a specialized middle level program) vs. a focus on general principles that apply to a broad range of age levels (e.g. an elementary education or secondary education program that includes the teaching of middle level students but is not focused on it) (Conklin, 2006).

Field experiences
With regard to the field experience component of programs, there are a number of dimensions that can distinguish programs from one another. For example, some programs include a student teaching semester while others include a year-long internship. Some programs include field experiences throughout the program while others have them only at the end. In some programs the student teaching or internship experience is completed as a teacher of record while in others it is not. Some field experiences may only be in schools, while others may include experiences with children and/or adults in the community or other settings.

There is also the issue of how closely connected the field and course components of the program are. At one extreme, supervision of candidates’ teaching is carried out by staff that is unconnected and often ignorant about the course components of the program while at the other extreme the field and campus components for programs are closely linked within the context of a professional development school or other form of school and university partnership.

Closely connected can also be defined in terms of the degree to which the classrooms in which field experiences are completed reflect the vision of teaching and learning emphasized in program courses. Hammerness (2006) describes a recent effort in Stanford’s teacher education program to take the degree of correspondence in teaching and learning between what is advocated in courses and in potential placement sites into account in choosing places for teacher candidates to complete their field experiences.

A final issue with regard to field experiences is the nature and degree of teaching responsibility provided to prospective teachers in these experiences. Programs vary according to how explicitly the requirements for field experiences are laid out before hand or near the beginning of the experience, who is involved in making the decisions about these requirements (e.g. the university only or school and university personnel together), in how much teaching responsibility is provided in an experience, and in the degree to which each field experience builds on the ones which preceded it in terms of adding more responsibility and complexity (Brouwer & Korthagen, 2003).

Instructional strategies
The next aspect of teacher education programs that should be taken into account is the teaching strategies that are used to instruct candidates. Research has been conducted on a number of instructional strategies used in teacher education programs such as microteaching, computer simulations, the use of video technology and hypermedia, case
methods, autobiography, portfolios, and practitioner research (Carter & Anders, 1996; Darling-Hammond et al., 2005; Grossman, 2005). Shulman (2005b) has criticized the great variety of instructional approaches that exist in different teacher education programs and calls for a consensus on a small set of “signature pedagogies” that would characterize all teacher education programs as he claims exist in other professions such as law and medicine.8

In addition to the variation in instructional approaches within and across programs, the same instructional approaches such as portfolios or case methods are implemented for different purposes and in different ways by different teacher educators. For example, the use of portfolios in some programs focuses on the documentation that standards have been met as opposed to an emphasis on using the portfolio as a tool for reflection about teaching in other situations. Portfolios are introduced and supported in different ways by different teacher educators. The same can be said about any instructional strategy in teacher education. When instructional approaches used in teacher education programs are studied and/or discussed the purposes toward which they are used in different settings and the conditions of their use must be considered.

One question of importance with regard to instructional strategies is the degree to which teaching strategies advocated for prospective teachers to use with PK-12 students are modeled in the teacher education classroom. Teacher education sites vary in the degree to which this modeling occurs.

Internal organizational features

The next aspect of teacher education programs is a variety of staffing and internal organizational aspects within programs including the nature of social relations within a program. Here such issues are addressed as whether or not candidates enter and proceed through a program in intact cohorts or whether they can proceed through the program in more individualized ways (Arends & Winitszky, 1996). There is also the issue of how the staff is organized to work with students. Tom (1997) has identified two patterns of staffing in teacher education programs (horizontal and vertical) that will influence how candidates experience their programs. In a horizontal staffing pattern which is organized by subject specialty,

Prospective teachers proceed from course to course, as if on an elevator moving from floor to floor. Professors of education stand at the elevator doors and dispense ideas and attitudes to the students, who methodically stop at each floor on the way to student teaching on the top floor. Teachers-in-training accept the bits of professional knowledge in the hope that they will have some value when the elevator finally arrives at student teaching.

(p. 145)

In this horizontal staffing pattern which minimizes the intellectual and practical demands on teacher educators by enabling them to focus only on one piece of the teacher education curriculum, candidates meet a different group of teacher educators at each floor who often do not communicate with each other about the contents of the different floors. The result is often a fragmented curriculum where both redundancy and absence of content are significant problems. Tom (1997) calls for a form of vertical staffing which helps bridge areas of specialized knowledge and practice. Here faculty assume responsibility for more than one course or experience in the program or for helping candidates analyze and make sense of different pieces of their program. An example of vertical...
staffing is where a faculty member is responsible for a cohort of candidates as they move through the different layers of a program helping them to make connections across the different components of the program.

In models like this, even if individual teacher educators only teach in a particular part of the program, they have knowledge of the whole program rather than only one part, and they can deliberately build coherence into the program. The knowledge that teacher educators have of the whole program and of all of its individual components is a critical dimension along which programs vary. Although the common situation especially in large programs is for teacher educators to have little knowledge of the whole program and of parts in which they are not directly involved (Lanier & Little, 1986), there are some programs like those at Alverno College in Milwaukee where teacher educators are very knowledgeable about every aspect of their programs even though they may not be directly involved in all of them (Zeichner, 2000).

Another aspect of staffing that affects program coherence is related to who staffs a program. For example, if a program relies mostly on adjunct staff or faculty or graduate students who come and go frequently, it is less likely to be able to create a coherent program with a shared vision and purpose than in a program where more permanent faculty and staff are engaged in educating teachers. In some situations though, programs that utilize adjunct staff to teach course and supervise field experiences have closely integrated these staff into the program through regular seminars and support. The University of California at Santa Cruz is an example of a teacher education institution that has closely integrated its adjunct staff into its teacher education programs.9

The common pattern in many teacher education programs in research intensive universities that prepare teacher educators in doctoral programs and where pressure on faculty to do research is particularly intense is for graduate students and/or adjuncts to assume much responsibility for the teaching and clinical supervision of teacher candidates. In situations like these, the quality of faculty oversight and mentoring of the staff that do the work of teacher education is a key to developing program coherence.

There is also the issue of coherence between the field and campus components of the program that have been mentioned earlier. A number of programs in an effort to develop stronger connections between the coursework and fieldwork have created new boundary spanning staff and faculty roles where university staff work directly in schools helping candidates to make connections between the different elements of their programs. These include placing university supervisors of student teachers and interns within specific schools (Zeichner & Miller, 1997), and doing some teaching of courses and seminars in schools where deliberate links are made between practices in the schools and concepts and practices addressed in the courses. Other programs have brought expert P-12 teachers to the university campus for a year or two as teachers-in-residence to work along side university faculty in teaching campus methods and foundations courses and in some cases subject matter content courses in the arts and sciences (e.g. Benyon et al., 2004; Post et al., 2006).

Using data to make program decisions

There is also the issue of the degree to which teacher educators use data to inform their decision making about their programs. It has been argued that there is very little use of data in making decisions about programs (Houston, 1990) and there have been recent calls for more “evidence-based practice” in the pre-service education of teachers (Fallon, 2006). Although in many programs, teacher educators conduct the often mandatory graduate follow up studies that are required by state and national accrediting agencies,
there is not always evidence that they use this data to make improvements in their programs. As was pointed out earlier, it is the use of the data rather than its generation that has been suggested as an element of effective programs.

One of us has been evaluating two sites of the Teachers for a New Era Program during the past two years and has discovered through observing teacher educators in these programs, a variety of ways in which teacher educators can use data to inform decision making about program renewal. For example, these teacher educators in these two TNE sites have conducted surveys and interviews of program graduates and current faculty, staff and students, conducted case studies of the teaching of program graduates, surveyed the research literature, and examined practices at other institutions. Essentially this use of data to inform decision making with regard to teacher education involves a much more deliberate and systematic approach to teacher education program renewal than has been common.

Structural features

In addition to these dimensions of teacher education programs typically not accounted for in research comparing the efficacy of different program models, the structural features of programs should also be considered. These include such things as whether the program is undergraduate or graduate, the length of the program, and who sponsors it. If these structural features of programs are considered in addition to the substantive program dimensions discussed above in discussions about improving teacher education programs and in research studies, these activities will begin to get at the things inside teacher education programs that truly distinguish them from one another.

We will now consider three general issues that have negatively influenced the character and quality of research about teacher education programs and teacher education program renewal efforts: the problem of ambiguous comparisons between programs, the reliance on self-descriptions of programs for an understanding of programs and the problem of unwarranted generalizations about programs that exist in multiple sites.

The problem of ambiguous comparisons

Some researchers have sought to compare what candidates learn about teaching and the quality of their teaching in programs that designate the schools where the clinical experiences take place as “professional development schools” with programs that do not do so. It is not common however, for researchers to describe these partnerships with enough specificity and in common enough ways for comparisons to be made across research studies. For example, a recent study compared the effects on the quality of teaching practice of doing practicum experiences and student teaching/internship experiences in professional development schools or non professional development schools at George Mason University (Castle et al., 2006). The researchers describe the differences in the two pathways at this university (PDS and non PDS) as one of length (a fifteen-week student teaching experience in the non PDS track vs. a year-long internship in the PDS track), the timing of methods courses (during the internship for the PDS track vs. prior to student teaching for the non PDS track), and whether the program is completed as a part time student (non PDS track) or fulltime student (PDS track). Students were admitted into the program according to the same criteria but then self-selected into either the PDS or non PDS track.

Another recently published comparison between the effects of professional development schools and traditional field placements (Ridley et al., 2005) distinguished
professional development school placements from traditional placements according to the amount of time candidates spent in field experiences and how often they were supervised by university staff. In this particular study, the PDS graduates had about three times the amount of field experience in their program as the other graduates and were supervised by university staff each semester rather than only at the end of the program like the other graduates. Although both of these studies presented data supporting that the teaching effectiveness of the PDS graduates was superior to that of the non PDS graduates on specific dimensions, it is difficult to know what the findings mean. The definitions of professional development schools used in these studies are different from each other and from other depictions of this innovation elsewhere. What are the particular aspects of these placements that influenced the higher teaching ratings? If it was just a longer field experience or more frequent supervision, these conditions can be created without having placements in a professional development school.

This comparison of one model of teacher education against another model based on only surface level information about the two alternatives being compared is very common in the literature. Castle et al. (2006) conclude their analysis with the statement that “the case may be made that PDS graduates may affect student learning sooner than traditionally trained beginning teachers” (p. 65). We need to move beyond these comparisons of alternatives that are defined differently by various researchers and use specific and similar sets of elements that define alternative approaches under investigation by researchers. The National Council of Accreditation for Teacher Education has developed a set of standards for professional development schools that could be a source from which to develop a common definition of professional development schools that can be used in both discussions and research (NCATE, 2001).

Going beyond reliance on teacher educators’ program descriptions

Another aspect of teacher education programs that should be taken into account is the difference between programs as described by teacher educators and in written materials and how the programs are enacted for different individuals. Much of the research on teacher education programs that we reviewed for the AERA panel relied on documents about programs and on statements from teacher educators rather than on first hand examination of programs in action. Relying on these secondhand sources to understand the characteristics of programs could cause problems because of the gaps that often exist between how programs are described and what they actually represent when implemented.

For example, in the Teacher Education and Learning to Teach (TELT) study conducted by researchers at Michigan State’s National Center for Research on Teacher Education between 1986 and 1990 researchers found that in one of the five-year programs in their sample, relatively few students were actually enrolled in the program for five years. Many students spent their first two years in a community college and transferred to the university in their third year and; some either could not get admitted to the graduate school for the fifth year or left to complete student teaching as teachers of record because of a severe teaching shortage in the state (Kennedy, 1998).

Another example of the gap between program rhetoric and reality is in an alternative certification program in the Houston school district where although the program was described as providing a mentor to every intern in the alternative certification program, a study of the program revealed that many of the interns had not met their mentors and in some cases did not even know who their mentors were (Stevens & Dial, 1993). Humphrey et al. (2005) also found a gap in their case studies of seven alternative certification

"PROGRAMS AS SITES FOR TEACHER PREPARATION" 283
programs between mentoring described in program documents and what candidates actually experienced. Thirteen percent of the candidates in Teach for America and eleven percent of the candidates in the New Jersey state alternative certification program reported that they received no mentor support. Researchers and others need to look beyond the claim that a practice exists in a teacher education program and investigate how that practice has been elaborated and enacted. It is in the enactment of these program elements that the features of program effectiveness will be found not in cursory statements about the presence of particular practices.

**Generalizing about programs that exist in multiple sites**

A final issue has to do with the assumption in discussions and the literature that programs that exist at more than one site are the same and provide a common preparation for teaching that can be compared to other types of preparation. The clearest example right now of this problem at the preservice level is the assumption that “Teach for America” provides a common training experience that can be compared to other preparation experiences. Here, although there is a common five-week summer institute for teachers and some support structures that exist in all TFA regions, the preparation received by TFA teachers varies considerably because they are enrolled in a variety of college and university-based and other preservice certification programs to meet the highly qualified provisions of NCLB. Because of the wide variation in the preparation for teaching received by Teach for America teachers, it makes little sense to compare TFA teachers to other beginning teachers without describing the specific nature of the preparation of the teachers being compared.

**CONCLUSION**

The conceptual framework that we have offered in this chapter provides suggestions for researchers and others to move beyond the simplistic traditional vs. alternative and other surface level comparisons that have dominated the literature and policy discussions. In conversations among teacher educators and between teacher educators and policy makers and in research studies, we need to begin to be more specific about the features of teacher education programs that we are discussing and/or studying. The various dimensions that we have just elaborated suggest particular features of teacher education programs that could lead us to better understandings of how to prepare effective teachers.

We are beginning to see a shift in two recent large scale studies of the effects of different pathways into teaching in how teacher education programs are described. In the first study being conducted by researchers at Mathematica Policy Research (Decker, 2005), teacher education programs are distinguished by their admissions processes (highly selective vs. less selective) and by the required professional education course load (minimal vs. substantial). Although this depiction of programs does not even begin to deal with the complexities of preparation that we will eventually need to understand, it is a step beyond merely labeling a program alternative or traditional.

In a second study conducted by researchers in the Teacher Policy Research Consortium at Stanford University and SUNY Albany (Boyd et al., 2006), researchers are probing more deeply into the differences among programs than has been common. In addition to taking into account various program characteristics such as program length, whether it is graduate or undergraduate, whether it uses student cohorts, faculty and student char-
acteristics, the nature of graduate follow-up, researchers are conducting in-depth examinations of the nature of preparation to teach reading and mathematics, to teach diverse learners, and the features of field experiences. Rather than relying on the surface descriptions that have dominated discussions and research, they are examining the character and quality of student assignments and assessments, noting the topics and readings that are part of the preparation in these areas.

It is obviously expensive to perform this kind of in-depth analysis of the elements of different pathways into teaching. Both the TELT and NCTAF case studies discussed earlier and these two current studies were all supported by large grants. Although it is not possible for every research study to include this kind of detailed analysis of program features, it is possible for individual studies to link themselves to particular programs of research about the nature and effects of different program characteristics and consciously build upon one another’s work, defining practices and program elements in consistent ways and even using the same instruments and methods to gather data about these practices in different contexts. As Shulman (2004) suggests, it is in these programs of research rather than in individual studies that we will be able to deal with the complexity of teacher education programs. There has been very little evidence to date of teacher education researchers consciously building upon one another’s work (Zeichner, 2005).

The complexity of teacher education programs and program elements as has been portrayed in this chapter also has implications for how discussions should be framed between and among teacher educators and policymakers. Figure 17.1 summarizes some of the factors that need to be taken into account when studying the links between teacher education, teacher learning, and student learning.

We have argued in this chapter that the meaning of a teacher education program is to be found in its substance as well as in its structural characteristics. We have further argued that with regard to the substantive aspects of teacher education programs, their meanings are to be found in the elaboration and enactment of particular program features rather than in their mere presence or absence. Just as the question of whether alternative programs are more effective than traditional programs will never be able to be answered in a meaningful way, we will never settle the question of what effects the mere presence of certain practices in a teacher education program have (e.g. portfolios, action research, professional development schools) independent of an understanding of the ways in which these practices have been defined and implemented and knowledge of the contexts in which they have been enacted. Also, the search for the universally best practices in teacher education for all types of candidates in all types of settings is likely to be a futile one.

Given the diversity of who comes in to our teacher education programs and the settings for which they are prepared to teach, there is likely to be a variety of effective pathways into teaching and a variety of elements of effective teacher education programs. The most important task that lies ahead is to ensure that elements of excellence in teacher education are present in all of these various pathways into teaching.

NOTES

1 Not all of the researchers used the same definitions of alternative and traditional programs and this definition which was originally proposed by Adelman (1986) and has been more recently used by others enabled us to make the most use of the data in the 37 studies.

2 Effectiveness in accomplishing its particular goals. As will be discussed below, there are a number of different views of what teachers need to know, be like, and be able to do.
The purpose of these case studies of teacher education programs in 29 institutions was to verify the extent to which these conditions existed in U.S. teacher education programs. Tato (1996) in her study of the impact of programs on preparing teachers to teach diverse learners distinguished the substance of programs in TELT by contrasting a “constructivist” from a “conventional” or “transmission” approach. Kennedy (1998), in her TELT study of learning to teach writing, distinguished “reform-oriented” from “traditional” programs.

According to Darling-Hammond (2000) “learning-centered” instruction refers to a focus on in-depth learning and understanding and “learner-centered” instruction refers to instruction that is responsive to students’ cultural backgrounds, experiences, needs and talents.

Because most college and university-based teacher educators are prepared for their work in the doctoral programs in research intensive universities, interventions to improve the quality of teacher education in these institutions can potentially have a widespread effect throughout higher education. Ironically, these institutions with the most troubled history with regard to teacher education (e.g. Labaree, 2004) have the major responsibility for preparing the nation’s teacher educators.

According to Darling-Hammond and Bransford (2005) for an elaboration of what Darling-Hammond believes is minimally necessary for teacher education programs to teach.

In an effort to move toward the identification of signature pedagogies in teacher education, the Carnegie Foundation for the Advancement of Teaching has initiated a new web-based collection of K-12 and teacher education teaching practices (http://gallery.carnegiefoundation.org/insideteaching).

One of us conducted an external review of the education department at the University of California at Santa Cruz a few years ago and this was one of the findings in this review.

The two sites that are being referred to here are the University of Wisconsin-Milwaukee and the University of Washington in Seattle.

In both of these professional development school/non professional development school comparisons, students self-selected into the PDS track of their program. Because of the design of these studies, there is no basis for attributing the results found by researchers to the programs as opposed to differences in the characteristics of the individuals who entered the different program tracks.

An uneasy relationship

The history of teacher education in the university

David F. Labaree
Stanford University

For better and for worse, teacher education in the United States has come to be offered primarily within the institutional setting of the university. In many ways, this came about by historical accident. In the nineteenth century, teacher education, if it took place at all, occurred in a variety of organizational settings, until the state normal school emerged in the last quarter of the century as the emergent (if not yet predominant) model. In the early twentieth century, however, this model went through a rapid evolution, from normal school to state teachers college to general-purpose state college to regional state university. Since the 1970s, teacher education has been a wholly owned subsidiary of the university.

Ironically, although teacher education was a latecomer to the university in the U.S., it was at the core of the original form of the university that emerged in medieval Europe. Early in this institution’s history, an advanced liberal arts education was primarily intended to prepare teachers. The university was then constituted as a craft guild for teachers, whose highest degrees (the master’s and doctorate) were badges of admission to the status of master teacher and whose oral examinations were tests of the candidate’s teaching ability (Shulman, 1986; Durkheim, 1938/1969). But over the years teacher education was gradually pushed from the center to the periphery of higher education, which is where it was found in the early nineteenth century when American teacher education started its long march back.

In this chapter I examine the history of teacher education in the U.S. for insight into the situation facing teacher education today. As it turns out, the relationship between the university and teacher education has been an uneasy one for both parties. There has been persistent ambivalence on both sides. Each needs the other in significant ways, but each risks something important by being tied to the other. The university offers status and academic credibility, and teacher education offers students and social utility. But in maintaining this marriage of convenience, the university risks undermining its academic standing, and teacher education risks undermining its professional mission. I explore some of the central issues that surround this awkward relationship: the centrality of teacher education’s status problem in shaping its relationship with the university; the roots of this problem, both in the market pressures that shaped teacher education’s history and in the problems of practice that shaped its professional role; the status politics that shaped the situation of teacher education within the university; and the differences in the relationship between TE and university that come with the latter’s location in the university status order.
Teaching existed long before teacher education. In the years preceding the emergence of the normal school in the mid-nineteenth century and continuing afterward, prospective teachers in the U.S. followed many routes into the classroom. In general, the assumption was that anyone who had completed a given level of education could turn around and teach it. Teachers needed no special preparation in the art of teaching; they just needed modest familiarity with the subject matter they would teach. This lack of formal training in pedagogy was not unique to teaching. Before the twentieth century, most professionals did not learn their craft by enrolling in a program of professional education but rather by pursuing an apprenticeship with an experienced practitioner. What was distinctive about the preparation of teachers, however, was that it involved neither formal instruction nor informal apprenticeship. Instead, the rule was simply: take the class, teach the class.

EARLY FORMS OF TEACHING AND TEACHER EDUCATION

In early nineteenth century America, education took place in a wide variety of settings: home, where children acquired basic literacy and numeracy skills; church, where children learned via sermons, study groups, and Sunday schools; a variety of lyceums and public lectures; apprenticeships, which required the master artisan to provide some general education as well as trade craft; dame schools, in which students learned elementary skills in the home of a neighbor; private tutors; private schools relying on tuition; free schools for paupers operated by the local municipality; public schools in New England towns; academies, providing secondary education; and colleges, operating preparatory departments. The setting determined the identity of the teacher, who could be any of a number of persons: a parent, a preacher, a master craftsman, an association leader, an adult in the neighborhood, an itinerant tutor, a private contractor, a town official, a corporate employee, or a college professor.

The arrival of the common school in the 1830s initiated a process of simplifying this complex structure of education and making it look more like the system we have today. The emerging model was the community elementary school, operated by local public officials and supplemented over time by a grammar school and a high school. In this new structure, teachers were public employees, appointed by a school board acting as the agent for the community. The criteria for hiring teachers varied. Perhaps the most important characteristic was the ability to maintain order among the students (Sedlak, 1989). It also helped if the candidate was local and needed the work. As for educational qualifications: at the very least, you needed to have completed the level at which you would be teaching. As standards increased over time, the educational requirement became completion of the level above that. Grammar school graduates thus were viewed as prospective elementary teachers, and high school graduates as grammar school teachers. College students often taught in the summer, and college graduates frequently taught for a while until something better came along.

With the development of the common school system, however, came the first effort to establish a system of formal preparation of teachers for these schools. Leaders of the common school movement, like James Carter, Horace Mann, and Henry Barnard, were also strong advocates for teacher education. One innovation that became prominent during the middle of the century was the summer teacher institute, which was a set of lectures and classes aimed at developing the skills of teachers in both pedagogy and subject matter. These institutes constituted a form of on-the-job training for teachers, the
first formal effort to provide teachers with professional development opportunities. They typically took place during the summer, over a period ranging from one to eight weeks, usually organized by the county school superintendent or a group of school districts (Mattingly, 1975).

THE NORMAL SCHOOL

The major teacher education initiative that came out of the common school movement, however, was the state normal school. One reason for this was the sharp increase in the demand for teachers that arose with the adoption of the common school model. In place of the vast array of mechanisms for providing instruction that marked education at the start of the nineteenth century, the common school system established a single standard model, the publicly operated community school. The process of creating these schools all over the country produced an enormous and continuing shortage of teachers who could be employed to occupy the new classrooms. The normal school was to be the primary means of providing these teachers. However, the common school movement generated not only a demand for teachers but also a demand for higher teacher qualifications.

When education shifted from an ad hoc and voluntaristic mode of delivery to a systematic and publicly sponsored form, teaching became a kind of public trust, which required systematic training and professional certification for teachers in order to insure that they were capable of meeting their new public responsibility for educating the nation’s children. As their name suggested, normal schools were expected to set the standard—the norm—for good teaching.

Normal schools took a variety of forms. Major cities set up their own normal schools, or normal departments within the high school, in order to train teachers for the local system. Often counties established normal schools to feed into their own school districts. But the most prominent and ultimately most influential form was the state normal school, the first of which opened in Lexington, Massachusetts in 1839. The state normal school, which started out at the level of a high school, was a single-purpose professional school for future teachers. In order to accomplish this end, the curriculum had to be a mix of liberal arts courses, to give prospective teachers the grounding in subject matter they had not received in their earlier education, and professional courses, to give them a grounding in the arts of teaching. Initially the course of study lasted for one or two years.

In the eyes of reformers like Mann, the primary aim of the state normal school was to prepare a group of well educated and professionally skilled teachers who could serve as the model for public school teachers throughout the country. Here is the way Cyrus Pierce, the founder of the Lexington normal school, put it in a letter to Henry Barnard:

I answer briefly, that it was my aim, and it would be my aim again, to make better teachers, and especially, better teachers for our common schools; so that those primary seminaries, on which so many depend for their education, might answer, in a higher degree, the end of their institution. Yes, to make better teachers; teachers who would understand, and do their business better; teachers who should know more of the nature of children, of youthful developments, more of the subject to be taught, and more of the true methods of teaching; who would teach more philosophically, more in harmony with the natural development of the young mind, with a truer regard to the order and connection in which the different branches of knowledge should be presented to it, and, of course, more successfully.

(Borrowman, 1965, p. 65)
This was a noble professional mission for the normal school; one can hear echoes of it in the debates about today’s university-based schools of education. But it directly conflicted with the other main purpose of the normal school, which was to fill empty classrooms with much-needed teachers. It is hard to see how the normal school could have satisfied both of these aims at the same time. From the very beginning, it was caught in a classic bind between quality and quantity. It could provide a few model teachers with a high degree of professional training; or it could provide the large number of teachers needed for the expanding common school system by skimping on professional preparation. It could be professionally strong but functionally marginal, leaving the vast majority of teachers to reach the classroom with less rigorous training; or it could be professionally weak and functionally central, turning out large numbers of graduates with minimal preparation.

It should surprise no one that normal school leaders ended up choosing relevance over rigor. Doing otherwise would have been difficult. To preserve academic rigor would have meant opting for professional purism over social need; it would have meant leaving mass teacher preparation to less qualified providers; and it would have meant depriving their institutions of the funding, power, and opportunities for expansion that would come with making themselves useful. As I examine in more detail later, this same debate about the role of teacher education continues today. Schools of education at elite universities generally have opted for rigor over relevance, with boutique teacher education programs that provide academically credible preparation for a small and highly selective group of students. But schools of education at regional state universities—the heirs of the normal schools, which reside at the bottom of the university status order—have opted for programs that mass produce teachers to fill the continuing demand in schools. This tension between rigor and relevance, it seems, is endemic to teacher education, and criticisms customarily descend on the heads of education schools for erring in both directions. A recent report by Arthur Levine (2006), Educating School Teachers, is only the latest in a long line of polemics that lambaste the university school of education for being both academically weak and professionally irrelevant.²

Under these conditions, the number of state normal schools grew rapidly. After their start in 1839, they grew to 39 in 1870, 103 in 1890, and 180 in 1910 (Ogren, 2005, pp. 1–2). Enrollments at public normal schools (which included a few city and county normals) grew from about 26,000 in 1879–80 to 68,000 in 1899–1900 and 111,000 in 1909–10 (Ogren, 2005, Table 2.1, p. 58). This rapid increase had the effect of dramatically lowering both the status of these institutions and the quality of their programs, a point I develop later. Even though they were running hard to catch up with the demand for teachers, by the end of the century normal schools still had not been able to do so. As David Tyack has pointed out, “By 1898 the number of public normal schools had reached 127, with about the same number of private ones. But all the normal schools together graduated no more than one-quarter of the new teachers” (Tyack, 1967, p. 415).

THE EVOLUTION OF THE NORMAL SCHOOL INTO THE REGIONAL STATE UNIVERSITY

At the same time that normal schools were under pressure to meet the demand from school districts for more teachers, they were also experiencing another kind of demand, this coming from their own students. If the first kind of pressure sought to turn normal schools into teacher factories, the second sought to turn them into people’s colleges.

From the perspective of their students, normal schools were more than just a way to
become a teacher. They were also a way to acquire a local, affordable, and accessible form of higher education. Private colleges were expensive. State universities were almost as expensive, they were usually far away, and gaining admission was not easy. But normal schools were less expensive; they were located at geographically accessible points around the state, allowing students to commute and thus keep down living costs; and admission was easy. The only problem was that normal schools focused entirely on preparing students for a single occupation, teaching. But on this point, it turns out, the normal school was prepared to be flexible. It really had no choice.

Like American higher education in general, both then and now, state normal schools were dependent on student tuition. They received appropriations from state government, but these funds were only adequate to support a portion of the costs of educating students. The rest had to come from tuition. With money comes power. In order to survive and prosper, normal schools needed to keep attracting student tuition dollars, which meant competing with other higher education providers in their market area to offer students the kinds of educational services they wanted. What these consumers wanted was not a single, narrowly-defined program for preparing teachers, but instead an array of programs that offered broad access to a variety of possible jobs. They did not want a normal school; they wanted an open-access liberal arts college. Adapting to this consumer demand was mandatory for the normal schools; if they failed to do so, students would go to competitor institutions that had already made the adjustment. And adapting to this demand was also relatively easy. In order to provide prospective teachers with the subject matter knowledge they needed, normal schools already had a group of professors who were teaching history, English, math, science, and the rest of the core liberal arts curriculum, in addition to courses in pedagogy. It was thus a simple matter for normal schools to supplement their core teacher education program with a series of programs of study that drew on these liberal arts courses. And that is what they did.

In his book *And Sadly Teach*, Jurgen Herbst (1989) describes in detail the process by which normal schools gradually abandoned their commitment to professional education and allowed themselves to be lured into mimicking the liberal arts college. For proponents of high quality professional education for teachers, this is not a pretty story. But for those who see education as an important way to allow individuals to get ahead in society, it is a heartening tale of expanding educational opportunity and social mobility.

As was the case when normal schools expanded to meet the demand from school districts for more teachers, they were just doing what people wanted them to do. The market spoke—first employers, then consumers—and normal schools responded. Depending on one’s point of view, this response may or may not be admirable, but it is certainly understandable.

The evolution of the normal school into a people’s college helps explain the rapid expansion and proliferation of these institutions in the late nineteenth century. It also helps explain why this expansion was insufficient to meet the demand for teachers, since an increasing share of the normal school student body was there to pursue other professional goals. But the process by which the normal school adapted to consumer pressure from students did not stop with the development of a multipurpose institution. If students wanted the normal school to be a local, inexpensive, and accessible form of a liberal arts college, then it made no sense to stop with the addition of a few new programs. After all, the normal school was still more high school than college, so it could not provide the kind of social mobility opportunities that a real college could. Students wanted college status for the normal school, and so did its faculty members and administrators, all of whom would benefit from being able to ride this institution to a higher level in the educational system. The same was true of members of the community surrounding the
normal school, local legislators, and also communities that were hoping to open new such institutions in their own areas.

Given the array of constituencies supporting this elevation, it was inevitable that by the start of the twentieth century state legislatures would begin transforming normal schools into teachers colleges, and between 1911 and 1930 there were 88 such conversions (Tyack, 1967, p. 417). With this change, the former normal schools could grant bachelor's degrees, giving heft and credibility to all their programs. But the process did not end there. These teachers colleges had already diversified their programs, turning themselves into de facto liberal arts colleges, with teacher education playing a smaller role in the curriculum every year. So it made sense to recognize this fact, remove the word “teachers” from their letterhead, and change to a more generally recognized and marketable label, “state college.” This started happening in the 1920s, and by the 1950s the last of the normal schools were formally disappearing from the scene. Finally, this process of institutional evolution reached its culmination in the 1950s, 1960s, and 1970s, when one after another of these former normal schools took the last step by seeking and winning the title “university.” In the century-long race to adopt the most attractive institutional identity, being a college was no longer good enough; only becoming a university would do. The large majority of the old normal schools followed this route—from normal school to teachers college to state college to state university—with only minor variations in labeling and timing. For example:

State Normal School, Albany, NY, 1844; State Normal College, 1890; State College for Teachers, 1914; State University College of Education, 1959; State University College, 1961; State University of New York at Albany, 1962.

State Normal School, Millersville, PA, 1859; State Teachers College, 1927; State College, 1959; Millersville University of Pennsylvania, 1983.

State Normal School, Mankato, MN, 1868; State Teachers College, 1921; State College, 1957; State University, 1975; now Minnesota State University, Mankato.

Northern State Normal School, De Kalb, IL, 1899; Northern State Teachers College, 1921; Northern State College, 1955; Northern State University, 1957.

State Normal School, Montclair, NJ, 1908; State Teachers College, 1929; State College, 1958; Montclair State University, 1994 (Ogren, 2005, appendix).

An alternate route: education in elite universities

There was another route that brought teacher education into the university, this one much more direct though much less common. In the late nineteenth century, universities started adding chairs in pedagogy or education. These were flagship state universities and private universities, which were destined to occupy the top tier in the emerging hierarchy of higher education in the twentieth century (with the former normal schools, now regional state universities, occupying the lower tier). Historians generally give University of Iowa credit for establishing the first permanent professorship in pedagogy in 1873 (Tyack, 1967, p. 415; Clifford & Guthrie, 1988, p. 62), but University of Michigan claims this honor for itself with a chair established in 1879 (University of Michigan, 2005). Others quickly followed: Columbia (Teachers College) in 1887; Chicago, Stanford, and Harvard in 1891; Berkeley in 1892; and Ohio State in 1895 (Clifford & Guthrie, 1988, pp. 62–63). Education began at these institutions as individual professorships and then quickly evolved into departments and finally schools or colleges of education. The latter stage arrived at Ohio State and Iowa in 1907, Berkeley in 1913, Stanford in 1917, Harvard in 1920, and Michigan in 1921 (Clifford & Guthrie, 1988, p. 64).

These education schools saw themselves playing a markedly different role from the one
assumed by normal schools (Powell, 1976). Whereas the latter focused on meeting the
central needs of an expanding education system, by preparing a large number of teachers
for the elementary schools, university education professors focused on the preparation of
a much smaller number of high school teachers and school administrators and on the
production of educational research. Not by accident, the large majority of these uni-
versity education students were men, whereas most normal school students were women.
This sharp divergence in mission laid the groundwork for the continuing dichotomy in
education roles that characterizes the contemporary university, with education schools at
former normal schools going one way and those at elite universities going another. I will
have more to say about that issue later in the chapter.

Converging on a canonical model

By the 1960s, through the diverse processes I have outlined here, teacher education in
United States had stumbled upon a model of organization that quickly became canonical.
Teacher education, it turned out, was going to be carried out within a university, under
the leadership of professors in a school or college of education located there. By this time,
the former normal schools had evolved into universities, and once they achieved this
status they naturally imitated the structure of existing universities by setting up education
schools and then assigning them the work that had once constituted the normal school’s
entire mission, preparing teachers.

In allowing itself to become incorporated within the university, teacher education was
just following in the path of the other more prestigious professions. As I noted earlier,
until the late nineteenth century the primary route into all of the professions was
apprenticeship (Brubacher & Rudy, 1997). A prospect would work out an arrangement
with an experienced practitioner: to learn by doing, in the manner of an apprentice
carpenter or shoemaker; and to study the books in the practitioner’s library. The trad-
titional high professions—clergy, law, and medicine—have had a place in university
faculties from medieval times to the present, but only the pinnacle of the practitioners in
these professions studied there; the large majority had always followed the route of
apprenticeship. By the eighteenth and nineteenth centuries, colleges and universities were
providing the liberal component of the education of the high professions, but apprentice-
ship was still the means of acquiring the skills of professional practice. Gradually, indi-
vidual practitioners started specializing in professional preparation, gathering groups of
apprentices together into what amounted to proprietary professional schools. Then, in
the last quarter of the nineteenth century, universities started establishing formal profes-
sional schools that incorporated both academic study and guided practice, and this
spelled the beginning of the end of independent professional preparation.

The university was emerging as a powerful new form of American higher education
during this period (Veysey, 1965). As Clark Kerr (2001) has noted, it combined the
British college, which focused on undergraduate education, with the German graduate
school, which focused on advanced studies and research, and then added the American
land grant college, which focused on practical-vocational education. In this setting, pro-
fessional schools were a natural addition, drawing on the German and American ele-
ments to produce a graduate school for practice. And the growing prestige of the new
university made it attractive for prospective practitioners to start seeking professional
education there instead of through apprenticeship. By 1900, more than 10 percent of
doctors, lawyers, clergymen, and college professors had received training at a university
professional school (Brubacher & Rudy, 1997, p. 383). Abraham Flexner’s 1910 report
on medical education set off a cascade of demands for reform of professional education
more generally, seeking to improve the quality of this preparation by reinforcing the connection with the research university. Soon it became difficult and eventually unthinkable for professional schools in any major field to exist on their own. Only schools for training practitioners of the lesser trades—like cosmetology and truck driving—could survive independently. For teacher education, as with other programs of professional preparation, there was really nowhere else to go but the university.

Teacher education and the university: the nature of the relationship

This is how teacher education ended up in the university. Now we need to explore the kind of home it found there: the nature of the relationship between the education school and the larger institution, and the consequences of this arrangement for both parties. In particular, I focus on the kind of exchange that has been involved in maintaining this relationship. As I suggested at the beginning, the university provides status and academic credibility for its part of the bargain, and in return teacher education provides students and social utility. Below I explore the terms of this exchange: the roots of teacher education’s status problem, the programmatic and professional consequences of using university status to remedy this problem, and the significant differences in the nature of the bargain with education at elite universities vs. regional state universities (the former normal schools).

Education’s status problem

Teacher education has long suffered from low status. Everyone picks on it: professors, reformers, policymakers, and teachers; right wing think tanks and left wing think tanks; even the professors, students, and graduates of teacher education programs themselves. In part this status problem is a legacy of the market pressures that shaped the history of the normal school; in part it is a side effect of the bad company that teacher education is seen as keeping; and in part it is a result of the kind of work that teachers and teacher educators do. Let us consider each of these in turn.

Legacy of market pressures

At the core of teacher education’s status problem are the market pressures that shaped the history of the normal school. One kind of market pressure came from employer demand. There was a seemingly endless call for warm bodies to fill the ever expanding number of classrooms in a school system that was increasing in size both horizontally (incorporating the entire age cohort) and vertically (extending the school career from elementary school to grammar school to high school). Normal schools expanded to meet this demand, and in doing so they necessarily relaxed professional standards for teacher preparation. This meant making teacher education easy to enter, short in duration, modest in academic rigor, and inexpensive to maintain. The normals were being asked to turn out large numbers of teachers at low cost and with minimal qualifications, and they did so. But, of course, being accommodating in this manner sharply lowered their institutional status. And this stigma has stuck with teacher education as it migrated into the university, where it has retained the reputation for being an academically weak program produced on the cheap for students of modest intellect.

Another kind of market pressure on teacher education came from consumer demand. Students entering the normal school wanted a credential that would open a much wider
array of occupational doors than a simple teaching degree, and the normal school obliged by expanding programs and evolving into a college and then university. In the process of doing so, however, the normal school had to abandon its focus on the professional preparation of teachers. Teacher preparation became increasingly marginal within the expanding college and university context. No longer the centerpiece of the institution as it was in the normal school, education was now just one school among many; and the responsibility for teacher education itself became diffused across the entire university. Prospective teachers acquired general education and knowledge of the school subjects they would teach in departments elsewhere on campus, leaving the education school with responsibility only for courses in pedagogy. Thus the evolution into a university meant that the normal school lost both its professional mission and its control over the education of teachers. This left the university education school with a function that seemed vestigial. It looked like the “real” education of teachers in academic subject matter took place elsewhere, whereas the education school seemed responsible only for the vocational side of things—teaching lesson planning and classroom management, and supervising student teachers. In the status hierarchy of the university, which values the academic over the vocational and the theoretical over the practical, this put education on the lowest tier.

Bad company

Another source of teacher education’s low esteem is the apparently bad company it keeps. Teacher education serves stigmatized populations, as defined by gender, class, and age. This is a problem, since professions derive much of their esteem from the quality of their associations. For one thing, the emergence of the common school movement quickly turned teaching from men’s work into women’s work. In part this change was ideological, grounded in a vision that nurturing the young was best handled by women. In part it was practical, grounded in the need for vast numbers of teachers, and the understanding that women were willing to work at half the pay demanded by men. Becoming defined as women’s work has never helped the status of an occupation.

In addition, teaching was not an exclusive profession but more like a mass occupation. As such it drew a large number of practitioners from the working class and lower middle class, whereas the more esteemed professions drew aspirants from the higher classes. At the same time—unlike the prestigious professions, whose clients were among the more elevated members of society—public school teaching expended its efforts on behalf of a clientele of students who were concentrated at the lower parts of the social spectrum. As the most accessible of the professions serving the least advantaged members of society, teachers—and the programs for preparing them—carry a stigma of class.

Finally, there is the issue of age. If professionals earn part of their status from the status of their clients, then teaching’s focus on children works against it since adult clients carry more cachet. Doctors, lawyers, accountants, and architects deal primarily with adults; even if a doctor has a child as a patient, the clients are the parents. The rungs in the status ladder of teaching correspond to the age of the student, with professors in graduate programs at the top and early childhood educators at the bottom. Elementary teachers are just a rung above the latter and high school teachers a rung above that.

The nature of the work

A third factor in the low status of teacher education is the nature of the work that teachers do. Teaching is an extraordinarily difficult job that looks easy, which is a devastating combination for its professional standing and for the standing of its professional
educators. Why is teaching so difficult? One reason is that teaching cannot succeed without the compliance of the student. Most professions can carry out their work independent of the client; surgeons operate on the anesthetized and lawyers defend the mute. But teachers can only accomplish their goals if students are willing to learn. They exert their efforts to motivate student compliance in the task of learning, but they cannot on their own make learning happen.

Compounding this problem is the fact that students are generally in the classroom under duress. Pressure from parents, truancy laws, and the job market bring them and keep them there. But unlike the clients of most professionals, they are not contracting with the teacher to deliver services that they themselves want. Add to this another complication, which is that teachers usually carry out their practice under conditions of isolation, in a self-contained classroom where they are the only professional and only adult in the room. Finally, teachers have to function in a situation in which they lack a proven technology that works, a clear definition of success, or even a definite fix on the identity of the client (who can be construed simultaneously as the student, the parent, and the community).

Teaching is therefore a very difficult form of professional practice, which makes teacher preparation equally difficult. Complicating this challenge, however, is the general perception that teaching is actually easy. As Dan Lortie (1975) has explained and generations of teacher educators continually rediscover, one reason for this perception is that teaching is extraordinarily visible. We all undergo a 12-year apprenticeship of observation in the elementary and secondary classroom, watching teachers on the job. Compared to our knowledge about other professions, whose work we encounter only occasionally and whose workings we see only obliquely, we think we really know what teaching is all about: maintaining order, asking questions, grading tests, assigning work. As a result, prospective teachers think they know how to teach before entering teacher education programs, which allows little authority or esteem for these programs. In addition, teaching appears to be a natural skill rather than one that one needs to learn through a rigorous program of professional education. We think of it as something that individuals either have or they do not have: a way with kids, a confident and forceful personality. Whatever it is, no one can really learn it in a teacher education program. Finally, teaching is a rare profession in which practitioners succeed by making themselves dispensable. Most professions rent their expertise, which requires clients to return every time they need help. But teachers give away their expertise, by showing children how to learn on their own. This makes the skills of the teacher seem transparent and ordinary, whereas the skills of other professionals seem obscure and remote. If teaching is this difficult and if it appears this easy and commonplace, there is really little need for, and no special esteem associated with, the work of preparing teachers.

In light of all these factors, teacher education’s status problem is understandable. It bears the legacy of a historical evolution that undermined its commitment to professionalism and marginalized it within a university setting where it is given little respect; it lacks the high status associations that enhance the prestige of the major professions; and it is stuck with problems of professional practice that are overwhelmingly difficult but that earn it little public credit. Under these circumstances, the advantages for teacher education in migrating from the normal school to the university seem compelling, as compelling as the advantages that lured European peasants to Ellis Island. In status terms, there seemed to be everything to gain and nothing to lose.
The exchange: its costs and benefits

Benefits to education

Teacher education desperately needed a status boost, and the university had status to spare. So to incorporate the former into the latter seemed to provide the answer to teacher education's big problem. By making this move, normal school teachers became university professors, teacher candidates became university students, and education schools assumed a proud place alongside law schools and medical schools. Teachers would now enter the profession with the blessing of the most potent credentialing institution of the modern era.

Not only would this connection with the university grant teacher education the status it craved; it would also imbue this program of professional preparation with the academic credibility it had so sorely lacked in the days of the normal school and teachers college. By the twentieth century, the university had a monopoly on the highest levels of learning. It was the place that brought together the top experts in their fields, who generated the most important forms of new knowledge, and who taught this knowledge to the leaders of the next generation. Being there meant that education school faculty members were now anointed the experts in their domain, who could be trusted to develop the knowledge base for the whole field of education and then imbue this knowledge into the newly emerging members of the teaching profession.

Benefits to the university

Bringing teacher education into the university offered great benefits to the education, but what was in it for the university? One benefit was that teacher education brought with it a large number of students. Like the rest of American higher education, the university has long been heavily dependent on tuition to pay the bills. This is most obviously the case with private institutions, but it holds for public institutions as well. State appropriations pay only part of the cost of running a public university, so student tuition is crucial for its ability to maintain itself and to expand. And state appropriations themselves are usually prorated according to the number of students. So no university can afford to ignore a large pool of potential students who could contribute to the institution’s greater welfare. Teacher education offers such a pool. Teaching is by far the largest of the professions, so the demand for teachers, and thus for teacher education programs, is substantial and enduring. Even today, after a long period during which the number of students enrolling in higher education has expanded much faster than the number of openings for new teachers, teaching still employs about 15 percent of all college graduates every year. That is a market that is too big to pass up.

What makes teacher education so attractive to universities, however, is not only the numbers of students it brings but their low cost. Universities have long treated teacher education as what has come to be known as a “cash cow.” In these programs, if one is not too punctilious about maintaining high professional standards, an education school can generate a nice profit for the rest of the university. This is possible if the school keeps class sizes large and faculty salaries low, and if it dispenses with the need for the kinds of expensive laboratories and extensive libraries and intimate seminars that drive up the costs in more prestigious programs.

Of course greater numbers of students, by themselves, are not necessarily beneficial for a university, even if the costs are low. Elite universities are careful to limit access in order to maintain exclusivity and thus drive up the exchange value of their credentials.
Opening the doors to a flood of education students, especially if this means lowering academic standards, would be counterproductive to this strategy. But even in this elite sector of higher education, teacher education has its advantages. For one thing, it provides support for a number of large academic departments, whose graduate programs offer prestige to the university but whose undergraduate programs are often unattractive to potential majors. Programs in English and history and music and art, for example, benefit greatly by being able to offer potential majors the possibility that they could actually make a living in this field by teaching the subject at the secondary level. For these departments, it is critical to have a viable and sizeable teacher education program on campus.

For the university more generally, teacher education helps out with another related problem: relevance. Prestige accrues to a university for having the most advanced graduate programs and generating the most esoteric research. But public support for the university depends on being able to make a claim for its public usefulness. Legislators and voters want to know what benefits the state gains through its support of the university. One of these benefits is providing access to higher education for the state’s young people, which means that the university cannot take the pursuit of exclusivity too far. It pays to have some open access programs for ordinary folk, programs like teacher education that have traditionally provided easy entry into higher education. Another public benefit the university can claim is that through education it makes a contribution to solve pressing social problems in the state. The work of education school faculty members can support this claim, both as researchers exploring educational problems and as teacher educators preparing teachers for the state’s schools.

This analysis points back to Clark Kerr’s insight about the kind of balance that is so critical to the American university. This institution needs to combine the British focus on the undergraduate college (providing a basic college education for a large number of tuition paying students), the German focus on research and advanced graduate study (providing the advanced knowledge and highly selective graduate programs that are so critical to university status), and the American focus on vocational-professional education and practical problem solving. Teacher education thus helps the university with the first and third components of this triad, by providing a large number of undergraduates and a strong practical-vocational rationale, both of which serve to support (both financially and politically) the other component, those prestigious and costly graduate programs. What makes the university work is striking the right balance between the elite on the one hand and the populist and the practical on the other, and teacher education is key to achieving this balance.

Costs to education

The primary price that teacher education pays for its affiliation with the university is the potential loss of its professional mission. This is the Faustian bargain identified by critics of the university school of education like Herbst (1989) and Clifford and Guthrie (1988), in which the education school accepts university status in exchange for its professional soul. As we have seen, this bargain took form early in the history of the normal school—when normal schools agreed to expand beyond their ability to preserve high quality professional programs, and when they adapted to consumer pressure by increasing academic programs and marginalizing teacher education. By the time normal schools became universities in the mid-twentieth century, the terms of the deal were already in place. The last stage in this evolutionary path simply formalized the situation, making education just one school among many and assigning it a supporting role in the larger university enterprise (to provide low cost students and a practical rationale).
Costs to the university

The most significant potential cost of this bargain for the university is that incorporating teacher education can undercut its own academic credibility and thus institutional status. The university in general has unassailable standing in the American educational scene. But individual universities operate in an extraordinarily competitive environment, in which they much constantly attend to the possible loss of their position in the academic hierarchy. This is a main theme of Jerome Karabel’s book on the history of admissions at Harvard, Yale, and Princeton in the twentieth century (Karabel, 2005). All three institutions were running scared during this entire period. They were afraid of being pushed aside by one of their longstanding competitors (like the other ivies) or by an upstart (like Stanford or NYU). Universities look like they have status to burn, but the market in higher education means that they have to worry constantly about losing position to their peers. This means that they cannot afford to preserve academically weak programs, even if these programs offer great ancillary benefits. Therefore teacher education is on the radar of every university administrator. As a weak program with benefits, it is useful to have around as long as it is not embarrassing; but its position in the university is never completely secure. As we will see next, however, this is particularly the case with universities at the top of the pecking order.

Different bargains at the top and bottom of the university status order

As we have seen, university schools of education came about through two different mechanisms—evolution into a university, from normal school to teachers college to state college to state university (the route followed by Millersville, Mankato, and Montclair), and evolution within a university, from chair to department to school of education (the route followed by Harvard, Michigan, and Berkeley). These differences in origin have carried over to the present as differences in orientation. Education schools at regional state universities, many of which evolved from normal schools, focus primarily on the preparation of future teachers and the professional development of current teachers, and they maintain close connections with the profession and the schools; they devote little time to doctoral study or research. Their identity is clear: they are professional schools. As a result, in general they tend to be professionally strong but academically weak. On the other hand, education schools at top-ranked universities focus primarily on doctoral programs and research; they spend relatively little time preparing teachers or maintaining ties to the profession and the schools. Their identity is more academic than professional, since they construct themselves more as graduate schools of educational studies than schools of teacher education. As a result, in general they tend to be academically strong but professionally weak. Overall, education schools tend toward one pole or the other in these terms, with relatively few occupying the middle ground.

These two types of education schools present strengths and weaknesses that are mirror images of each other. In theory, therefore, both would seem to be at risk of appearing misplaced at the university, each in its own way. Education schools at the regional state universities make a clear case for their inclusion in the university on professional grounds (they are unquestionably professional schools of education), but their weakness in research and advanced degree programs calls into question their suitability on academic grounds. Conversely, those at elite universities make a clear case for their inclusion in the university on academic grounds (they devote nearly all their energies to enhancing their
scholarly credibility); but their weakness in teacher education and in connections with 
schools calls into question their suitability on professional grounds.

In practice, however, only one of these types of education schools is truly at risk of being 
drummed out of the university, and that, ironically, is the education school at the pinnacle. 
Consider recent history. Education schools were eliminated at Yale and Johns Hopkins in 
the 1950s, Duke in the 1980s, and Chicago in the 1990s. This almost happened at Berkeley 
in the 1980s, at the same time that there were scares at Michigan and Stanford. Meanwhile 
education schools at regional state universities have remained unthreatened.

The reason for this striking difference in viability is in the differences in the bargain 
struck between the education school and the university at the opposite ends of the status 
ladder. At the low end, education schools bring the expected benefits to the university: a 
large number of low-cost students (regional state universities produce the large majority 
of the country’s teachers) and a strong reputation for relevance to community concerns. 
The modest academic reputation of these schools is not a problem, since universities at 
this level have only a modest academic reputation themselves. These universities there-
fore have less status to lose by including education; like education, they justify their 
programs more on practical than academic grounds. At the same time, these education 
schools have less status to gain from the exchange. This means that, unlike their counter-
parts at the other end of the scale, they are not under compulsion to emphasize the 
academic at the expense of the professional. They do not feel the same need to sell out 
their professional mission in order to maintain academic credibility.

At the high end of the spectrum, education schools occupy shakier ground. Such a 
conclusion seems odd, at first glance, since these are the education schools with the 
strongest publication records, the biggest research grants, the most successful doctoral 
programs (measured by size, selectivity of admissions, and placement of graduates), and 
the top rankings in U.S. News and World Report. Life is good at such institutions—until 
the ax falls. The problem is that, compared with their counterparts at the former normal 
schools, they are in a situation where the university has more status to lose from its 
association with education and the education school has more status to gain from this 
arrangement. This means that these education schools have a very powerful incentive to 
abandon their professional mission in order to establish the highest possible level of 
academic credibility.

Consider the situation of today’s elite education schools in the years after World War 
II, when established research universities were desperately seeking to distinguish them-
2
- selves from the lower tier of colleges and universities, which were rapidly expanding 
in response to the G.I. Bill. They did so by visibly increasing academic standards. In part 
this meant identifying weak programs and telling them to become more academic or 
risk elimination, which made both education and business schools obvious targets on 
these campuses. Both types of schools ended up adopting the same basic strategy for 
responding to this pressure: they abandoned undergraduate programs of professional 
preparation, refocused their instructional efforts at the graduate level, drew heavily on 
aademic disciplines, and started churning out a lot of research. This strategy was mark-
edly successful for both: the universities found these reconstructed schools worthy of 
inclusion academically, and most of these education and business schools are now at the 
top of their respective fields.

But this strategy had its down side. Education schools on these elite campuses had 
established strong academic credibility, as requested, but they had done so at the expense 
of their identities as professional schools. Business schools managed to avoid this prob-
lem through the invention of the Masters in Business Administration, which they turned 
into a high status program for the professional preparation of business leaders and made
the keystone of the new business school, thereby reinforcing its connection with the profession. There has been no parallel program in elite education schools, which have focused instructionally on a variety of doctoral programs while maintaining boutique programs in teacher education. As a result, these schools have come to face another threat from the university. They may be academically strong, but they can also appear professionally irrelevant. They do serious research on education, applying the disciplines of sociology, psychology, anthropology, political science, history, philosophy, statistics, linguistics, and so on. But research universities already have separate departments in each of these areas, where scholars have the high academic standing that comes with full disciplinary credibility. So administrators can easily ask: why do we have an education school to carry out disciplinary work in education, when we have the real thing elsewhere on campus? If the school of education is not a professional school, then why do we need one? If it is neither disciplinary nor professional, it has no rationale for existence as a separate school in a research university.

Therefore, a number of these elite education schools disappeared in the last 50 years, and others escaped after a close call. Many of the survivors have learned a lesson from this experience, which is that life at the top of the rankings requires a delicate balance between the academic and professional. These education schools need to be academically strong, while at the same time maintaining a modest but credible professional profile. Watching what happened to institutions that failed to heed this lesson, deans at many top education schools have worked carefully in the last 20 years to move their institutions one or two steps in the direction of the professional without threatening their academic credibility. This has meant shoring up connections with local schools, modestly increasing the education of teachers and administrators, and augmenting master’s programs for practitioners.

Conclusions
Starting in independent professional schools 150 years ago, teacher education in the United States ended up in universities. This was not the result of a plan to enhance the quality of professional education for teachers. Instead, it was a side effect of the growing dominance of the university over all matters educational, which meant that teacher education, like other professional domains, had no other place to go. Education gained access to the inner sanctum of higher learning on terms that were not of its own making and that have been often problematic for its professional mission. In the terms of this bargain between the two parties, teacher education has ceded control over its professional programs, cooperated in undermining the professional quality of these programs, and allowed these programs to become marginalized within a university setting that grants them little respect. In return it has been allowed to bask in the glow of the university’s high status.

The effects on professional education, however, have varied according to the university’s location in the academic hierarchy. At the low end, the modest status benefits of affiliation with regional state universities have permitted education schools to maintain a relatively strong professional identity, although often at the expense of both academic and professional quality. The resulting accommodation has shown remarkable stability over time. But the same cannot be said about the situation of teacher education at the high end. Leading research universities have exerted strong pressures on education schools to pursue academic credibility at the expense of professional mission, while at the same time requiring them to maintain sufficient professional identity to differentiate themselves from the disciplines. This accommodation has been more unstable. Education
schools at these institutions find it difficult to strike the right balance of the academic and professional, since the terms of that balance vary according to time and place, and the consequences of erring too far in either direction can be fatal.

NOTES

WHAT KIND OF EXPERIENCE? PREPARING TEACHERS IN PDS OR COMMUNITY SETTINGS

Where are different groups of teachers being educated, by whom, and toward what ends? What do we know about the impact of different settings and educators on teachers’ knowledge and practice, on students’ learning and on school change? Educational researchers and policy makers are posing these questions in an effort to find optimal conditions and settings in which to prepare future teachers.

Our purpose is to compare and consider two contexts for teacher education: professional development schools (PDSs) and community oriented settings. Both contexts can be described as efforts for reform, improving student learning and teacher preparation, but they differ considerably in the kinds of experiences teacher candidates receive. Our goal is to ponder the potential of each setting to ready teachers to serve culturally diverse students and families, especially from high poverty communities, and to explore possible linkages between the contexts that promote this end.

One of us is a scholar and advocate of the Professional Development School (PDS) Movement, the other is a student and supporter of community oriented teacher education. Both of us find traditional models of teacher preparation inadequate, especially when schools and universities are separated as sites of theory and practice, or when schools and communities are disconnected as sites for student learning. However, like the contexts we consider, we perceive good teaching and learning somewhat differently.

In order to organize our comparison, we borrow from a pamphlet published by the Institute for Educational Leadership (IEL): Education and Community Building: Connecting Two Worlds (Jehl et al., 2001). In this work, IEL seeks to bridge gulf between schools and community builders, by demonstrating how school reform and community development can work in unison to benefit youth and families. IEL describes positions for each group, points out tensions between them, and, then, suggests strategies for improved working relationships. Just so, we delineate dimensions of teacher training in PDSs or community settings, indicate sticking points, and ponder intersections. We begin with a snapshot of teacher education in each setting. Next, we describe principles, perspectives, and practices for each. Last, we propose a blending of experiences for an alternative view of teacher preparation.
This school is not visionary. It thrived in the 1930s, 1940s, and 1950s. The school was the Benjamin Franklin High School (BFHS) for boys in East Harlem, New York City, and the principal was Leonard Covello (e.g., Covello, 1936; McGee Banks, 2005; Peebles, 1969). Today, similar efforts go by many names: Beacons, Bridges to Success, Caring Communities, and University-assisted Community Schools (Dryfoos, 2002). Often called full-service schools, they locate educational, social, and health services under one roof (Blank et al., 2003). Like BFHS, they tend to serve economically stressed, urban locales where the population is ethnically and racially diverse (Dryfoos, 2002).

Snapshot: a professional development school

Envision the following school. This school is a place where student’s academic achievement is uppermost. The school has forged new relationships with the university to reform teacher education and to improve student learning. University faculty can be seen in the school’s halls everyday; they teach their classes on school grounds. Teacher education faculty focus on state standards, as hallmarks of academic excellence, and teach pre-service teachers “best” practices for meeting them. Teacher candidates learn on-site, remaining at one school for several semesters and becoming well acquainted with school aims, policies, and procedures and with teachers, students, and classrooms. They collaborate with university faculty and
teachers to undertake action research projects aimed at the improvement of student learning. A problem-solving atmosphere prevails.

Parents have high expectations for their children in this school. They are satisfied with its strong focus on academics, especially when “dumbing down” of curriculum often seems the rule in high poverty schools. They look forward to regular communication with teachers, including frequent parent-teacher conferences, about the academic progress of their children. They expect higher test scores on standardized, state exams than was the rule in more traditional settings.

Teacher candidates see themselves as professionals, honing their skills in a model atmosphere, underpinned by research and aimed toward their development of expertise. They are mentored by teachers, as in conventional teacher education programs, but teacher educators mentor them as well. The school, like the medical model it emulates, is a clinical site for excellence in regard to student achievement, educational research, and teacher training.

KEY IDEAS, AND PRINCIPLES: A COMMUNITY ORIENTED VIEW

Community oriented teacher education is not easily defined because the term serves as an umbrella for diverse initiatives. For our focus, it means field placement in schools or field experiences, like service learning, in communities with culturally diverse and/or lower income populations. We examine ways in which service learning, cultural immersion, and participation in community schools impacts teacher education.

Service learning

Service learning probably is the most common effort to address community issues in teacher education. Service learning eases a community orientation into teacher education because it can be included as an “add-on” to conventional courses, without disrupting or displacing other subject matter. Service learning allows pre-service teachers to work with and learn from local youth and adults in the process of doing something worthwhile. It can foster greater comfort with people unlike oneself. And, it can cultivate the idea that teaching is public service and that teachers serve as educational leaders for an increasingly diverse public.

Many practices are identified as service learning; not all support a community orientation to teaching (e.g. Boyle-Baise, 1999; Densmore, 2000; Butin, 2003). Charitable endeavors meet immediate needs, but leave deficit views of others in tact (e.g. Henry, 2003). Tutoring helps pre-service teachers hone their teaching skills, but provides few contacts with adults and limited opportunities to understand the social context in which learners live (e.g. Boyle-Baise & Kilbane, 2000).

Critical service learning (e.g. Rhoads, 1997; Rosenberger, 2000), justice oriented service learning (e.g. Wade, 2001) or multicultural service learning (Boyle-Baise, 2002) aims to affirm diversity, build community, and question inequity. Culturally diverse and/or high poverty communities are viewed from an asset-based position: as places with resources and strengths, not only as sites with problems (e.g. Kretzmann, 1992). Learners work with constituents, developing relationships of trust. Issues of race, culture, and power are discussed as part of reflection upon field work (e.g. Jones et al., 2005; Pompa, 2005). Critical service learning strongly supports a community orientation to teaching.
Cultural immersion

In a study of 100 members of the National Association for Multicultural Education, cultural immersion was one of the key factors that influenced respondents’ commitment to multicultural education (Paccione, 2000). Cultural immersion experiences helped educators venture outside their cultural comfort zone and transformed their understanding of others.

For more than thirty years, cultural immersion projects at Indiana University-Bloomington (IU) have supplemented conventional student teaching, providing prospective teachers with cultural insights and developing community teacher knowledge (e.g. Stachowski & Mahan, 1998). The American Indian Reservation Project (AIRP) prepares and places student teachers for 17-week teaching assignments in schools across the Navajo Nation.

During the academic year prior to student teaching, pre-service teachers undergo extensive cultural education for their placement sites, including sessions with consultants from host groups. During student teaching, they live in Bureau of Indian Affairs dormitories, providing tutoring, companionship, and activities for Navajo youth. Participants teach and immerse themselves in the lives and cultures of the people with whom they work (Stachowski & Mahan, 1998). They perform at least one service learning project and submit reports in which they reflect on cultural values and issues.

Through immersion, pre-service teachers gain deep, cultural knowledge of their sites, recognize the worth of local wisdom, commit to service learning, and create culturally relevant curricula (Stachowski & Brantmeier, 2002; Stachowski & Frey, in press; Zeicher & Melnick, 1996). The idea of immersion suggests the need for long-term, local, interaction to gain cultural insights about one’s future students.

Community schools

Community schools are a definitive location for teachers prepared to serve community. Community schools are not a new idea. Fueled by the Charles Stewart Mott Foundation, a community education movement gained national visibility in the 1930s. In 1933, Frank Manley initiated “lighted schools” in Flint Michigan. Eventually, 50 school buildings offered after school and summer programs, health services, and community education programs (Dryfoos, 2002).

Beginning in the mid-1980s, community schools took root anew. Community schools built on the experience of lighted schools to in order to help contemporary young people succeed. In 1997, a group of educators and social service leaders formed the Coalition for Community Schools to support an array of school-based, community education endeavors (Dryfoos et al., 2005). The Coalition for Community Schools defines a community school as a “set of partnerships and a place where services, supports, and opportunities lead to improved student learning, stronger families, and healthier communities” (2000, p. 1). Over 1,000 schools are now in operation (Dryfoos, 2002).

While community schools are well underway, efforts to prepare teachers to work in them are almost non-existent. Thirty-five years ago, Leonard Covello suggested teachers for community schools should: “should get the major part of their training on the job” (Peebles, 1969, p. 19). Recently, Martin Blank, Staff Director for the Coalition for Community Schools, suggested the same thing (Martin Blank, personal communication, June 27, 2005). Teachers, he said, bring “personal conviction” to community schools and, then, “learn the rest on the job.”
We can find seeds of principles for community teacher preparation in words and deeds from earlier days. Leonard Covello wanted prospective teachers to “get off the college campus and rub elbows with the people they will later be dealing with” (Peebles, 1969, p. 17). He wanted them to understand youth and their families through personal involvement. “The child will have a different meaning to the teacher if the teacher has been directly involved in the child’s life in the child’s own community” (Peebles, p. 19).

As noted in our snapshot, Covello initiated comprehensive in-service programs for his faculty (McGee Banks, 2005). At BFHS, in-service training focused on learning about student’s cultural backgrounds, addressing family concerns, and participating in neighborhood affairs. Education was perceived broadly, as something that took place in and out of school. We daresay these aims retain legitimacy for community oriented teacher preparation today.

1 Schools of education should help urban teachers develop a system of accomplished practice, or professional and instructional activities that promote academic and personal development for diverse learners.
2 Accomplished practice should be articulated as a set of standards for urban schools with diverse student bodies.
3 Community teachers should participate in a rich array of field experiences, including immersion in collaborative, inquiry oriented contexts and in urban, community settings.
4 Any candidate can become a community teacher, given sufficient opportunity to learn accomplished practice and to gain cultural insights.
5 The development of community teachers requires assistance from a network of colleagues, including successful urban teachers, parents, and community members, rather than from a single mentor teacher.
6 The right context for teacher development is community-dedicated, practice-oriented, urban-focused field work.
7 Teacher education should be considered ecological, with intersecting, mutually reinforcing, levels of experience and expertise.

Murrell introduces the idea of accomplished practice to our discussion, as learning successful, teaching strategies for particular populations with whom teachers work.

PRINCIPLES: A PDS VIEW

The Holmes Group originated the term professional development school in their 1986 publication of Tomorrow’s Teachers. A PDS is expected to create a new kind of partnership between universities and P-12 schools. University faculty and P-12 teachers work together for joint aims as expectations and roles of each become more complex and intertwined than in traditional field placements (Book, 1996). The Holmes Group (1986) envisioned partnerships between universities and P-12 schools that provide opportunities for teachers and administrators to influence the development of their profession while, at the same time, university faculty have the opportunity to increase the relevance of their work. Collaboration occurs through mutual problem solving on issues related to student
learning, shared teaching at the university and schools, and cooperative, innovative supervision of teacher candidates.

The concept of PDSs was influenced by the medical profession’s teaching hospitals (Book, 1996; Koehnecke, 2001). In these settings, future physicians are placed in hospitals with licensed doctors, and their training is supported by interaction with medical researchers. The physician-trainee practices with real patients under the tutelage of a practicing doctor, gaining experience in actual, rather than simulated, medical situations and emergencies. In many ways, this approach mirrors Covello’s assertion that a major part of a prospective teacher’s training should be on the job.

This is not to say that collaboration and partnerships are new to teacher education. The need for novice teachers to gain experiences during their early preparation historically led to arrangements between colleges/universities and school districts. Staff development for licensed teachers also provided opportunities for higher education and school districts to work together. However, collaboration is fraught with potential problems and risks. Byrd and McIntyre (1999) suggest that one unanticipated outcome of the PDS movement may be better understanding of these obstacles and more incentive to collaborate in schools and universities.

Several groups developed principles to guide the development and implementation of PDSs. For example, in 1993 Frank Murray articulated features of effective PDSs. These include:

1. Understanding the content by all teachers is the goal of the school.
2. It is the intention to teach important knowledge and for students to master that even if it means that they have exposure to less information.
3. The goals of the school apply to all pupils, including those who are hard to teach.
4. Teachers use dialectical instruction, which is more responsive to the needs and understanding of the individual students.
5. Students are required to be active in their interaction with the knowledge because it is perceived their understanding is dependent on the context for knowledge.
6. Valid assessment is used to determine the students’ abilities to use the information gained in real-world contexts.
7. The learning community in a PDS models the values students are to acquire, including the demonstration of a negotiated, dialectical learning process.
8. The professional teacher is a continual learner who seeks to collaborate with others to respond to the learning needs of students.
9. The school organization is structured to allow teachers to have time for reflection, planning, and consultation necessary for a dialectical learning environment.
10. The goal is to bring integrated support services to the needs of the students.
11. The PDS is a center of inquiry that contributes to the scholarly literature and that works to solve practical problems related to teaching and learning.

According to these principles, teachers should master content, become students of teaching, collaborate with peers on inquiry, gain expertise in constructed learning, and use valid forms of assessment to determine what students learned.

From the Holmes Group, the Holmes Partnership evolved. This network of universities, schools, community agencies and national professional organizations work together to improve teaching and learning for all children by creating high quality professional development and by fostering significant school renewal. The Holmes Partnership (1996) put forth six goals to assist the development and assessment of quality PDS partnerships. These include:
• Goal 1: High Quality Professional Preparation—provide exemplary professional preparation and development programs for public school educators.
• Goal 2: Simultaneous Renewal—engage in simultaneous renewal of public K-12 schools and teacher education programs.
• Goal 3: Equity, Diversity, Cultural Competence—actively work on equity, diversity and cultural competence in K-12 schools, higher education, and the education profession.
• Goal 4: Scholarly Inquiry and Programs of Research—conduct and disseminate educational research and engage in scholarly activities that advance knowledge, improve teaching and learning for all youth, inform the preparation and development of educators, and influence educational policy and practice.
• Goal 5: School and University-Based Faculty Development—provide high quality doctoral programs for the future education professoriate and for advanced professional development of school-based educators.
• Goal 6: Policy Initiation—engage in policy development and analysis related to public schools and the preparation of educators.

These goals reiterate the importance of professionalizing teachers, through exemplary teacher preparation and professional development programs (based on the latest research). School renewal is centered on student learning, again based on research. A new aim is to affirm diversity and to develop cultural competence through teacher education and professional development.

In 2001, the National Council for the Accreditation of Teacher Education (NCATE) introduced standards to define and guide PDSs. NCATE defines a PDS as an environment that supports candidate and faculty development within the context of meeting all children’s needs. PDS partners must be guided by a common vision of teaching and learning grounded in research, share responsibility for teacher preparation, blend their expertise to meet common goals, hold themselves publicly accountable for meeting common goals, and commit themselves to prepare teacher candidates and faculty to meet the needs of diverse student populations.

So, what does teacher education mean in a PDS? PDSs should be places of professional excellence and inquiry where teacher candidates practice innovative techniques, under the tutelage of fine teachers and scholars, like the medical profession.

STICKING POINTS

PDSs seek to professionalize the teacher, developing a culture of academic expertise. Community oriented efforts downplay specialization, fearing that it distances teachers from communities. Instead, teachers are urged to blend school and community cultures. PDSs focus primarily on students’ academic achievement, while community schools take a broad view of student development as academic progress, personal well-being, cultural affirmation, and social engagement. PDSs emphasize linkages between schools and universities. Community oriented efforts stress connections between schools and communities. PDSs aim to be centers of educational excellence. Community oriented schools aim to be anchors of communities.

While PDSs call for attention to diversity, particularly in terms of student achievement, there is little indication that it is central to the movement. Alternatively, the affirmation of diversity is the “lingua franca” of community-dedicated initiatives. PDSs call for integrated services to support youth, but, again, there is little indication of its centrality.
Education of the whole child, meeting education, health, and social needs, is paramount for community initiatives.

PERSPECTIVES: A COMMUNITY ORIENTED VIEW

Leonard Covello (1958/1970) entitled his autobiography, *The Heart is the Teacher*. His heart literally beat with the pulse of his East Harlem neighborhood. His students’ issues were his issues, affecting him personally and professionally. Covello believed that the school should be a major force in community development. He utilized school resources to assist student growth, provide adult education, challenge ethnic denigration, and combat disruptive forces of urban poverty. Covello thought of himself as a teacher with heart. What modes of thought and action might ground community oriented teachers—teachers with heart?

Multicultural understanding

One of the problems Leonard Covello faced was a dearth of multicultural understanding among his faculty. The teachers were subject matter specialists who did not know how to address issues of culture and race in the classroom (McGee Banks, 2005). In his autobiography, Covello (1958/1970) recalled a time when an English teacher asked him to expel a boy who was troublesome in her class. The boy wanted to finish high school and asked for a second chance. The teacher was: “young, new to East Harlem, and could not wait to be reassigned to a school in a better neighborhood . . . She had been raised in Pelham, a peaceful suburb of New York, and this was her first regular job” (p. 200). Covello advised the teacher:

> It’s easier for me . . . because I was raised in the same way and have lived all my life in the same neighborhood . . . But, if you convince yourself deep down that these boys . . . are basically not much different from others you have known, and that they would like to be liked by you, then most of your troubles will be over.”

(Covello, 1958/1970, p. 200)

Not much has changed. Today, teachers rarely understand a community to which they do not belong as well as they think they do (Sleeter, 2000). They assume they know students well because they see them in school everyday. They think of multicultural education narrowly, as the addition of cultural information to lessons. Teacher education courses can begin to help teachers understand issues of culture, race, and power, but community knowledge can not be learned in college classrooms alone. Community teachers need to learn about their school communities by participating in them.

Ethic of service

An ethic of service is a “habit of the heart” (Bellah et al., 1985, p. 37), or a conviction that can ground community teaching. Several concepts can assist teacher’s development of a service ethic. They can imagine themselves as servant leaders (Greenleaf, 1977), or leaders who see themselves as servants first. Servant leaders are learners who respond to problems by listening and, then, by offering their resources to assist the aims of those they serve. As they genuinely serve others, their effort is recognized as local leadership.

Jane Addams, leader of Hull-House, a settlement house in Chicago in the early 1900s,
demonstrated servant leadership (Daynes & Longo, 2004). She started her career think-
ing that Hull-House would provide cultural uplift to immigrant families. But, as Addams spent time with her neighbors, she realized that families brought cultural traditions with them to their new country. She began to work collaboratively with her neighbors to develop educational, cultural, and political programs that served their needs.

Nel Noddings (1984) proposed another idea that can underpin a service ethos: an ethic of care. To care is to feel and act in empathy with the concerns and hopes of others. Of course, the crux of the matter is making connections with others, who may be different from oneself. Care with not for as a collaborative mood of mutual human-ness must be at the root of a community orientation toward teaching.

Community teachers need to think of teaching as public service and of themselves as public servants. Accountability should be redefined to mean a sense of responsibility for child, family, and community development. A sense of dedication to the greater good should underpin teachers’ work.

Asset-based view

From a needs-based perspective, distressed, city neighborhoods are overwhelmed with problems. They are places where helpless individuals and hapless organizations predominate. This view prevails among those who make policy and distribute resources. It is often taken up by the media, and, eventually, it sifts down to pre-service teachers (Boyle-Baise & Sleeter, 2000).

From an asset-based perspective, needs in neighborhoods, while very real, describe only part of a community’s reality. The other part is local strengths, wisdom, and resources. It is what people know and can do. It is its formal and informal organizations, its businesses, its buildings, and, especially, its schools (Kretzmann, 1992). Teachers are key assets; they are a pool of highly educated adults who contribute to efforts of local groups.

Community teachers need to perceive even the most devastated neighborhoods as places with internal strengths. They need to see themselves as people with skills and knowledge who can assist neighborhood improvement. They need to view school-community partnerships as promising avenues for community development and empowerment.

Broad, relational view of education

Jane Addams claimed that “the settlement is a protest against a restricted view of educa-
tion” (Addams, cited in Daynes & Longo, 2004). She perceived education broadly, relation-
ally, and publicly. Education was not distanced from a community, but instead drew from it. Education was not specialized, but something of public, universal interest.

Hull-House was a model of learning that took place outside the school and involved children and adults from diverse backgrounds. It offered a kindergarten, music school, drama training, citizenship classes, and general adult education. It served as a mediator between neighborhood residents and other institutions, including schools. The Hull-

Leonard Covello (Peebles, 1969) found it natural that teachers would think of educa-
tion as something that occurred in classrooms—they spent the better part of their lives there. He submitted that even practicing teachers saw only the four walls of the school not the community in which the school was located. He thought it was extremely important to get teacher candidates out of university classrooms and into community experiences as soon as possible.
Community teacher knowledge

Murrell envisions the “community teacher,” as someone who “possesses contextualized knowledge of the culture, community, and identity of the children and families he or she serves and draws on this knowledge to create the core teaching practices necessary for effectiveness in a diverse setting” (2001, p. 52). Community teacher knowledge is knowledge of the lives, cultural traditions, and experiences of students.

Community teacher knowledge is called by many names, including culturally relevant teaching (Ladson-Billings, 1994) and culturally responsive pedagogy (Gay, 2000). Characteristics include: validation of the cultural knowledge, prior experiences, and frames of reference of ethnically diverse students; attention to cultural responsiveness in curriculum content, classroom climate, and instructional techniques and assessments; commitment to student success, and promotion of student engagement as productive members of their ethnic groups and of the national society (Gay, 2000, pp. 29–34).

Murrell (2001) submits that most teacher candidates drawn to community oriented teaching will come from urban neighborhoods, like those served, but that any person can become a community teacher if he/she makes an effort to gain local knowledge. A community teacher needs to gain community teacher knowledge and to practice culturally responsive teaching.

PERSPECTIVES: A PDS VIEW

From a PDS perspective, teachers should be content experts, helping all students learn constructively, in interaction with knowledge. Teachers should be learners, continually striving, through inquiry, to comprehend and improve student learning. Teachers should be collaborators, working with university partners and school peers to reform schools (Murray, 1993; NCATE, 2001). Teachers should be accountable for what students learn. The following notions ground the preparation of teachers for PDSs.

Mastery of content knowledge

A call for enhanced teacher content knowledge helped propel the PDS movement (Teitel, 2003). Federal, Title II legislation, in the late 1990s, resulted in Teacher Report Cards, requiring teacher education programs to report the pass rates of teacher candidates on content exams. Title II Legislation also required arts and science faculty to become more involved in teacher education programs as in collaborations with schools. NCATE then required an 80 percent pass rate on content-area exams for completers of teacher education programs.

Obviously teachers must be competent in their content knowledge to effectively and efficiently present this subject matter to students. This point grounds the No Child Left Behind Act’s (2002) definition of a “highly qualified teacher” as a person who passes a test of content knowledge. This definition assumes that subject matter, which can be assessed on a standardized test, is what teachers need to know to teach well (Cochran-Smith, 2004). Teacher education programs have responded to this political pressure with renewed emphasis on the acquisition of subject matter knowledge. However, Wise (2005) argues that this restricted definition of a “highly qualified teacher” does not emanate from the teaching profession’s values and beliefs.

Those in the PDS movement argue that, although knowledge of subject matter is essential, it must be linked to practice in classrooms that meets the needs of all students.
This aim is accomplished by having courses taught in the schools, by collaborating with practicing teachers as well as with arts and science faculty, and by increasing the time teacher candidates spend in classrooms observing, tutoring, and teaching students. PDSs aim to increase teacher candidates’ subject matter knowledge as well as their understanding of the school and student culture. However, a question remains. Does a strong emphasis on subject matter knowledge interfere with the teacher candidates’ understanding of student and community needs?

Learning through inquiry

The Holmes Partnership (1996) established scholarly inquiry as one of its primary goals for effective PDSs. This Partnership urges PDSs to conduct and disseminate educational research in order to advance knowledge, improve teaching and learning for all youth, inform teacher preparation and professional development, and influence educational policy.

The emphasis on research is no surprise given PDSs’ comparison to teaching hospitals where future doctors learn on-site and where researchers conduct studies to advance knowledge and skills within their profession. Similarly, inquiry has been implemented in PDSs through several avenues. First, teacher education scholars have begun to conduct research on teacher development, supervisory and collaborative practices, and student achievement. Second, inquiry within PDSs focuses on action research conducted by teacher candidates, practicing teachers, and university faculty on site. Dana et al., (2001) argue that inquiry must be a central feature of a PDS. Teitel (2003) claims that the conduct of inquiry in PDSs helps ensure that new practices, strategies and/or policies actually lead to improved learning of students and adults. Although much can be learned from conducting action research projects in PDSs, there is still much to learn about the actual process of inquiry and how it contributes to teacher development (Crocco et al., 2003; Price & Valli, 2005).

Collaboration/partnership

Teitel (2003) asserts that the words “collaboration” and “partnership” are two of the most overused and misused words in the late twentieth and early twenty-first centuries. Yet, authentic collaboration and partnership between institutions of higher education and P-12 schools are at the core of the PDS concept. As Teitel (2003) reminds us, however, some schools call themselves PDSs simply because a university places student teachers in their building with no other substantive changes in program, philosophy, or policy. So, whereas the school may be “cooperating” with the university, there is little, if any, “collaboration” that can result in transformative change at the school or university level. Teitel (2003) describes collaboration as “complex interpersonal and inter-organizational undertakings” (p. 10).

PDS advocates believe that schooling and teacher education are intertwined and that transformative change of either endeavor cannot occur without collaboration between the two partners. Valli (1999) states that the existence of collaborative partnerships represents a sea of change in the way higher education and school systems have typically related in the past. She reminds us that school-university partnerships must transform the cultures of both contexts to become more than individualized initiatives by committed educators.
Accountability for student learning

Dedication to P-12 student needs is a cornerstone of the PDS movement. In an era of accountability, however, this focus has narrowed to concern with student academic achievement. Few educators question the right of the public to hold teachers accountable for student learning and to expect higher education institutions to take some responsibility for this aim. Unfortunately, as Cochran-Smith (2003) argues, this charge for accountability has often been interpreted solely as higher scores on standardized achievement tests.

The emphasis on improving student achievement is linked commonly to the PDS goal of promoting equity in the classroom, especially of decreasing the achievement gap between students of different race and class backgrounds. Teitel (2003) cites an example of the Boston public school system providing over a quarter of a million dollars annually to fund local PDS interns. He pressed for evidence that PDS preparation made the interns more effective in reducing the achievement gap among Boston students. However, as noted later in this chapter, PDSs have been criticized for focusing so much on academic achievement that they have not lived up to their promise to promote equity in schools. It is interesting to note O’Sullivan’s (2005) description of her interviews with potential teacher candidates:

For many years, I have been interviewing candidates who hope to come into our teacher education program. One of the questions we always ask is, “Why do you want to be a teacher?” The answers to this question are remarkably similar across time, major, race, and gender, nearly all candidates answer this question with the same version of “I think I can make a difference here.” When pressed to clarify what “make a difference” means, I have yet to have a candidate dream of raising the end-of-the-year achievement scores for children. What candidates do mention when trying to articulate making a difference is a vision of helping children become better people, of helping them become more competent and more caring.

(O’Sullivan, 2005, p. 3)

O’Sullivan’s statement reminds those of us involved in PDS work that while focusing on improved student achievement and decreased achievement gaps between different races and class backgrounds is a worthy goal, it should not be our sole focus for equity.

STICKING POINTS

Teacher candidates who participate in PDS or in community oriented initiatives are encouraged to develop very different mindsets. Imagine their confusion when they undertake service learning in one part of their program and end up student teaching in a PDS! In community oriented activities, pre-service teachers are urged to gain cultural knowledge and cross-cultural experiences. In PDSs, pre-service teachers are urged to become subject matter specialists, possibly at the cost of learning about diversity.

Where community oriented teachers are invited to consider themselves as public servants, PDS teachers are encouraged to think of themselves as professionals. One perspective can bring teachers closer to those they serve; the other can distance them from constituents. For a community emphasis, teachers are asked to think of education broadly, but for a PDS focus, teachers are expected to concentrate on what happens inside schools.
Both contexts support an inquiry stance for teachers, but, the focus of research differs. In PDs, inquiry should aim to decrease achievement test gaps. In community engagements, inquiry should aim to learn more about students as whole human beings. Inquiry, as a potential intersection between contexts, is discussed later in the chapter.

**PRACTICES: A COMMUNITY ORIENTED VIEW**

How can teacher candidates deepen their multicultural understandings, practice an ethic of service, grasp education broadly, identify local assets, and gain community wisdom? A body of evidence is growing in regard to these questions, and we share it here. We organize these findings by topics of our discussion, but they are overlapping and interdependent.

**Gaining community teacher knowledge**

Prospective teachers can learn through service to local communities, especially when service is collaborative in nature and augmented by course work. Seidl (Seidl et al., in press) arranged an internship for pre-service teachers at an African American Baptist church. Pre-service teachers worked with adults in programs created for children from the community, such as tutoring or latchkey programs. Their field experience was supported by course work focused on racism, privilege, and African American culture, and by reflection guided by university instructors and by church members. Prospective teachers considered themes that arose from their work with church youth. Through this process, prospective teachers identified specific information that could help them teach in culturally responsive ways.

Kidd et al. (2003) contribute findings that support Seidl’s work. As part of a class in early childhood education, pre-service teachers developed a relationship with a family whose cultural was different from their own. Their listened to family stories and used the information to plan learning experiences responsive to the family’s needs. Most pre-service teachers met with their selected families three or four times, often in their homes. Pre-service teachers reported that they: understood a culture different from their own, felt able to work with their focus family, and felt able to transfer their learning to work with other families.

Another way to link pre-service teachers to local wisdom is to involve people intimately acquainted with localities in a community of practice as co-teacher educators (Murrell, 2001). A community of practice is marked by mutual engagement, joint enterprise, and shared repertoire (Wenger, 1998). The most common, teacher preparation collaboration is the clinical triad which counsels student teachers. Murrell (2001) suggests opening the triad to a range of advisors for teachers’ practice. Parents, university faculty, teachers, and community leaders could serve as a community of practice for student teachers.

One of us witnessed the power of community people as educators for prospective teachers. Lynne worked with a community partnership to co-teach a service learning component for a multicultural education course (Boyle-Baise et al., 2001). Her partners represented a variety of positions and roles: from church leaders to Head Start staff, to community center directors. They helped plan, implement, and evaluate service learning. Their input greatly diversified the knowledge pre-service teachers gained.
Identifying local assets

Teachers can gain community teacher knowledge and identify local assets through the study of community-as-text (Blank et al., 2003). This approach uses the history, culture, and conditions of the community as content for learning. Pre-service teachers’ role is that of a facilitator, co-learner, and link to community resources for students. Place-based education is another derivation of this focus. Students “go local” (Smith, 2002, p. 30) to learn more about the historical issues, cultural traditions, environmental issues, and civic processes in their home space.

Several projects illustrate ways in which studies of community-as-text reveal local assets. Under the auspices of the West Philadelphia Improvement Corps college history majors, high school students, and former neighborhood residents teamed up to study the history of a community displaced by urban renewal. College and high school students gained a wealth of knowledge from local residents, resulting in “Black Bottom Sketches,” plays about the community in earlier days (Coalition for Community Schools, 2000, p. 9).

For the Banneker History Project (Boyle-Baise, 2005), pre-service teachers helped high school students reconstruct the history of a once segregated school in their town. Under pre-service teacher’s guidance, high school students interviewed surviving alumni of the school. They tapped into funds of wisdom (Moll et al., 1992) in the form of personal stories about school segregation. Prospective teachers identified elders of color as significant sources of knowledge about past and present racism. They started to wonder about ways that local residents might serve as resources for historic studies of their home towns.

Practicing an ethic of service

Educators have utilized service learning to help prospective teachers (and other service providers): question assumptions, confront racism, consider cultural difference, and begin to think about positively about serving in pluralistic contexts (e.g. Rosner-Salazar, 2003; Wade, 2000). However, much depends on the rationale for and type of service learning. As Morton (1995) notes, a mismatch of course goals and service work can stymie course aims. For example, a charitable experience does not prod critical, social insights (e.g. Cipolle, 2004). Further, unless a service ethic is incorporated through out teacher education programs; pre-service teachers can see service learning as something peripheral to teacher preparation (e.g. Boyle-Baise, 2005).

When service is considered integral to teacher education, as in the AIRP, pre-service teachers can gain cultural insights and cultivate an ethic of service. In Navajo communities, pre-service teachers believed that their service efforts boosted their acceptance, as local residents recognized their willingness to work and learn. Pre-service teachers began to see themselves as community members and to look for ways to continue to serve. They started to rethink their roles as educators to include both teaching and community service (Stachowski & Frey, in press).

Participating in cultural immersion

Cultural immersion is an experience with multiple benefits for a community orientation to teaching. It can foster deep learning about another culture, assist the identification of local resources, and prompt commitment to service learning. In studies of the AIRP, Mahan and Stachowski (1993–1994) found that student teachers identified community people, such as American Indian dorm staff and parents of students as important sources...
for their learning. Their service learning projects fostered greater community teacher knowledge and more commitment to making service part of the curriculum. Further, Stachowski (1997) found that 26 percent of student teachers used their local awareness to create culturally relevant teaching units.

Even short-term immersion projects seem to help develop dispositions, knowledge, and skills needed to become a community teacher. Amazingly, Wiest (1998) found that when students spent at least one hour, alone, participating fully in a cultural context quite foreign to them they: dispelled stereotypes, grasped different cultural frames of reference, and increased their ability to take perspectives of others.

Ference and Bell (2004) found that pre-service teachers deepened their understanding of Latino, Spanish-speaking youth in just two weeks of field experience. Their work compares with AIRP, suggesting components for effective cultural immersion: intensive cultural education prior to field work, lived experiences with host families, involvement in community activities, and regular reflection on issues of culture, race, and power.

PRACTICES: A PDS VIEW

Does the PDS model hold promise for transforming the learning community in schools? Can teachers learn to be masters of content knowledge, investigators of learning, collaborative educational partners, and experts in student achievement? We explore bodies of research in response to these questions. Findings should be considered overlapping and interdependent.

Mastering content

We did not find much evidence that focused expressly on teacher’s content knowledge, although a firm grasp of subject matter is key to the PDS movement. Instead, teacher knowledge is defined as pedagogical content knowledge.

Paese (2003) examined two groups of teacher candidates who had different types of PDS experiences. The first had two PDS experiences prior to student teaching and a PDS student teacher experience. The other group had two PDS experiences prior to student teaching, but had a traditional, non-PDS student teaching experiences. At the conclusion of student teaching there were significant differences in favor of the Total PDS group in areas of role preparedness, personal teacher efficacy and general teacher efficacy. Ridley et al. (2005) conducted a two-year study that compared the lesson planning, teaching effectiveness, post-lesson reflectivity and content retention of professional teaching knowledge for candidates at a PDS or a campus-based program. Scores of PDS-prepared student teachers were consistently higher than their campus-prepared peers, but no statistically significant differences were discovered. However, during the first year of teaching, PDS-prepared teachers scored significantly higher than campus-prepared teachers on: managing student behavior, maintaining students’ interest during instruction, and providing immediate feedback. This finding is supported by previous studies conducted by Houston et al. (1999); Sharpe et al. (1999); Stallings (1991) and Wait (2000).
Acting as inquirers

Although inquiry is a cornerstone of the PDS movement, there is very little research that looks at its effectiveness. Galassi et al. (1999) reported on a PDS project that focused on collaborative inquiry as a vehicle for developing teachers and for enhancing student achievement at a middle school. Inquiry groups focused on looping, working with book groups, and resiliency of students. Anecdotal evidence suggests that the inquiry group activities had an empowering effect on teachers and that teaching practices were refined.

Rock and Levin (2002) conducted a study that examined the effect of collaborative action research on teacher candidates. Data were obtained from five teacher candidates, each of whom worked with an on-site teacher educator mentor. Engagement in action research provided teacher candidates with an opportunity to explore images of themselves as teachers, to wrestle with novice concerns of teaching, to interact with and study students in systematic ways, to gain valuable insights into the curriculum and their roles and responsibilities, and to realize the importance of focused inquiry for their professional development.

Participating in collaboration

McBee and Moss (2002) reported on the efforts of a PDS to address teacher and student needs at a time when inclusion began to increase in a large, urban, P-8 school. Workshops on collaborative learning and teaching as well as developing caring communities were offered to teacher candidates and experienced teachers. Test performance of special education students in the inclusion classrooms improved despite reading skills that were well below grade level.

Fisher et al. (2004) reported that students in classrooms with student teachers in a PDS had significantly higher achievement gains than those students who were in classrooms taught by classroom teachers alone. The presence of the student teacher allowed for more small group instruction and for more co-teaching, improving achievement.

Fischetti et al. (2000) examined the benefits of a yearlong experience for teacher candidates in a high school PDS. Interviews revealed that the candidates felt more comfortable with their classroom and more knowledgeable about their teacher’s planning and responsibilities, and that they developed more meaningful relationships with their cooperating teachers. They felt at ease in talking with teachers about instructional issues.

Fostering student achievement

Student achievement is the sin qua non of PDSs, without proof of student learning there is little reason to promote the PDS model. We culled through the research, looking for varied foci on student learning and for strength of findings. We report a sample of the research here.

Houston et al. (1999) described a consortium of four universities and three school districts designed to prepare teachers for urban settings. They reported that, over a three-year period, student achievement in reading, mathematics and writing on the Texas Assessment of Academic Skills (TAAS) increased in PDS schools as opposed to non-PDS schools. Also, a greater proportion of PDS students passed the ExCET tests than their peers in the traditional programs. PDS students were significantly more on-task than their non-PDS peers. In addition, PDS students were more likely to be placed in small group instruction and less frequently placed in whole group activities than were students in the non-PDS classes.
Klingner et al. (2004) examined the possibility of enhancing the achievement of special education students in an urban PDS. Students’ standardized test scores increased over an eight-year period and were higher than the scores of students in non-PDS schools. Interviews with teachers and administrators revealed that they perceived students benefited in academic, social/affective and general domains.

Several studies found pre-service teachers focused on classroom management as their key concern. We group them here to indicate the centrality of this concern.

Neubert and Binko (1998) studied the effectiveness of a PDS in Maryland. Their study consisted of two groups of teacher candidates. One group consisted of 11 teacher candidates who enrolled in a discipline-specific methods class and a three-credit internship at a PDS. The second group of ten candidates also was enrolled in the same discipline methods class but elected not to do the internship in the PDS. Data showed that PDS teacher candidates performed “at a competent level” while non-PDS candidates performed at a “minimally satisfactory” level. Researchers concluded that the PDS experience was more effective in preparing the teacher candidates to maintain classroom discipline, use technology effectively for instruction, and reflect upon their own teaching.

Conaway and Mitchell (2004) studied the impact of a year-long internship on 22 interns in a PDS setting. Interview questions focused instructional responsibilities and decision-making, behavior management, interactions with mentor teachers, university supervisor support, and content of seminars. PDS interns consistently reported an emphasis on “positive management techniques.” PDS interns reported more responsibility for making and implementing instructional decisions than one-semester student teachers.

McIntyre et al. (2006) examined the impact of a yearlong, induction, field-based master’s degree program for recently certified teachers: Teaching Fellows. Teaching Fellows believed that they were better prepared for the classroom than their non-PDS peers in the areas of classroom management and the ability to meet the needs of their students.

A similar study was conducted by Giles et al. (2001). Teaching Fellows answered questions about their greatest satisfaction in teaching and about their greatest concerns. Professional survival and classroom management were the top categories cited by the Teaching Fellows. Most of the Fellows were focused on their desire to manage the classroom better so that more learning could take place.

Summary

In each of these cases, the programs delivered through the PDSs resulted in improved preparation of teacher candidates when compared to the non-PDS programs. While we found few studies on teachers’ content knowledge, or on their abilities to investigate student learning, many studies indicate that PDSs improve teachers’ capacities to foster student achievement, and some show teachers are more able to collaborate with peers.

STICKING POINTS

Our comparisons continue to suggest an inside/outside emphasis. From a community view, future teachers need to make connections outside schools, in communities. From a PDS view, future teachers need to concentrate on what happens inside schools, on student learning.

We get the sense that PDS practices are not transformative, instead prospective teachers instruct students effectively in conventional settings. PDS teachers are concerned with time on task, maintenance of interest, prompt feedback, and, above all, successful
classroom management. Extended time in student teaching, more than anything, seems to increase effectiveness on these factors. More local, cultural, social knowledge of students and their families and communities should heighten teacher effectiveness. Students seem to be faceless in PDS research.

Several scholars have criticized PDS practice, and we include those criticisms here. Peter Murrell (1998, 2001) claims that the PDS structure is culturally and politically neutral. He believes that PDS must challenge the status quo in urban communities. He thinks that PDSs exclude key partners, like parents and community activists, who could help transform the school and the local community.

Abdal-Haqq (1998) argues that PDSs attend to the establishment of relationships between schools and universities and to the transformation of roles for teachers and university faculty at the expense of attention to issues of equity. He wants PDSs to increase diversity in the teaching force and prepare teachers to work in communities with diverse student bodies. Teitel’s (1998), review of PDS literature revealed little evidence of progress toward meeting goals of equity. Valli et al. (1997) share similar findings in their review of the literature.

A COMMUNITY-ORIENTED PDS: BRIDGING TWO WORLDS

Our comparison points out ideological and pedagogical barriers to easy connections between these two worlds. Yet, the struggle has merit. We return to our sticking points, considering possible connections. Then, we propose principles, perspectives, and practices for teacher education in a community-oriented PDS.

Intersections

Reasonably, teacher education should develop professional behavior, but what counts as professionalism might be redefined. A professional might be perceived not only as a subject matter specialist, but as one who takes special care to learn about the home places from which students come. A focus on teacher practice within the school community can be broadened to include teacher understanding of the school’s community.

PDS and community-oriented teacher education stress collaboration, but with different groups. While complicated, it is possible to develop partnerships among universities, schools, and communities. Service learning illustrates a moment of such partnership. Pre-service teachers might engage in service learning and, then, try it out with youth. The student teaching triad offers another space to substantially involve community people in new teacher development. Service by teachers, parents, and local leaders on policymaking school committees suggests yet another avenue for partnership. Teacher candidates might observe and/or participate in committee work.

PDS and community-oriented teacher education are vitally interested in school renewal, particularly in improved student learning. Both urge prospective teachers to reach out to youth, helping them learn constructively. Both aim to address diverse constituencies, though the PDS response is tepid at best. Culturally responsive teaching, grounded in community teacher knowledge, arguably is integral to constructive learning. Prospective teachers might participate in cultural immersion and service projects, as well as rehearse interactive teaching strategies.

PDS and community-oriented education emphasize inquiry. Years ago, teachers in Covello’s community school conducted surveys to learn more about their students’ interests, backgrounds, and concerns. Action research is a centerpiece of PDSs, but the
topics seem to conceive of instruction narrowly, as something that happens inside school walls. Research also can be seen as a service project, helping local entities address concerns or improve programs. Further, research can focus on local history, telling forgotten stories that deserve attention. Prospective teachers might use action research to investigate a local problem, or uncover lost history, and, in so doing, learn about local assets and affairs.

New visions

In light of the insights gleaned from our comparisons and analyses, we propose the following framework for community-oriented PDSs.

**Professional:** what counts as professional dispositions, skills, and actions?

- *Teachers with heart:* teachers need to connect with students as members of families and communities. Teachers need to regard school communities as their communities. Local issues should become their issues. Teaching should be personal; teachers should care that students succeed.
- *Teachers with connections:* teachers should do more than go to school, then go home. They might coach volleyball or guide a school club. They might participate on school and neighborhood committees with peers and community people to address issues related to the school. Teachers should also connect with universities, engaging in lifelong learning.
- *Teachers with knowledge:* teachers should seek community teacher knowledge as well as subject matter expertise. Local issues should shape curriculum, involving students deeply in constructive learning.

**Development:** what might it mean in its broadest sense?

- *Student Development:* student development should remain at the core of the educational enterprise. Student development should include academic achievement, cultural awareness and ethnic identification, and health and general well-being.
- *Community development:* citizens pay for schools, gaining rights and responsibilities related to them. Citizens should be able to use “their” buildings for adult education and community meetings. Citizens also should shoulder some responsibility to assist schools, taking part in the education of “their” children. Schools should serve as an anchor for community, and, possibly, act as an advocate in regard to local concerns.
- *Teacher development:* future teachers should learn from a synergy of university-related and community-oriented activities. They should learn to teach innovatively, but also particularly, experimenting with teaching specific populations of students well. They need to gain wisdom of practice from accomplished teachers, especially for high poverty, rural and urban youth.

**School:** whose school is it anyway?

- *School renewal:* some old ideas deserve new life. The history of lighted schools and community schools like Benjamin Franklin High School should light the way for community-oriented PDSs. A community focus needs to be perceived as supportive of student learning.
- *School partnership:* links should be made between schools and universities. Connections need to be made with community organizations too. Service learning projects
offer a wonderful means to give and receive from neighborhoods, but parents, elders, and local leaders should serve on integral, significant school positions as well. Community participation in the student teaching “triad” seems like an excellent place to begin.

Where are different groups of teachers being educated, by whom, and toward what ends? What do we know about the impact of different settings and educators on teachers’ knowledge and practice, on students’ learning and on school change? We have explored two very different contexts for teacher education, probing their differences, and suggesting their intersections. We conclude that PDSs offer crucial teacher preparation, focused on student learning and grounded in teacher inquiry. However, attention to equity, diversity, family, and community needs to become an integral aspect of PDS principles, perspectives, and practices. It is vital to think of students as members of certain contexts, with particular educational needs. We propose a community-oriented vision for PDSs. We invite your further consideration of these issues.

3.1 The case for university-based teacher education

Linda Darling-Hammond

For a number of years, public dissatisfaction with schools has been coupled with dissatisfaction with schools of education as well. Education schools have been variously criticized as ineffective in preparing teachers for their work, unresponsive to new demands, remote from practice, and barriers to the recruitment of bright college students into teaching. In more than 40 states policy makers have enacted alternate routes to teacher certification to create pathways into teaching other than those provided by traditional 4-year undergraduate teacher education programs. Upon his election in 1988, President Bush’s only education proposal was the encouragement of alternative teacher certification to allow more flexible teacher recruitment. In 1995, Newt Gingrich proposed the elimination of teacher certification rules, which require preparation for teaching, as his major education initiative.

Voices of dissatisfaction have been raised from within the profession as well. During the past decade, significant critiques of traditional teacher education practices have been raised by the Holmes Group of education deans (Holmes Group, 1986) and the Carnegie Task Force on Teaching as a Profession (1986), along with scholars like John Goodlad (1990), Ken Howey and Nancy Zimpher (1989), and Ken Zeichner (1993), among others. These voices, however, have urged the redesign of teacher education to strengthen its knowledge base, its connections to both practice and theory, and its capacity to support the development of powerful teaching.

Proposals at the far ends of this continuum stand in stark contrast to one another: on the one hand, university-based preparation would be replaced by “on-the-job” training that focuses on the pragmatics of teaching, while on the other, more extensive professional training would aim to prepare teachers for much more adaptive, knowledge-based practice while tackling the redesign of schools and teacher education in tandem. Which of these routes holds the most promise? What would the implications be for teachers’ knowledge, skills, and commitments and, most important, for the education of children?

While the debates on these questions have been largely ideological, there is a growing body of empirical evidence about the outcomes of different approaches to teacher education and recruitment, ranging from quick alternative routes into the classroom to traditional university-based approaches to newer models that are 5-year extended programs or 5th year postbaccalaureate programs. As I describe in this chapter, the evidence strongly suggests that “on-the-job” pre-service training leaves teachers seriously underprepared. Most alternative routes sponsored by school districts, states, and other vendors have been found to be significantly less effective at preparing and retaining recruits than university-based teacher education programs. Furthermore, these truncated programs tend to feature regressive approaches to teaching practice that are seriously out of synch with new standards for student learning.

Although traditional teacher education programs differ significantly from one another and some have major shortcomings, as a group they produce teachers who are more highly rated and effective with children than are teachers who enter teaching without training or through quick
alternate routes. Furthermore, more extensive redesigned programs that have resulted from
recent reforms are even more successful than traditional four-year models. In short, teacher
education matters, and more teacher education is better than less. In what follows, I discuss why.

WHAT TEACHERS NEED TO KNOW AND BE ABLE TO DO

Central to any discussion of teacher preparation is a judgment about what it is teachers must be
prepared to do. If teachers are viewed primarily as purveyors of information for students, one
could argue that they need little more than basic content knowledge and the ability to string
一起 comprehensible lectures in order to do an adequate job. For this kind of teaching, it is
easy to believe that a liberal arts education could be sufficient preparation. But if teachers need to
be able to ensure successful learning for students who learn in different ways and encounter a
variety of difficulties, then teachers need to be diagnosticians and planners who know a great deal
about the learning process and have a repertoire of tools at their disposal. This kind of teaching is
not intuitively obvious. And it is this kind of teaching that current social demands increasingly
require.

In today’s complex society and economy, much greater numbers of students need to be pre-
pared for much more challenging forms of learning than ever before in our history. In order
to meet the ambitious standards for student learning currently being developed by states and
professional associations, teachers must learn to teach for understanding and to teach for
diversity—that is, to teach in ways that enable a wide range of learners to succeed at very
demanding intellectual tasks (National Commission on Teaching and America’s Future, 1996).

What do teachers need to know to teach all students in the way new standards suggest? First
of all, teachers need to understand subject matter in ways that allow them to organize it so that
students can create useful cognitive maps of the terrain. They need more than formulaic or pro-
cedural understanding of the core ideas in a discipline and how these help to structure know-
ledge, how they relate to one another, and how they can be tested, evaluated, and extended.
Teachers also need to be able to use their knowledge of subject matter flexibly to address ideas
as they come up in the course of learning. They need to understand how inquiry in a field is
conducted and what reasoning entails—such as what counts as “proving” something in math-
ematics as compared with proving something in history (Ball & Cohen, in press). And they need
to see ways that ideas connect across fields, and to everyday life, so that they can select and use
examples, problems, and applications well.

Understanding subject matter in this way provides a foundation for pedagogical content know-
ledge (Shulman, 1987), which enables teachers to represent ideas so that they are accessible to
others. Knowledge of the domain of study is critical: the teacher needs to understand what ideas
can provide important foundations for other ideas and how they can be usefully linked and
assembled. The audience is also key: people will understand ideas differently depending on their
prior experiences and context. A skillful pedagogue figures out what a particular audience is likely
to know and believe about the topic under study, and how learners are likely to “hook into” new
ideas, so as to create productive learning experiences. Knowledge of cognition, information pro-
cessing, and communication are also important so that teachers can shape lectures, materials,
learning centers, projects, and discussions in useful ways.

Interpreting learners’ statements and actions and framing productive experiences for them
requires knowledge of development—how children and adolescents think and behave, what
they are trying to accomplish, what they find interesting, what they already know and what
they are likely to have trouble with in particular domains at particular ages in particular contexts.
This knowledge includes an understanding of how to support further growth in a number of
domains—social, physical, and emotional, as well as cognitive.
Teaching in ways that connect with students also requires an understanding of differences that may arise from culture, language, family, community, gender, prior schooling, or other factors that shape people’s experiences, as well as differences that may arise from developed intelligence, preferred approaches to learning, or specific learning difficulties. Teachers need to be able to inquire sensitively and productively into children’s experiences and their understandings of subject matter so that they can interpret curriculum through their students’ eyes and shape lessons to connect with what students know and how they learn well. To get non-stereotypic information that can help them come to understand their learners, teachers need to know how to listen carefully to students and look at their work as well as to structure situations in which students write and talk about their experiences and what they understand. This builds a foundation of pedagogical learner knowledge (Grimmett & MacKinnon, 1992) which grows as teachers examine how particular learners think and reason, where they have problems, how they learn best, and what motivates them.

An understanding of motivation is critical in teaching for understanding, because achieving understanding is difficult. Teachers must know how to structure tasks and feedback so as to encourage extensive effort without either relinquishing the press for understanding when the going gets tough or discouraging students so that they give up altogether. Motivating students not only requires understanding general principles about how to engage young people and sustain their interest at different ages, but also understanding what individual students believe about themselves and their abilities, what they care about, and what tasks are likely to give them enough success to encourage them to continue to work hard to learn.

Teachers need several kinds of knowledge about learning. Since there are many kinds of learning—for example, learning for recognition or appreciation vs. learning for various kinds of applications or performances—teachers need to think about what it means to learn different kinds of material for different purposes, how to support different kinds of learning with distinctive teaching strategies, and how to make judgments about which kinds of learning are most necessary in different contexts. Not everything can be learned deeply—that is, with opportunities for extensive application—but some things must be deeply understood as foundations for work that is to follow and as a means for developing specific skills and performances. Other ideas may be understood more superficially to create a map of the domain, but learned so that they connect to concepts that are meaningful.

Teachers need to understand what helps children (or anyone) learn in these different ways. They need to be able to construct and use a variety of means for assessing students’ knowledge, as well as for evaluating student’s approaches to learning. To be effective, they must be able to identify the strengths of different learners while addressing their weaknesses—those who rely more on visual or oral cues; those who tend to reason from the specific to the general or vice-versa; those who use spatial or graphic organizers vs. those who are more text-oriented; those who bring a highly developed logical/mathematical intelligence and those who bring a strong aesthetic sense.

Using this information well requires a command of teaching strategies that address a variety of ways to learn and a variety of purposefully selected goals for learning. Strategies that regularly use multiple pathways to content are one major part of a teacher’s repertoire. In addition, more than ever before in the past, all teachers need tools to work with the students in their classrooms who have specific learning disabilities or needs—the estimated 15 to 20 percent of students who are dyslexic or dysgraphic, who have particular visual or perceptual difficulties or difficulties with information processing. There are useful teaching strategies for these relatively commonplace problems, but they have been rarely taught to “regular” education teachers. And, because language is the gateway to learning, teachers need an understanding of how students acquire language, both native English speakers and students who start from other languages, so that they can build language skills and create learning experiences that are accessible. This may
mean strategies ranging from explicit teaching of key vocabulary or use of an array of visual and oral cues and materials to the creation of collaborative learning settings in which students use language extensively.

Teachers need to know about curriculum resources and technologies. They need to be able to connect their students with sources of information and knowledge that extend beyond textbooks that allow for the exploration of ideas, the acquisition and synthesis of information, and the development of models, writings, designs, and other work products. The teacher’s role will be to help students learn to find and use a wide array of resources for framing and solving problems, rather than to remember only the information contained in one source.

And they need to know about collaboration. They need to understand how interactions among students can be structured to allow more powerful shared learning to occur. They need to be able to shape classrooms that sponsor productive discourse that presses for disciplined reasoning on the part of students. They need to understand how to collaborate with other teachers to plan, assess, and improve learning within and across the school, as well as how to work with parents to learn more about their students and to shape supportive experiences at school and home.

Finally, teachers need to be able to analyze and reflect on their practice, to assess the effects of their teaching and to refine and improve their instruction. When teaching for understanding, teachers must maintain two intertwining strands of thought at all times. How am I doing at moving the students toward high levels of understanding and proficient performance and how am I taking into account what students know and care about in the process of moving them toward these curriculum goals and developing their talents and social abilities? Teachers must continuously evaluate what students are thinking and understanding and reshape their plans to take account of what they’ve discovered as they build curriculum to meet their goals.

These demands that derive from the desire to teach a much wider range of students for much higher standards of performance are new ones for most teachers. With few having experienced this kind of learning themselves, how can it be possible to create a different kind of teaching on a wide scale? The only plausible answer is to develop much more powerful forms of teacher education—both before entry and throughout the teaching career—that systematically provide experience with the kinds of knowledge and forms of practice described above, and then to make that kind of education available to all teachers, not just a few. As Gary Fenstermacher (1992) observes:

In a time when so many advocate for restructured schools, for greater decision autonomy for teachers, and for connecting the schools more intimately with homes and communities, it is more important than ever that teachers have the capacity to appraise their actions, evaluate their work, anticipate and control consequences, incorporate new theory and research into practice, and possess the skills and understanding needed to explain their work to other teachers, and to students and their parents . . .

These reflective capacities are not innate to human beings, nor are they acquired quickly. They are not acquired during a planning period sandwiched somewhere in between classes, or during evening “mini-courses” after a full day’s work. They are, rather, the outcome of sustained and rigorous study, and of dialogue and exchange with master teacher educators. (35, in manuscript)

Developing the kinds of knowledge I have described requires that most teachers move far beyond what they themselves experienced as students, and thus that they learn in ways that are more powerful than simply reading and talking about new pedagogical ideas (Ball & Cohen, in press). Learning to practice in substantially different ways than one has oneself experienced can occur neither through theoretical imaginings alone, nor on unguided experience alone. It requires a much tighter coupling of the two.
Teachers learn just as students do: by studying, doing, and reflecting; by collaborating with other teachers; by looking closely at students and their work; and by sharing what they see. This kind of learning cannot occur either in college classrooms divorced from engagement in practice or in school classrooms divorced from knowledge about how to interpret practice. Good settings for teacher learning—in both colleges of education and schools—provide lots of opportunities for research and inquiry, for trying and testing, for talking about and evaluating the results of learning and teaching. The "rub between theory and practice" (Miller & Silvernail, 1994) occurs most productively when questions arise in the context of real students and real work-in-progress where research and disciplined inquiry are also at hand.

DO EDUCATION SCHOOLS HELP TEACHERS LEARN?

Even if one agrees that there are desirable knowledge and skills for teaching, many people sincerely believe that anyone can teach, or, at least, that knowing a subject is enough to allow one to teach it well. Others believe that teaching is best learned, to the extent it can be learned at all, by trial-and-error on the job. The evidence strongly suggests otherwise. Reviews of research over the past 30 years summarizing hundreds of studies have concluded that, even with the shortcomings of current teacher education and licensing, fully prepared and certified teachers are better rated and more successful with students than teachers without this preparation (Evertson et al., 1985; Ashton & Crocker, 1986; Ashton & Crocker, 1987; Greenberg, 1983; Haberman, 1984; Olsen, 1985). As Evertson and colleagues conclude in their research review:

The available research suggests that among students who become teachers, those enrolled in formal preservice preparation programs are more likely to be effective than those who do not have such training. Moreover, almost all well planned and executed efforts within teacher preparation programs to teach students specific knowledge or skills seem to succeed, at least in the short run.

(Evertson et al., 1985, 8)

The importance of full preparation holds across specific subject-matter fields. A review of research on science education, incorporating the results of more than 65 studies, found consistently positive relationships between students' achievement in science and their teacher's background in both education courses and science courses (Druva & Anderson, 1983; see also Davis, 1964; Taylor, 1957). The effects of teacher training are particularly noticeable when achievement is measured on higher order tasks such as students' abilities to apply and interpret scientific concepts (Perkes, 1967–8). Students' performance in mathematics is also strongly related to their teachers' preparation in teaching methods as well as in mathematics content (Begle, 1979; Begle & Geeslin, 1972; Hawk et al., 1985). The importance of teachers' education preparation has also been established for teachers of vocational education (Erekson and Barr, 1985), teachers of reading and elementary education (Hice, 1970; LuPone, 1961; McNeil, 1974), teachers in early childhood education (Roupp et al., 1979), and teachers of gifted students (Hansen, 1988).

Other studies point out the differences in the perceptions and practices of teachers with differing amounts and kinds of preparation. A number of studies suggest that the typical problems of beginning teachers are lessened for those who have had adequate preparation prior to entry (Adams et al., 1980; Glassberg, 1980; Taylor & Dale, 1971). Teachers who are well prepared are better able to use teaching strategies that respond to students' needs and learning styles and that encourage higher order learning (Perkes, 1967–8; Hansen, 1988; Skipper & Quantz, 1987). Since the novel tasks required for problem-solving are more difficult to manage than the
routine tasks associated with rote learning, lack of knowledge about how to manage an active, inquiry-oriented classroom can lead teachers to turn to passive tactics that “dumb down” the curriculum (Carter & Doyle, 1987; Doyle, 1986), busy students with workbooks rather than complex tasks that require more skill to orchestrate (Cooper & Sherk, 1989).

Studies of teachers admitted with less than full preparation—with no teacher preparation or through quick alternate routes—reveal serious shortcomings: Recruits tend to be dissatisfied with their training; they have greater difficulties planning curriculum, teaching, managing the classroom, and diagnosing students’ learning needs. They are less able to adapt their instruction to promote student learning and less likely to see it as their job to do so, blaming students if their teaching is not effective. Principals and colleagues rate them less highly on their instructional skills, and they leave teaching at higher-than-average rates. Most important, their students learn less, especially in areas like reading, writing, and mathematics, which are critical to later school success. These feelings undoubtedly contributed to the high attrition rate of TF A recruits. TF A statistics show that of those who started in 1990, 58 percent had left by the third year, a two-year attrition rate more than twice the national average for new teachers, including those in cities. The Maryland State Department of Education reported that 62 percent of corps members who started in Baltimore in 1992 had left within two years.

This track record is not unusual for alternative certification programs. Stoddart’s (1992) analysis reveals that 53 percent of Los Angeles’ alternative certification recruits (prepared in an eight-week summer program run by the district) had left within the first six years of program operation. California’s state evaluation found that 20 percent of recruits dropped out before completing the training. Of those who completed the training, 20 percent left during the first two years of teaching, and another 20 percent of the remainder were not deemed ready for employment by the end of year two (Wright et al., 1987).

Of 110 Dallas recruits, only 54 percent had successfully “graduated” to become full-fledged teachers after their first year as interns (Lutz & Hutton, 1989). Of this group, 24 had the possibility of “graduating” at some point in time if deficiencies in meeting program requirements were cleared up, along with 14 who were requested to continue as interns for another year in hopes that they could improve their performance sufficiently. Only 40 percent of these alternate route interns said they planned to stay in teaching, as compared to 72 percent of traditionally trained recruits.

Across a range of nontraditional programs reviewed by the Rand Corporation, 75 percent of recruits who had not previously been teachers remained in teaching after two years, while only half planned to make it their career. Among these, candidates admitted through short alternative routes were least likely to say they planned to stay in teaching; mid-career recruits trained in master’s degree programs were most likely to plan to stay in teaching (Darling-Hammond et al., 1989).

THE CAPACITY OF SCHOOL DISTRICTS TO PREPARE TEACHERS

The idea that school districts have the will and the capacity to train and mentor teachers unilaterally and well has been tested repeatedly without success. The literature of the late 1960s and early 1970s was full of such proposals, and the schools were full of pilots very much like today’s short-term alternative routes. The reasons are simple: the districts where most new teachers are hired are poor urban and rural districts with high turnover and few resources. They do not have the level of fiscal or pedagogical resources to take on this job. Neither do they have a strong self-interest in investing thousands of dollars in the preparation of beginners, most of whom will leave for other occupations or suburban schools as soon as they are able. Over and over again, reviews of such district-based efforts find that they leave their candidates underprepared,
undersupported, and less effective than candidates who received systematic university-based
preparation for teaching.

There are at least three kinds of problems studies have noted with these programs: the amount
of time for training, the nature of teaching knowledge conveyed, and the extent and nature of
supervision.

School districts are necessarily impatient about the time teachers spend learning rather than
covering classes that need to be taught. Virtually all district-run and vendor-provided programs
for training teachers are extremely short, generally ranging from three to eight weeks in duration.

Because they are short-term, alternative certification programs provide little pedagogical
coursework and no subject matter coursework or extended practicum experience; recruits’
“practicum” consists of their first year(s) of full-time teaching. Pedagogical training tends to focus
on generic teaching skills rather than subject-specific pedagogy, on singular techniques rather
than a range of methods, and on specific, immediate advice rather than research or theory (see
Stoddart, 1992; Bliss, 1992; Zumwalt, 1990). These choices are a necessary consequence of the
short period of time available. As one program coordinator in New Jersey’s Provisional Teacher
program explained: “The condensed time frame of 200 hours of formal instruction places serious
limitations on the amount of curriculum content that can be covered (Brown, 1990).

These constraints, and the current status of teaching knowledge in many of the districts that
mount their own programs or hire teachers with little preparation, lead to a predilection for
teacher-proof approaches to training and curriculum that undermine most of the current reforms
in teaching and learning. Packaged programs like Distar, ITIP, and Assertive Discipline are fre-
quently used. Although these approaches do not allow teachers to teach diagnostically or in ways
that support the acquisition of higher order thinking skills, they can be “taught” in a day-long
workshop and require almost no sophisticated knowledge or skill on the part of teachers. When
these programs fail to meet many of the teacher’s goals and the students’ needs, teachers, have
no powerful theories or alternative techniques to marshal.

The lack of traditional coursework (and, often, student teaching) in these programs is generally
supposed to be compensated for by intensive mentoring and supervision in the initial months of
full-time teaching. However, promised mentors do not always materialize. As the RAND report on
nontraditional programs noted:

. . . Ironically, given that these (alternative certification) programs presumably emphasize
on-the-job training in lieu of standard coursework, the alternative program recruits in our
sample received substantially less assistance and supervision than recruits in any of the
other types of programs.

(Darling-Hammond et al., 1989, 106)

In this study, fewer than a third of alternative certification recruits spent an hour or more each
week working with a support person as compared to three-quarters of the recruits in graduate
school programs. Other studies have also commented on the unevenness of supervision in AC
programs, particularly those that rely on local district resources (Adelman, 1986; Cornett, 1992).

Several studies found that New Jersey’s alternate route teachers rarely received the combina-
tion of supervision, training, and mentoring services required by the program (Gray & Lynn,
1988; Smith, 1990a, 1990b). For example, 99 percent of AC candidates had no meeting with their
support team and 67 percent did not meet with their mentors within the first four weeks of
teaching, when their teaching was supposed to be “intensively supervised.” Over two-thirds did
not receive the daily supervision they were to receive, and nearly one-quarter were not observed
by anyone at all during this time. By comparison, 96 percent of student teachers were supervised
daily (Smith, 1990a, 1990b). School districts were generally unable to provide these services,
given the fiscal resources and staff time available to them (Smith, undated).
Even where state resources are available, the promise of serious supervision is not always easy to meet. Despite state funding for mentors, 15 percent of California’s alternative certification trainees reported that they had not met with any support person at all during their first year of teaching; fewer than 20 percent had the advantage of meeting at least once a week with a support person (Wright et al., 1987, 82–3).

Reviews of the availability and quality of preparation and supervision offered by university-based programs, on the other hand, have generally been positive (see e.g. Coley & Thorpe, 1985; Darling-Hammond et al., 1989; Sundstrom & Berry, 1989; Smith, 1990b). Many studies have found that, over time, alternative certification programs have added coursework requirements as gaps in teachers’ preparation have been identified, and states and districts have increasingly turned to universities to provide coursework and supervision (Hudson et al., 1988; Carey et al., 1988; Cornett, 1992).

Programs launched by states, districts, and other non-university sponsors have also been unstable. One recent study of nontraditional programs for preparing mathematics and science teachers found that during the year in which a survey was being conducted, eight out of 64 programs had already disappeared, while several others were unsure as to whether they would continue in the following year (Carey et al., 1988). Discontinuation was related to funding, reputation, availability of recruits, and stability of the agency operating the program. Programs that survived had broadened their target recruitment pools, refined their programs, and had become attached to university-based teacher education programs, if they were not already part of such programs.

Similarly, Lutz and Hurron (1989, 251) point out the dramatic shrinkage over several years in the alternative certification programs operated by the Houston and Dallas Independent School Districts, speculating that the decline may be attributed “to a shrinking pool of qualified applicants or the high financial cost of such programs, which are carried by the local school district.” For these and other reasons—including a preference for traditionally trained and certified candidates—most districts in states that allow alternative certification programs do not participate in them (Gray & Lynn, 1988; Wright et al., 1987; Mitchell, 1987).

RECENT RESPONSES TO CRITIQUES OF TRADITIONAL TEACHER EDUCATION

Lest schools of education become sanguine, however, there are grounds for concern about traditional preparation programs as well. One major aspect of the critique of teacher education is that, particularly in the years after normal schools were abandoned for university departments, and in the places where lab schools or other kinds of partner schools never emerged, many teacher education programs seemed to separate theory and application to a large extent. In some places, teachers were taught to teach in lecture halls from texts and teachers who frequently had not themselves ever practiced what they were teaching. Students’ courses on subject matter topics were disconnected from their courses on teaching methods, which were in turn disconnected from their courses on foundations and psychology. Students completed this coursework before they began student teaching, which was a brief taste of practice typically appended to the end of their program with few connections to what had come before. Many encountered entirely different ideas from those they had studied in the classrooms where they did their student teaching, because university and school-based faculty did little planning or teaching together. Sometimes, their cooperating teachers were selected with no regard for the quality or kind of practice they themselves engaged in. When new teachers entered their own classrooms; they could remember and apply little of what they had learned by reading in isolation from practice. Thus, they reverted largely to what they knew best: the way they themselves had been taught.
The often-repeated critiques of traditional teacher education programs include:

- Traditional views of schooling: because of pressures to prepare candidates for schools as they are, most prospective teachers learn to work in isolation, rather than in teams, and to master chalkboards and textbooks instead of computers and CD-ROMS (National Commission on Teaching and America’s Future, 1996, p. 32).
- Inadequate time: the confines of a four-year undergraduate degree make it hard to learn subject matter, child development, learning theory, and effective teaching strategies. Elementary preparation is considered weak in subject matter; secondary preparation, in knowledge of learning and learners.
- Fragmentation: elements of teacher learning are disconnected from each other. Coursework is separate from practice teaching; professional skills are segmented into separate courses; faculties in the arts and sciences are insulated from education professors. Would-be teachers are left to their own devices to put it all together.
- Uninspired teaching methods: for prospective teachers to learn active, hands-on and minds-on teaching, they must have experienced it for themselves. But traditional lecture and recitation still dominates in much of higher education, where faculty do not practice what they preach.
- Superficial curriculum: once-over-lightly describes the curriculum. Traditional programs focus on subject-matter methods and a smattering of educational psychology. Candidates do not learn deeply about how to understand and handle real problems of practice.

Over the past decade, many schools of education and school districts have begun to change these conditions. Stimulated by the efforts of the Holmes Group and the National Network for Educational Renewal, more than 300 schools of education have created programs that extend beyond the confines of the traditional 4-year bachelors degree program, thus allowing more extensive study of the disciplines to be taught along with education coursework that is integrated with more extensive clinical training in schools. Some are one- or two-year graduate programs that serve recent graduates or mid-career recruits. Others are five-year models that allow an extended program of preparation for prospective teachers who enter teacher education during their undergraduate years. In either case, because the fifth year allows students to devote their energies exclusively to the task of preparing to teach, such programs allow for year-long school-based internships that are woven together with coursework on learning and teaching.

These approaches resemble reforms in teacher education abroad. Countries like Germany, Belgium, and Luxembourg have long required from two to three years of graduate level study for prospective teachers on top of an undergraduate degree—sometimes with two disciplinary majors—in the subjects to be taught. Education courses include the study of child development and learning, pedagogy, and teaching methods, plus an intensively supervised internship in a school affiliated with the university. Many other nations have recently launched similar reforms.

In 1989, both France and Japan undertook major teacher education reforms to extend both university- and school-based training. In France, all candidates must now complete a graduate program of teacher education in newly created University Institutes for the Preparation of Teachers that are closely connected to schools in their regions. In Japan, although most candidates still prepare in undergraduate programs, they have lessened responsibilities in their first year of teaching and continue to engage in significant study through a highly structured induction program. Recent reforms in Taiwan include graduate-level preparation for teachers plus a yearlong induction program.

A number of recent studies have found that graduates of extended (typically five year) programs are not only more satisfied with their preparation, they are viewed by their colleagues, principals, and cooperating teachers as better prepared, are as effective with students as much
more experienced teachers, and are much more likely to enter and stay in teaching than their peers prepared in traditional four-year programs (Andrew, 1990; Andrew & Schwab, 1995; Arch, 1989; Denton & Peters, 1988; Dyal, 1993; Shin, 1994).

Many of these programs have joined with local school districts to create professional development schools where novices’ clinical preparation can be more purposefully structured. Like teaching hospitals in medicine, these schools aim to provide sites for state-of-the-art practice which are also organized to support the training of new professionals, extend the professional development of veteran teachers, and sponsor collaborative research and inquiry. Programs are jointly planned and taught by university-based and school-based faculty. Cohorts of beginning teachers get a richer, more coherent learning experience when they are organized in teams to study and practice with these faculty and with one another. Senior teachers report that they deepen their knowledge by serving as mentors, adjunct faculty, co-researchers, and teacher leaders. Thus, these schools can help create the rub between theory and practice that teachers need in order to learn, while creating more professional roles for teachers and building knowledge in ways that are more useful for both practice and ongoing theory-building (Darling-Hammond, 1994).

These new programs typically engage prospective teachers in studying research and conducting their own inquiries through cases, action research, and the development of structured portfolios about practice. They envision the professional teacher as one who learns from teaching rather than one who has finished learning how to teach, and the job of teacher education as developing the capacity to inquire sensitively and systematically into the nature of learning and the effects of teaching. This is an approach to knowledge production that John Dewey (1929) sought one that aims to empower teachers with greater understanding of complex situations rather than to control them with simplistic formulas or cookie-cutter routines for teaching.

Command of scientific methods and systematized subject matter liberates individuals; it enables them to see new problems, devise new procedures, and in general, makes for diversification rather than for set uniformity (12). This knowledge and understanding render (the teacher’s) practice more intelligent, more flexible, and better adapted to deal effectively with concrete phenomena of practice . . . Seeing more relations he sees more possibilities, more opportunities. His ability to judge being enriched, he has a wider range of alternatives to select from in dealing with individual situations.

(Dewey, 1929, pp. 20–1)

If teachers investigate the effects of their teaching on students’ learning, and if they read about what others have learned, they come to understand teaching “to be an inherently problematic endeavor, rather than a highly routinized activity” (Houston, 1993, p. 126). They become sensitive to variation and more aware of what works for what purposes in what situations. Access to nuanced knowledge allows them to become more thoughtful decision makers.

Training in inquiry also helps teachers learn how to look at the world from multiple perspectives; including those of students whose experiences are quite different from their own, and to use this knowledge in developing pedagogies that can reach diverse learners. Learning to reach out to students—those who are difficult to know as well as those who are easy to know—requires boundary crossing, the ability to elicit knowledge of others and to understand it when it is offered. As Lisa Delpit (1995) notes, “we all interpret behaviors, information, and situations through our own cultural lenses; these lenses operate involuntarily, below the level of conscious awareness, making it seem that our own view is simply ‘the way it is’ ” (p. 151). Teachers concerned with democratic education must develop an awareness of their perspectives and how these can be enlarged to avoid a “communicentric bias” (Gordon, 1990) which limits understanding of areas of study as well as of those who are taught.
Developing the ability to see beyond one’s own perspective—to put “oneself in the shoes of the learner and to understand the meaning of that experience in terms of learning—is, perhaps, the most important role of universities in the preparation of teachers. One of the great flaws of the “bright person myth” of teaching is that it presumes that anyone can teach what he or she knows to anyone else. However, people who have never studied teaching or learning often have a very difficult time understanding how to convey material that they themselves learned effortlessly and almost subconsciously. When others do not learn merely by being told, the intuitive teacher often becomes frustrated and powerless to proceed. This frequently leads to anger directed at the learner for not validating the untrained teacher’s efforts. Furthermore, individuals who have had no powerful teacher education intervention often maintain a single cognitive and cultural perspective that makes it difficult for them to understand the experiences, perceptions, and knowledge bases that deeply influence the approaches to learning of students who are different from themselves. The capacity to understand another is not innate. It is developed through study, reflection, guided experience, and inquiry.

A commitment to open inquiry, the enlargement of perspectives, and the crossing of boundaries are critical features of the ideal of university education. In fact, the basis of the very earliest universities was that they tried to bring together scholars from all over the known world. They sought to create ways to share diverse perspectives from various geographic areas, cultures, and disciplines as the basis for developing knowledge and finding truth. If universities are to continue to make the important contribution to the education of teachers that they can make, they need to pursue these ideals of knowledge-building and truth-finding by creating a genuine praxis between ideas and experiences—by honoring practice in conjunction with reflection and research and by helping teachers reach beyond their personal boundaries to appreciate the perspectives of those whom they would teach.

3.2 Leaving authority at the door

Equal-status community-based experiences and the preparation of teachers for diverse classrooms

Barbara Seidl and Gloria Friend

In a time when the society in the United States is becoming increasingly culturally and socioeconomically diverse we are all called upon to become bicultural or multicultural people, capable of moving competently between sociocultural worlds in ways that honor and respect and do not dominate, appropriate, and oppress others. We are called upon to explore more profoundly our human capacity to love, care for, and support others, and, in particular, those whose lives and social realities differ from our own, and to, as Delpit (1995, p. 151) demands, engage “in the hard work of seeing the world as others see it”. We are also called upon to define our positions as antiracist individuals within a commitment to social justice. This challenge is felt urgently in the preparation of teachers for public schools where it is estimated that by the year 2050, students of color will exceed 50 percent of the total population while the teaching force will remain predominantly white (American Association of Colleges of Teacher Education, 1994).

The question of how to prepare teachers for culturally rich and economically diverse classrooms is central to teacher education efforts in many countries. Teacher educators in the US, like their counterparts in Canada (Darling & Ward, 1995; Ward, 1998), have tried numerous approaches, but the question remains, for the most part, unanswered. Coursework on multicultural education, workshops, and placements in urban schools have been a popular response to the challenge, but these attempts have produced mixed (Melnick & Zeichner, 1998) and often negative results (Haberman & Post, 1992; Zeichner, 1992). Prospective teachers often continue to view diversity within a deficit framework and use individual explanations for success and failure with little awareness of the larger social context in which opportunity is distributed (Paine, 1990; Sleeter, 1997). Courses aimed at helping white students deconstruct white privilege have produced positive, but limited, results in supporting the development of mature anti-racist identities. The short duration of these courses, the difficulty of such work in a racist society, and lack of support for continued development make it easy for students to slip from more advanced forms of an anti-racist identity into a stage of reintegration resulting in a perceived lack of efficacy around social justice issues and/or blaming people of color for their oppression (Lawrence & Bunche, 1996; Sleeter, 1997). More recently, community service has been used as a vehicle through which to provide prospective teachers with cross-cultural experiences. Again, such experiences have produced mixed results, often acting to confirm stereotypes and reinforce privilege and cultural authority (Kahne & Westheimer, 1996; McCann, 1996; Morton, 1995). Finally, a factor that further complicates multicultural teacher education is the lack of faculty of color within teacher education programs. It is all too common to find predominantly white teacher education faculty who have had little experience in diverse settings (Ducharme & Agne, 1989).
teaching white students about how best to teach children of color. In short, teacher education continues to struggle to find experiences sufficiently powerful to support students in deconstructing the messy tangle of racism, classism, poverty, sexism, and opportunity and is much less successful in helping students reconstruct maintainable positions within a commitment to social justice.

COMMUNITY PARTNERSHIPS: RELATIONSHIPS AND TRANSFORMATION

The personhood of each of us is shaped by a moving inward intersection of numerous selves-family and friends and colleagues and strangers. If we are to grow as persons and expand our knowledge of the world, we must consciously participate in the emerging community of our lives, in the claims made upon us by others as well as our claims upon them. Only in community does the person appear in the first place, and only in community can the person continue to become.

(Palmer, 1983, p. 57)

We believe, as Palmer describes, that we emerge as beings through our interactions and relationships with others. And, if our identities are shaped through our relationships with certain people, then they are equally influenced by our lack of contact with others. That is, in a divided and racist society where it is quite common for people, and especially whites, to live largely monocultural lives, and where there are few opportunities to develop significant and caring relationships across ethnic and class lines, many people lack access to the very relationships that might help to create and nurture multicultural identities. Our prospective students are like many of their counterparts in other areas of the country and of the world, in that they have grown up in largely homogeneous cultural communities and have had few cross-cultural experiences (Howey & Zimpher, 1990; Ward, 1998) even with the non-dominant cultural groups that are visible within the community.

In describing what it means to be committed to anti-racist, culturally and racially nuanced social practices, Thompson (1998) challenges these segregated social patterns and calls on white theorists and others to step outside the comfortable, narrow community of relationships that define their personal worlds to,

[. . .] change how we live: our habits, our neighborhoods, our circumstances, our political activities, our relationships. If the relationships and situations that we live with on a day-to-day basis allow us to rest comfortably in the knowledge that works best for us, we will not see any reason to change or to inquire into the lives of others.

(p. 544)

We believe that if teacher education is committed to preparing teachers for diverse classrooms, then we must take seriously the challenge of “changing our habits”. If our communities of relationships limit the very relations that are essential for helping to develop anti-racist identities and bicultural competency, then we must move to forge broader communities through which to learn and grow.
Forging bridges between traditionally divided communities to create broader communities of relationships has been the goal of a 3-yr partnership between a Masters in Education program at The Ohio State University and the Mt. Olivet Baptist community located in the same city. The Literacy Education and Diverse Settings, Masters of Education (LEADS M.Ed.) program is a five-quarter, fifth year, teacher certification program. As in most teacher education programs, the students in the LEADS program (~30 per year) are predominantly white, as is the university faculty, and most students lack experience with diverse socioeconomic and cultural communities. The program, however, is committed to preparing teachers for diverse classrooms and, specifically, for preparing teachers for local public schools where over 60 percent of the students are African American. The Mt. Olivet community is a large, socioeconomically diverse, African American community with a congregation of ~1400 members. The church operates and houses Mt. Olivet Christian Academy (MOCA), a private Christian school serving children from kindergarten through sixth grade, as well as many other programs for children and adults from the Mt. Olivet community and from the surrounding neighborhood.

Throughout the life of our partnership, we have attempted to develop a relationship that is mutually beneficial and reciprocal; that is, both partners benefit in ways particular to their needs and share expertise particular to their strengths (Seidl & Friend, 2002). Thus, while the Mt. Olivet community provides support for our teacher education students, university faculty works to connect the Mt. Olivet community with resources and expertise available through the university. We have also attempted to avoid, the traditional authoritative stance universities occupy in such partnerships and the damaging and exploitive effects universities and, particularly, research institutions, have on culturally diverse communities. In such relationships, the push to do research positions communities as data collection sites and produces a racist research discourse, while the relationship often ends when the grant runs out or when the research is concluded. Within our partnership we have worked to develop a mutually beneficial relationship; one in which a research agenda is collaboratively constructed.

Our partnership holds multiple goals for our prospective teachers. Our overall goal is to support them towards mature anti-racist identities so that their future work with children is situated within a more sophisticated understanding of racism and inequity. We use the terms anti-racist identities and anti-racist commitments instead of other terms, such as multicultural or culturally competent, because we believe that the term anti-racist represents a commitment to an overt and activist personal and political stance (Lee, 1997). This commitment encompasses the knowledge of diverse ways of living and the need for bicultural or multicultural competency and, for teachers, the need for developing culturally relevant pedagogies. In addition, anti-racist education challenges the structural inequities that are rendered legitimate through policies, laws, and social norms (Thompson, 1997) and that are invisible to many whites. Anti-racist terminology can be found in multicultural scholarship in both the United States and Canada (Lee, 1997; Nieto, 2000; Thompson, 1998). We draw from the work of scholarship in anti-racist identity development (Derman-Sparks & Phillips, 1997; Helms, 1990; Tatum, 1992) to situate our efforts within a developmental pedagogy. The work of these scholars demonstrates the positive outcomes associated with concerted and deliberate efforts to help white students and students of color grow in their ability to identify and work against the personal, institutional, and cultural patterns of racism. Our aims are not to replicate their work, nor use it to evaluate our effectiveness. We are more interested in understanding the attitudes, beliefs, and behaviors that are common for students within that process of growth and development as well as the kinds of experiences that support growth toward more mature identities.

There is little research regarding anti-racist teacher education curricula and increased student achievement. However, we draw from research that documents the work of exemplary teachers
for children of color (Foster, 1997; Irvine, 1992; Ladson-Billings, 1994). This research indicates that these teachers have had the life experiences that have helped them learn to recognize and work against racism. Their intercultural competencies allow them to act as cultural interpreters who support their students’ identity development as well as support them in acquiring competency in the mainstream discourse. In short, these teachers have mature anti-racist identities and have developed culturally relevant pedagogies in response to this commitment. It is toward the exemplary vision of these teachers that we work. We do not claim, given the limited time we have with students, that it is possible for them to develop mature anti-racist identities, nor can they develop culturally relevant pedagogies, within a year. While some students move a great deal towards these goals, growth depends upon prior experiences. Given that most of our students enter our program with very little cross-cultural experience, our primary goal is to nurture a disposition and commitment to sustaining the personal and professional work they begin during their experience within the partnership.

AN EQUAL-STATUS, CROSS-CULTURAL INTERNSHIP

Towards these ends, we have constructed an equal-status, community-based internship for our prospective teachers, described in greater detail elsewhere (Seidl & Friend, 2002). LEADS M.Ed. students spend two to three hours a week at Mt. Olivet working with adults from Mt. Olivet in programs for children developed by the community. There are a number of different options through which to fulfill the requirements of the community-based internship. Some students work with an extended care program that is part of the Mt. Olivet Christian Academy. They work with teacher assistants from the Academy to help children finish homework and to plan and implement learning and recreational activities. Other students work with a male-mentoring program in the church, I’m Making a Godly Expression (IMAGE). The IMAGE program is organized by a men’s group in the church, and serves fourth and fifth grade boys from a nearby public school. These students work with the men to provide tutoring in reading and math and to plan and participate in recreational activities for the boys. They also have the privilege of being part of the unity circle—an experience intended to provide spiritual and cultural education for the boys. LEADS students have also had the opportunity to work as interns with teachers in the Mt. Olivet Christian Academy and with Sunday School classes.

Mediation of our students’ experiences is very important to our work, with the two authors of this chapter bearing primary responsibility for this mediation. Dr. Friend is a member of the Mt. Olivet community, the principal of the Mt. Olivet Christian Academy, and minister in the church. Dr. Seidl is a faculty member at the university, responsible for coordination between the university and Mt. Olivet. Coursework at the university in literacy, foundations classes, and other methods classes requires that students read, think, and write about the sociopolitical context of racism, the role of education in an inequitable society, and their responsibilities as teachers with children from diverse backgrounds. The internship is also mediated in planned and structured conversations facilitated by faculty from the university and members of Mt. Olivet. In addition, students have opportunities to talk with parents, teachers, and different members of the Mt. Olivet Community.

EQUAL-STATUS CONTACT

We have been committed to developing the internship as an equal-status experience; a goal aligned with our commitment to rethinking and reconstructing the social relations that characterize relationships in a racist and classist society. The concept of equal-status contact can be traced back to Allport’s (1954) work in prejudice reduction and is also located in mainstream multicultural
theory (Banks & Banks, 1997; Grant, 1990). Allport, summarizing work in intercultural contact, maintained that when whites experience contact with African Americans who are of equal or greater economic or professional status, there is greater likelihood for a reduction in bias and/or prejudice. On the other hand, contact between whites and blacks where blacks occupy a lower occupational or economic status is “an active factor in creating and maintaining prejudice” (p. 274). Until recently, defining and pursuing such contact as a part of teacher education has remained largely unexplored. A recent exception to this is work at the University of New Mexico (Smolkin & Suina, 1999), where the teacher education faculty is committed to an “equal other” experience for their Native American students.

We believe that equal-status, cross-cultural experiences are critical to anti-racist identity development. Too often a white student’s initial contact with a community of color is one of unequal status in which they occupy privileged cultural and economic positions and maintain a sense of cultural authority. In such cases they often perceive their role as charitable or helping “those less fortunate.” Such positioning promotes the likelihood that they will evaluate different cultural contexts as deficient, appropriate diverse cultural patterns within a dominant framework, or resist recognition of inequity by drawing from available racist ideologies (Sleeter, 1992; Thompson, 1998). We believe that, for white students who have had few significant cross-cultural experiences, unequal status contact such as service projects or placements in urban schools remain situated within the dominant Eurocentric cultural paradigm and allow students to maintain a privileged cultural authority. On the other hand, an equal-status partnership is better positioned to de-center this privileged cultural stance and help them begin to question their own hegemonic cultural beliefs and the racist social ideologies that sustain them.

While equal-status relationships may assume many forms, we feel that there are a number of characteristics that are essential to such an experience. First, equal-status, cross-cultural experiences place students not as helpers within a context, but as learners and participants in a community that is not essentially dependent upon their service. As partners, the Mt. Olivet community and the LEADS M.Ed. program come together in a mutual dependency, each with different needs and contributions, to pursue particular and common goals. No one partner holds the monopoly on knowledge and no one partner is placed in the role of receiving charity from the other--each brings an expertise that enriches the other. For example, our teacher education students understand that they are learners in a position of receiving invaluable support and information on their journeys to become teachers. None of the programs they work with are dependent upon their services. On the other hand, their contributions to the programs and their emerging expertise in teaching are publicly valued by the community.

Second, an equal-status experience places our prospective teachers in working relationships with adults. It is quite common for white prospective and practicing teachers to feel comfortable in developing what are often problematic relationships with children of color. Many teachers adopt a “Messiah” complex (Thompson, 1998) where their relationships are based on feelings of pity and a desire to save children from what they perceive to be uncaring families and communities. Peer relationships with people of color are far less commonly negotiated by whites, especially when outside of a helping role. Engaging in equal-status, peer relationships with adults requires developing a bicultural competency that we feel is critical to teachers who will need to build strong and positive relationships with parents, teachers of color, and other community members. Third, as Mt. Olivet is a socioeconomically diverse community, our students meet and work with adults who are their peers, economically and professionally. Such equal-status contacts with adults of color challenge the stereotypes of people of color most commonly forwarded through the media-stereo types based in youth culture and/or conditions of poverty. In addition, witnessing the many images of parenting available within such a context challenges our students’ perceptions and generalizations that African American children need to be “saved.”

Finally, an equal-status experience places our students within an intact, African American
Mt. Olivet, like many black churches in both the United States and Canada, has remained somewhat economically and politically independent of the dominant society (Poole, 1990; Walker, 1979), preserving African American traditions, norms, values, and cultural patterns to provide a protective environment within which its members can grow and thrive (hooks, 1992; West, 1993). That white students participate in a strong and intact African American cultural context is important. First, the context itself initiates an awareness of our students’ cultural and raced identities. Students find themselves in situations where they are uncertain of the norms and mores that govern patterns of social interaction, whether it be in the church school context or in attending a church service. They are also exposed to the role the church has played in supporting the physical survival and dignity of African Americans in a racist society. Race, and consequently, racism, as issues to be dealt with cannot be avoided within this context. Third, in this society, a history of racism and discrimination has created a disproportionate number of people of color in situations of long-term, generational poverty. Public images that portray welfare mothers as predominantly black, violence as endemic to the black community, and black children as behavioral problems in schools, make it easy for whites to equate the outcomes of racism and poverty with African American culture (Sleeter, 1997). Mt. Olivet represents a diverse economic context ranging from families who struggle economically to economic, professional, and political leaders from the black community. In addition, a number of the programs in the church serve children from surrounding neighborhoods—communities impacted by long-term and generational poverty. The diverse economic context and the strong cultural context of the Mt. Olivet community make it possible to begin to deconstruct this culture/poverty conflation. In sorting out the differences between culture and the effects of poverty, we attempt to move our students toward an understanding of the relationship between racism and classism.

Overall, we believe that the equal-status internship requires that our students leave their cultural authority at the door. In becoming tentative learners in an unfamiliar cultural and political space, we hope they experience, to some degree, what it means to cross borders and to be humble in the face of the unknown. We also hope that they gain a new form of confidence that rests, not upon privileged cultural authority, but in the shedding of conscious and unconscious racist beliefs and practices and the emerging knowledge and bicultural competencies that will allow them to be active participants in the creation of a more just society.

LEARNING TOGETHER

We have worked and grown together for over three years now. No two years have been exactly alike, as we have found it necessary each year to respond to specific university and community needs. However, equal-status experiences and mediation have been central to our work each year. Over these three years we have maintained field notes of community/university meetings, classroom dialogue, and mediation meetings. Student works we have collected include reflective journals, assignments from a number of different courses, and final Masters papers. The data we have collected across this three year period has shaped our understanding of how students grow and develop within the partnership as well as guided our efforts in framing the internship and organizing experiences between our communities. The two authors of this paper, a white university professor and a black minister and principal from Mt. Olivet, have been engaged in a reiterative analysis of this data. Methodologically we employ a grounded process (Strauss & Corbin, 1994) situated within a recursive, collaborative dialogue between the two authors. Within this process of recursive analysis we have been committed to a reflective comparison of our two cultural interpretations.

Overall, we are interested in supporting our students toward more mature anti-racist identities, toward bicultural competency, and toward a commitment to culturally relevant teaching. Thus, we
have considered our students’ work and our discussion group data with an eye toward the attitudes, beliefs, and/or behaviors that we feel represent movement toward or away from that goal. What we share here are the patterns we have found repeated among the three cohorts of students who have been involved in the partnership. We have chosen quotes from reflective journals, Masters’ papers, and class discussions that we feel are representative of those patterns. We are optimistic. Many of our students do develop more mature and sophisticated understandings of issues of culture, racism, and education and, depending upon their prior experiences, many are well on their way to developing more mature anti-racist identities. On the other hand, we are also reminded of the resiliency of long-held social and cultural beliefs as some students demonstrate little growth, remaining within a fixed dominant paradigm and displaying many of the ideological defenses white students utilize to resist personal and social transformation.

DEFINING POSITIVE GROWTH

One of our primary goals is to challenge our students’ sense of cultural authority; we consider it a positive step when students express a sense of uneasiness upon their first visits to Mt. Olivet. This communicates to us that they are *de-centering cultural authority*—that they are aware of being in an unfamiliar cultural context where they are outsiders with little awareness of the cultural norms being practiced. In addition, we believe this uneasiness also means that our students are aware of the state of race relations within the world and that there is increased probability that they will move out of a naïve racial innocence in which feeling comfortable and getting along are the primary desired outcomes (Thompson, 1998). Shelly, a young white woman from an affluent suburb who had had little experience with cultural diversity, demonstrates, we believe, an appropriate and positive initial awareness of a racialized identity and the need to be thoughtful of her position within a raced world.

In my life, I have dealt with a lot of different sorts of people. African Americans, though, is one group I have not dealt with to a very large degree . . . I can’t think of a highly influential relationship I have had with a Black person (who was not a kid). This fact, combined with the fact that (I feel) interactions between White and Black people in the US are so hyped up, that I find myself very nervous about dealing with black people in peer-type relationships. I know that my nervousness is a symptom of my intense desire for things to “just go well”, but in any case, it is unproductive. I think I need to work to get rid of my paranoia that everything I do or say is being examined for racist content. I wonder sometimes why I have this paranoia. I feel defensive at times, like “hey, just because I am White doesn’t mean . . .” But why am I so defensive? This is definitely something I might re-examine.

Even here, in a personal piece of writing I feel self-conscious, lest I make some politically incorrect remark, or indicate that I am not enlightened in some way.

(Shelly, Reflective Journal, 2000)

The development of sophisticated, culturally relevant pedagogies is a process that requires commitment over time and lived experience. It is impossible for our students to unlearn years of racist socialization and develop anti-racist and sophisticated bicultural identities in one year. Thus, what we hope for is that our students begin to understand the difficulties that arise when schools are not responsive to children’s sociocultural experiences. Jill’s journal illustrates the degree to which her experiences with a program at Mt. Olivet helped her more fully appreciate the *sociocultural incongruity* that many children of color experience in public schools.

Sometimes when you read something or hear something it makes sense intellectually but it
just doesn’t feel right. In many of the readings over the last year that had to do with culture, they made sense intellectually but I had a hard time feeling they were correct or real. That little things that are different between the dominant white culture and nondominant cultures could cause minority children not to perform as well as children from the dominant culture didn’t feel like an adequate explanation. I thought that it may have some part but surely couldn’t explain it fully. I still did not feel that cultural differences could fully explain failure till I started in the summer camp/summer school program at Mt. Olivet. . . . After a couple of days I could see many similarities between my experience and that of a young black child entering a school and classroom that is based on white culture and has as its directors people from that culture. It was a rare event in my life and I felt lost as if everyone knew what was going on but me.

(Jill, Final Masters’ Paper, 1998)

The degree to which she felt “lost” supported Jill in understanding how what appeared to her to be the “invisible” values, assumptions, and patterns of communications in schools advantage certain children while simultaneously disadvantaging others. While she must maintain a commitment to efforts to identify these conditions, her experience is one that we believe will help her first question the viability and supportiveness of the context of education before she questions the abilities of children.

It is important that prospective teachers begin to understand the political context of education for African American children and to think about how they might deliberately construct curriculum aimed at helping children identify and deal with racism. Thus, we want our students to begin to recognize the alternative social reality constructed at Mt. Olivet, a social reality in which culturally affirming images and patterns of interaction become cultural resources for resisting the negative images of the larger social world. Peggy’s journal entry captures her understanding of the political context of education within the Mt. Olivet Community.

It is amazing to me that so many adults work so hard to create an environment in the school that is effective. The purpose of such commitment is to raise confident, able African-American children. This is their life. With racism active in society, with the rebellious acts of African American children, with schools that continually and unconsciously pass down hegemony of discrimination, it seems only natural that the members of Mt. Olivet band together to create a place to conflict these social realities. Unfortunately, Mt. Olivet is the only place I’ve seen such unified dedication.

[. . .] It’s almost as if someone sat down and thought of necessary concepts for survival as an African-American and then constructed a school to implement those concepts.

(Peggy, Reflective Journal, 1998)

RECOGNIZING OUR CHALLENGES

As optimistic as we feel about the growth and development of many of our students, we recognize that some of them do not experience a displacement of their cultural authority and maintain encapsulated world views or dysconcious racist beliefs (King, 1991) in which they acknowledge their privilege but feel little responsibility for transforming social inequity. For instance, while many LEADS students come to understand caring as culturally and politically defined, many do not. Some do not suspend their own understandings of what constitutes appropriate and “good” authority, discipline, and structure in order to understand the way in which roles and relationships are culturally and politically situated at Mt. Olivet. Some students, like Kathy, learn to talk about differences but judge these differences from their own personal framework, maintaining a patronizing and judgmental attitude typical of a patronizing cultural authority.
For me, I kind of already knew what to expect in this program, as I was introduced and already had prior experiences working with the Mt. Olivet students and staff. I believed that the after school program was run much like the school day-very structured, and strict. My first night doing service at Mt. Olivet, I realized that my expectations were right-especially for the older students. They are not allowed to talk to one another, or even look around without having permission. I understand however, that this is what is believed is best for them-to get their homework done before going home, and keeping the same expectations on them as they have during the day. The younger students however, get free time, where they are able to make a choice to color or read. They also play games. When I experienced this, I was kind of upset because I think the older kids need to experience some fun as well, instead of constantly being hounded to do homework, and getting yelled at for getting distracted. [. . .]

I have a personal conflict with this because I do not agree with how the older students are treated. However, it is the structure that they are used to, and obviously works well for them. I have come to accept it, and constantly remind myself that it is best for them, and the philosophy of the school.

(Kathy, Reflective Journal, 1999)

Other students, no matter what the support for thinking otherwise, assimilate an understanding of diversity as individual difference. These students maintain, as Thompson (1998) describes, a "racially innocent" narrative where being natural or good means being color-blind. These students white-out difference, in that they assimilate “the experience of people of color to that of whites” (p. 524). Consider Georgia’s final reflection on her experience at Mt. Olivet.

One thing that frustrated me earlier in the year was that I did not feel that I was learning what I needed to be learning. There was so much talk in seminar and in my classes about how we need to learn to work within different communities. Therefore, I thought that we were doing the community based education experience to learn how to work with students across diverse settings. However, I noticed that my interactions and relationships with the students at Mt. Olivet did not differ from the relationships I had with my students at Starling. I finally realized that there was not something I needed to learn how to do in order to be able to relate to these students. The students at Mt. Olivet are just like students anywhere. They are all different and have unique personalities. I think in order to be able to work with students across diverse settings, teachers need to take the time to get to know the individual students because this will help you relate to them and therefore, teach them more effectively and teachers need to have a genuine concern for their students. I think all students need this regardless of race or background.

(Georgia, Reflective Journal, 1998)

Finally, some of our students, instead of seeing themselves as learners within a new cultural context, maintain a dominant cultural authority in that they insist on situating the experience as "service" and seeing themselves as "helpers" within the context. These students are often those who do not (cannot) develop relationships with the adults in the context, seeking instead the relative safety of inequitable power relationships with children. Consider Lynn’s last journal entry. She focuses on how “welcome” she felt in the context, but did not feel needed. The role she was most comfortable with was helper, not learner, and the relationships she focuses on as valuable are those relationships with children with no mention of the adults at Mt. Olivet.

My experience with Mt. Olivet has been overall a valuable one. [. . .] I feel a little confused about the role I played in my Mt. Olivet partnerships, however. I was always treated with an enormous amount of respect from children, parents, and staff at Mount Olivet, and though I
was constantly thanked for the time that I spent there, I never left feeling that my contribution
was necessary or even a help to anyone involved.

Looking back now on my Mount Olivet experience, I wish that I had done things a little
differently. I wish that I would have taken more initiative in the extended care program and
taken a bigger leadership role in that situation. Though I did get to make a small difference
answering questions one-on-one, I never really had a chance to TEACH those kids, and I
would have liked to have had that experience. (. . .) I also wish that I had pushed myself a
little more in getting to know the boys in the Men of the Manna program.

(Lynn, Reflective Journal, 1998)

Georgia, who earlier had insisted that differences of ethnicity and race did not matter, reflects
upon her relationship with children at Mt. Olivet-positioning these relationships in a completely
unproblematized, patronizing and “safe” paradigm where “learning to relate to children of all
ages, background, and race” is completely absent in terms of any attention to the political nature
of her relationship with them and lacks any mention of the need to understand the sociocultural
and political context of their lives.

It was such a treat for me to spend time with the kindergartners and first graders. I enjoyed
talking with them and getting to know them better. They are so sweet and they would always
make me laugh. It is a good experience to learn to relate to children of all ages, background,
and race.

(Georgia, Reflective Journal, 1998)

WHAT WE KNOW ABOUT SUPPORTING GROWTH

As we have reflected upon how our students develop, and, in particular, the experiences students
describe as most powerful, several themes have emerged. For example, we have always
believed that the most powerful vehicles through which to learn about diversity are caring human
relationships. The students who experienced the most growth and who were most accepted at
Mt. Olivet as allies in an anti-racist effort were those who developed close, caring relationships
with an adult in the community. Keith was such a young man. Consider his description of his work
at Mt. Olivet.

Probably the most valuable part of the Mt. Olivet experience was working with Ms. Jordan. I
really learned a lot from Ms. Jordan. I mean, I grew up in a diverse community so I went to
school with kids from lots of different ethnic backgrounds, but I’ve never really had conversa-
tions about differences. Ms. Jordan and I got to know each other. We became friends. I would
come in the mornings early and we would watch the kids and talk. I learned about things like
“ashy skin” and what that means and I learned about greens. We talked a lot about racism
and what that meant. We talked about our lives. We talked about what’s important for educa-
tion for African American kids. I don’t think I would be able to be as effective in my job where I
am now if I hadn’t had those conversations.

(Keith, Classroom Discussion, 1999)

An intellectual approach to learning about racism that remains at an abstract level is diffi-
cult for many students to understand or recognize. In relationships, our students are able to begin to see
and understand the results and impact of racism on the lives of those they care for and, in caring,
are called upon to change and to act.

Furthermore, within this relational context, students learn a great deal from the stories that are
shared. For white students, stories offer a concrete representation of what has largely been abstract and invisible. Stories of racism and antiracism are contextualized lessons that embed theories of racism and cultural diversity in lived experience. Students gather stories and retell them. These stories act as monikers in naming racism, as vicarious memories that they refer to in their efforts to deconstruct the tangled racist ideologies in which they have been socialized. It is quite common to hear students say, “I remember the story Dr. Friend told,” in an effort to understand and connect class readings to concrete examples.

Finally, students learned when engaged in extended dialogue within a diverse group.

The other aspect of our partnership I felt to be most meaningful was our group “community” meetings and discussions with Mt. Olivet staff, parents, etc. I thought it was a very effective way to talk about our differences and similarities and to put these things on the table. I know from experience that bringing two homogeneous groups together can be uncomfortable if there is no discussion about what makes the groups different and how each side can address those differences. I felt these community meetings provided an outlet to talk about some issues that could be analyzed from a multitude of viewpoints. In other words, it was a good way to eliminate any ignorance or generalizations that existed between the two groups.

(Randy, Reflective Journal, 1998)

Randy’s comment captures the manner in which he experienced reciprocity and respect for both sides to be important to the integrity of such dialogue. Such a dialogue does not situate either side as “right” or “wrong”, but instead honors the commitment that each party brings to the pursuit of understanding and growing.

RETHINKING OUR WORK: NEXT STEPS

Developing an anti-racist identity is not a natural, or a frequent, occurrence for most whites in our society. In a world as divided and fractured as ours, such identities must be deliberately nurtured, and opportunities for such development cannot be left to chance. Thus, in evaluating the effectiveness of our internship, we have focused more on the quality of the opportunities we are able to provide our students and less on assessing their progress through pre-established identity development stages. While, as stated earlier, we draw heavily from the work of scholars in antiracist identity development, we are more interested in fleshing out the attitudes, behaviors, and experiences characteristic of students engaged in this work so that we can be more supportive more deliberate-in our efforts with them. We have come to see the development of relationships, the opportunities to share stories, and engagement in extended dialogue as key to supporting the growth and development of our students. However, finding ways to more fully support these experiences is our challenge. In a teacher education program where students complete both degree and certification in a year, there is often less time than needed to organize for these critical exchanges across the partnership.

Yet, we are hopeful. As we finished our third year together we organized an opportunity for the students who were working with the partnership to complete their Masters’ project through involvement in a co-operative inquiry with members of the Mt. Olivet community and university faculty. Within co-operative inquiry (Heron, 1981), “all those involved in the research are both co-researchers, whose thinking and decision making contribute to generating ideas, designing and managing the project, and drawing conclusions from the experience, and also co-subjects, participating in the activity being researched” (Reason, 1994, p. 326). The focus of this inquiry was the question of each of our roles in a commitment to an anti-racist and socially just society. We met each week to engage in extended dialogue around many facets of this question. The
contents of our conversations emerged from shared readings, shared experiences (such as attending a Mt. Olivet service or talking with the pastor or a parent group), and shared stories. Participation in this inquiry provided more of an opportunity for our students to develop relationships with members of the Mt. Olivet community, to share stories, and to engage in reciprocal dialogue. The outcome of our inquiry was a collectively constructed product and the result of a collaborative analysis of the themes, stories, patterns, experiences, etc. that emerged as important to our question.

In conclusion, we believe that cross-cultural encounters that are mutually beneficial and equal status are necessary in the construction of a multicultural and socially just society. If teacher education is to take seriously the preparation of teachers for diverse student populations, then more teacher education students must be engaged in cross-cultural experiences for extended periods of time. Further, the necessary supports must be in place to help mediate these experiences if we are to help prospective teachers begin to develop multicultural competency and anti-racist commitments. We look forward to extended conversations with others around such work.

Rey (eds.), Beyond heroes and holidays: a practical guide to K-12 antiracist, multicultural education and staff development (pp. 26–34). Washington, DC: Network of Educators on the Americas.

3.3 Teachers for multicultural schools

The power of selection

*Martin Haberman and Linda Post*

Multicultural education has much to offer our schools, particularly our urban schools, but simply adding a course or two will not bring about the changes that are needed. Likewise, adding multicultural education to the teacher education curriculum will not be sufficient. In this article, we argue that only teachers with a particular set of attributes and ideology can offer a multicultural curriculum. The stated goals of these curricula emphasize students' personal development. The achievement of such critically important but elusive objectives requires outstanding teachers.

We propose here 12 teacher attributes for offering a multicultural program, focusing on specific teacher qualities and ideology. We describe ways in which teachers explain how they learn, and present a profile of such teachers. Our argument proposes “what” (the content to be learned), “how” (the way it is learned), and “who” seems likely to learn it. The basic contention is that in order to perform the sophisticated expectations of multicultural teaching, selecting those predisposed to do it is a necessary precondition. Training, while vital, is only of value to teacher candidates whose ideology and predispositions reflect those of outstanding, practicing teachers. The article is prefaced by a brief analysis of the challenge presented by street values to multicultural initiatives.

**THE URBAN SETTING**

Urban schools are the battleground of a culture war. Traditional societal values are pitted against street values and are being beaten badly. Not only are schools unable to contravene street values, they actually adopt and promulgate many of them. Elsewhere we have described 14 values that constitute unemployment training and by which urban schools systematically predispose graduates as well as dropouts to a life of unemployment and nonparticipation (Haberman, 1997).

Street values do not represent the diverse, minority culture groups that comprise urban communities any more than they represent the traditional American values promulgated in public schools. Being a member of a particular culture group is a source of strength and provides a platform for living a life of high self-esteem and self realization. Living by street values portends a life of poverty, poor health, and antisocial behavior.

Before urban schools can become more multicultural, they must first become effective in resisting street values which, like other viruses, are carried into school each day by infected children. At present, students control the urban school’s agenda by making educators spend most of their time and energy reacting to street values rather than proactively implementing the stated curriculum. Responding to street values is the school’s primary business because maintaining a safe environment is a prerequisite for learning. But street values ultimately coalesce into an integrated behavior pattern that “works” for youngsters in urban schools.
For example, one street value is that personal relationships are determined by “who has the power to hurt you.” This supports the tacit but ever-present threat of violence. One way students demonstrate this power value in school is by manifesting a “make me” attitude. This street value, which defines all interactions and relationships on the basis of power, forms the basis for the school game in which it becomes the job of the teachers to force students to learn and the role of the students to resist by functioning as observers rather than participants. Once the game is in progress, school authorities respond with more and more rules and attempts at greater coercion; students respond with noncompliance. This leads to even more complex rules which in turn engender more sophisticated forms of student resistance and detachment. The net effect is that urban students who have assimilated this street value do as little as possible, indeed nothing more than show up, and finesse the schools into legitimizing this “activity” with passing grades. The technical term for this exchange in which students are passed for merely showing up and not being disruptive is “the deal” and has been carefully documented (Payne, 1984).

Enter all those interested in restructuring or reform, including advocates for multicultural curriculum. Unfortunately, making school curriculum more multicultural will not necessarily decrease the power of street values. The communal and face-to-face values that characterize the minority cultures in our cities have been just as ineffective at overcoming the power of street values as the traditional associational values taught in public schools. (The Black Muslim community is a notable exception to this pattern and actually does contravene some street values.) Scenes of distraught family members and ministers sitting in courts, hospitals, and funeral parlors and wondering how they lost their children are just as well documented as those of educators expressing failure at turning their students on to learning or keeping them in school.

STREET VALUES AND MULTICULTURALISM

The goal of overcoming street values must be separated from the goal of making schools more multicultural. The former deals with issues such as whether or not schools should use metal detectors; the latter deals with teaching and learning about self-identity, enhancing community cultures, and functioning effectively in American society. Making the school curriculum more multicultural will not necessarily decrease violence, dropout rates, or gang activity. These are not valid criteria for initiating or judging the effects of multicultural curriculum. Greater multiculturalism in school programs has the potential for providing students with (a) powerful ideas for how to live successfully in the general American society, (b) useful skills for succeeding in the world of work, (c) understanding various culture groups, (d) gaining identity and strength from participating in one’s own culture group, and (e) learning ways to contribute to greater equity and opportunity for all individuals and groups.

Some teachers offer such a curriculum by engaging, motivating, and interesting their students in ways that actively involve them and make them responsible for their learning. This leads to higher achievement in traditional school subjects. More importantly, it also leads students to demonstrate high level skills for solving real life problems—even how to resist street values in some cases. We designate such teachers “stars” using the following criteria: they work in districts serving a majority of students in poverty; their classes surpass the average achievement level of their building; they are identified by other teachers, their principals, students’ parents, outside observers, and themselves as superior or excellent. We estimate that even the most chaotic systems have as many as 8 percent of the teachers who meet these criteria (Haberman, 1995b).

Whether or not having a multicultural curriculum can overcome street values or merely provides a better education for youngsters who would resist street values anyway is a question in need of substantial future study. What we can be sure of is that multicultural curricula focus...
students on their current lives by studying real world problems rather than preparing them only for living later on in the best of all nonexistent worlds. In a society with the stated goals of equal opportunity and the enhancement of all culture groups, multicultural curriculum becomes a fundamental mission of public education.

Officially approved school-board positions adopting multiculturalism as a top priority are not typically found in small town or suburban school districts. “Can we all learn to live together?” is not a mission given schools in advantaged communities or in communities in which people expect societal institutions (i.e. government, the criminal justice system, health care, education) to function in their interest and actually meet their needs. Typically, multicultural mission statements are adopted in the 120 major urban districts that serve 7 million students in poverty and in which a majority of students are from diverse minority backgrounds. Consider the following statement of definition:

Multicultural education is a process built on respect and appreciation of cultural diversity. Central to this process is gaining understanding of the cultures of the world and incorporating these insights into all areas of the curriculum and school life with a particular emphasis on those cultures represented in our school community. Growing from these insights is a respect for all cultures and commitment to creating equitable relationships between men and women, among people of different ethnic backgrounds, and for all categories of people. Viewed in this manner multicultural education builds respect, self-esteem, and appreciation of others and provides students with the tools for building a just and equitable society.

(Milwaukee Public Schools, 1995)

The statement goes on to spell out an exhaustive list of goals for students that include an extensive understanding of American society derived from anthropological, historical, and economic concepts: sophisticated communication concepts and skills: the willingness and ability to self-reflect and change oneself; the causes and cures of a low self-concept; and in-depth knowledge of the causes of all forms of societal inequity as well as the proclivity and skills for making the world a better place.

THE KNOWLEDGE BASE

Over the last 40 years we (Haberman and colleagues) have had the opportunity to develop, evaluate, and offer more teacher education programs preparing more teachers than anyone in the history of American teacher education. These programs have been notable failures if we use criteria such as the following: Did these models become institutionalized in universities after external funding was discontinued? Did the graduates remain as teachers in poverty schools longer than 3 years? Within each of these models, however, we have been able to identify program elements that do predict which candidates will be effective with children in poverty, who will remain as classroom teachers, what is the ideology of such teachers, and how are they selected and trained. In our current Metropolitan Multicultural Teacher Education Program (which is now replicated in several cities), we have a 7-year record of 97.5 percent retention of a teacher population that is 75 percent minority in the Milwaukee Public Schools.

In considering what we know about our teachers that predisposes them to offer multicultural programs as an integral part of their teaching, we have identified the nature of their knowledge base. Following are some of the essential elements of this knowledge base.

Self-knowledge—a thorough understanding of one’s own cultural roots and group affiliations. An individual who says, “I’m not a member of any culture group, I’m just an American,” is not sufficiently grounded to teach a multicultural curriculum. Teachers encourage students to search for more knowledge about their own and classmates’ roots by sharing their own.
Self-acceptance—a high level of self-esteem derived from knowing one’s roots. Nobodies do not make somebodies. It takes somebodies to make somebodies. Teachers foster self-confidence and pride of group identity by demonstrating a confident acceptance of their own.

Relationship skills—the ability to work with diverse children and adults who are different from oneself in ways that these others perceive as respectful and caring. The teacher shows “we can all live together” by treating all groups as equally fine.

Community knowledge—a knowledge of the cultural heritages of the children and their families. Teachers who make home visits and have continuing experiences in the community’s churches, stores, businesses, and parks are able to offer a multicultural curriculum that derives from the specific life experiences of the children in their classes.

Empathy—a deep and abiding sensitivity and appreciation to the ways in which children and their families perceive, understand, and explain their world. The teacher truly understands what parents in particular culture groups may want for their children without lowering standards and expectations.

Cultural human development—a understanding of how the local community influences development. The teacher knows more than what is supposedly universal for all 7-year-olds or all 13-year-olds. What does it mean for a toddler, child, preadolescent, or adolescent who is of a particular language, racial, cultural, or economic group to “grow up” in this community?

Cultural conflicts—an understanding of the discrepancies between the values of the local community groups and the traditional American values espoused in schools. The teacher expects, prepares for, and deals with issues that arise from differences in religion, gender roles, and values.

Relevant curriculum—a knowledge of connections that can be made between general societal values and those of the culture groups in the community, and the skills needed to implement this knowledge. The teacher connects specific content goals to specific uses in the students’ lives.

Generating sustained effort—a knowledge and set of implementation skills that will engage youngsters from this community to persist with schoolwork. The teacher’s daily instruction is organized around and rewards effort rather than perceived ability.

Coping with violence—skills for preventing and de-escalating violence and the potential for violence. How do I work in and help students succeed in an environment where violence is a constant fact of life? The teacher demonstrates forms of conflict resolution based on criteria other than power.

Self-analysis—a capacity for reflection and change. How can I use my experiences to continue to learn, grow, and change? Teachers engage in systematic self-reflection. They develop and implement plans for professional development that impact on their classrooms.

Functioning in chaos—an ability to understand and the skills to cope with a disorganized environment. Urban school systems reflect the unstable, dysfunctional nature of their communities. Teachers who remain effective in such environments know and can implement behaviors that enable them to function effectively in spite of the irrationality of their school bureaucracies.

HOW DO TEACHERS LEARN THESE THINGS?

Teachers who can work with children in poverty in multicultural ways are neither born nor made; they develop as they integrate significant life experiences. A consideration of the elements of the knowledge base described above reveals that they are not forms of knowledge found in genes or gained in university courses. How then are these forms of knowledge developed and learned?

Star teachers of children in poverty offer some interesting perceptions and beliefs regarding how they got where they are in their development as teachers. Telling their stories, they state
some things directly about their own development. In other cases they offer explanations after we ask them to explain things we have observed them doing in their teaching. The discussion that follows describes most, not all, of how they learned to teach. While the content of these learnings has changed, the procedures for learning them has remained fairly constant over the last 4 decades in which we have witnessed instruction and listened to teachers in urban schools across the nation.

Almost everything star teachers do that they regard as important is something they believe they learned on the job after they started teaching. When asked, “Where did you learn that?” about a practice or idea, they almost never attribute their learning to a university course, experience, or faculty. Teachers’ preferred way of learning is to observe colleagues whom they regard as credible because they are successful with similar students in the same school system. Their focus is on craft knowledge. They are the ultimate pragmatists. Their test for knowledge is that they have seen it “work.”

Having a credible teacher mentor actively coach them in their own classroom is the way star teachers prefer to practice and learn more effective procedures and make them their own. “Credible” mentors are teachers observed actually performing what they advise. Being part of an effective teacher team is also a powerful influence on teaching practice. Teaming is so influential that even when the team is functioning negatively it may continue to dominate their thinking and learning. Since teacher teams typically deal with the same students, teachers are especially sensitive to other teachers’ practices that may be generating different student behaviors.

The perceived need to learn more subject matter is an unusual and minor influence on development of teachers. Practicing teachers rarely if ever attribute their students’ lack of interest or achievement to their “inadequate” content knowledge. They strongly reject the contention that children in poverty are not learning more because their teachers do not know enough.

Developing more knowledge of teaching methods is regarded as an unimportant or easily met need. Teachers do not believe they need more workshops on teaching methods. They do seek more specific ways of making any method meet the particular needs of their students. They seek solutions to their perceived problems, not more subject matter content or teaching methodologies. Teachers regard workshops as useful if they come away with (a) specific strategies they can use to resolve their problems or (b) specific new materials or resources they can use in their classrooms. Again, such workshops must be offered by practicing teachers they regard as credible.

Networking with other teachers trying to resolve similar problems in the same school system seems to further teacher development and combat burnout. Some of the more influential activities frequently relate to methods of coping with system-imposed policies regarding new programs, testing, grade level requirements, recordkeeping, discipline, and school rules. The body of knowledge teachers learn in order to cope with such school mandates and other required conditions of employment constitutes a major portion of the knowledge they develop in the course of their careers. This essential knowledge for functioning in chaotic systems is shared by classroom teachers but is ignored in the professional literature. If it is noted it is deprecated as situation-specific information, or craft know-how, and not considered “professional knowledge.”

Teacher practice is not seriously affected by theory or research. Rival explanations of human intelligence or summaries of phonics versus whole language research is not a determinant of how they plan or make instructional decisions. Activities that impact on teacher development in unimportant ways, if at all, include reading reports of research findings; listening to experts who are not regarded as credible because they are not teaching children in poverty; and reading analyses of “hot” topics at particular times, such as bilingual versus English-only instruction, or the pros and cons of tracking.

Substantial teacher development comes from using the lives of children as a rich source of study. Star teachers are constantly involved in learning more about their children, their families
and communities, and what it means to grow up in particular settings. By using children’s life experiences as a fundamental part of the classroom program, teachers continually learn more about children and community cultures. Teachers attribute almost all they know about child development to what they have learned about the lives of their students.

Much teacher development comes from the process of sharing their own interests, experiences, and talents with their students. The children, in effect, reward and shape their teachers by accepting and affirming what they share. The teachers, in turn, see the need for children to share their own backgrounds.

A great source of teacher development occurs by serendipity. Urban schools “try” almost everything. While projects are not systematically offered or evaluated, they abound. Inevitably this plethora of projects (“projectitis”) has unintended consequences and unforeseen impact. Urban teachers and students who live with these erratic initiatives, reforms, programs, and models have daily encounters with unplanned events. In addition to developing general coping principles (e.g. “Just wait a year and it will go away”), teachers learn much from the specifics of each initiative. Working in chaotic systems—and urban school systems are examples of chaos theory in action—is a powerful learning opportunity. Teachers in large urban settings become experts in discerning what to ignore, what to cope with, and what to learn from.

The most important source of teacher development is their ideology; that is, what they believe about the nature of teaching and learning, the nature of development, and the nature of the setting. They bring this ideology with them, but it is imbedded in a casing of prejudices, biases, preferences, beliefs, values, and perceptions. As they begin and move through their teaching experiences, some resist any new input. Such teachers have one year of experience 30 times. Others seek to reconcile their ideology with their experiences and have 30 years of growth—much of it on a painfully steep learning curve.

But the teachers’ experiences do not automatically lead to positive growth. We know that many teachers use their teaching experiences to solidify and rationalize their prejudices (Sleeter, 1992). Other teachers use their direct experiences to become increasingly supportive of children. Teaching is a process in which selective perception enhances what the teacher believes at the start. The ideology with which teachers begin their teaching has been shown to determine whether or not they will use their subsequent teaching experience to become more positive or more negative (Haberman & Post, 1992).

There are, of course, other ways in which teachers learn. Since Haberman started preparing teachers for children in poverty in the late 1950s, what teachers need to know has changed appreciably, but how teachers learn has not. Effective, growing teachers continue to use the same fundamental learning modes as practitioners of other human service crafts.

**WHO SHOULD PREPARE FOR MULTICULTURAL TEACHING**

In the programs we offer, we begin with college graduates (from all fields) who have had in-depth experiences with children and youth. They have initial summer experiences teaching children so that we can verify our selection interviews. In effect, how they actually interrelate with children in poverty is their final selection. They are hired as teachers by the Milwaukee Public Schools each September. The process by which they are prepared includes careful mentoring (one full-time mentor for each four teachers) and weekly classes. The mentors are star urban teachers as are the resource people who lead their weekly meetings. The role of university faculty, health and human service professionals, business consultants, parents, computer experts, and community resource people is to supplement the knowledge base of the practitioners who serve as mentors and resource people.

Not surprisingly, the “best and the brightest” teachers of children in poverty who complete this
program at not young White females from small towns or suburbs with grades of A in student teaching and high grade point averages (GPAs) who "always wanted to teach." The profile of the "best and the brightest" for culturally diverse children in urban poverty includes demographic as well as personal attributes such as the following:

- Did not decide to teach until after graduation from college.
- Tried (and succeeded) at several jobs or careers. Is between 30 and 50 years of age.
- Attended an urban high school.
- Has raised several children, is a parent, or has had close, in-depth, meaningful relations with children and youth.
- Currently lives in the city and plans to continue to do so.
- Is preparing for a teaching position in an urban school system.
- Doesn't believe "kids are kids" but comprehends and appreciates how cultural forces impact human development.
- Has had personal and continuing experiences with violence and of living "normally" in a violent community and city.
- Has majored in just about anything at the university.
- May or may not have an above-average grade point average.
- Expects to visit the homes of the children.
- Has some awareness of or personal experience with a range of health and human services available in the urban area.
- Expects that the school bureaucracy will be irrational and intrusive.
- Is likely not to be of Euro-American background but a person of color.
- Is likely to be sensitive to, aware of, and working on one's own racism, sexism, classism, or other prejudices.

These are some of the attributes that, taken together, provide a thumbnail sketch. Taken singly, each has no predictive validity. They characterize but do not explain teaching success. They are cited here merely to provide the real-world alternative to "the best and the brightest" stereotype that emphasizes high GPA college youth and continues to emanate from blue-ribbon committees, national panels, private foundations, the Office of Education, and other fantasy factories. High GPA has nothing to do with teaching children in poverty effectively or predicting who will remain in teaching. Indeed, we have much evidence that using high GPA to recruit and select will identify quitters and failures (Corwin, 1973).

In our current Milwaukee program (which has been replicated seven times in 7 years), we prepare individuals who share most if not all of the attributes cited above. They also share the experience of living in poverty for substantial periods themselves. Indeed, many of them are currently living in poverty and need not recollect former periods of their lives. In many ways these new teachers are "at risk" themselves because they live in communities characterized by violence. Since they are all carefully selected as having a commitment to the behaviors and ideology that matches those of star urban teachers, we know they will be successful. What we did not anticipate were the effects of their own low economic level on their lives and the stress this creates during their first year.

For example, we have had resident teachers die. They have also experienced the following: the death of a child; critical, life-threatening injuries to members of their immediate family; violence at home (either abuse from a spouse or child abuse); bankruptcy; forced moving, that is, the need to find a new residence for the family; inability to secure an affordable home or car insurance; serious illnesses requiring unforeseen surgery or rehabilitation; chemical or drug dependency; serious and continuing transportation problems; marital problems of all types and severity; child custody problems; lawsuits related to a variety of out-of-school issues for which the teacher could
not afford counsel; poor nutrition, exercise, and sleep habits; no preventive medicine for themselves or their families; mental and emotional problems, treated and untreated; and fear of deportation as illegal aliens.

We have been impressed, “fooled” would be more accurate, by the ability of our resident teachers to both learn from and overcome their life experiences at the same time they were learning to teach in extremely demanding, urban poverty schools. The lesson we have learned is that carefully selected “best and brightest” (i.e., our definition) are individuals who are themselves frequently in poverty, close to poverty, or grew up in poverty. They are sensitive to what it means for a child to have to sneak to school early to avoid being beaten up by a gang, and why it is important for schools to have unlocked doors and serve breakfast. They not only show great understanding for the children but for the parents or caregivers.

At the same time such teachers follow through and insist upon parents and caregivers performing their responsibilities. While they appreciate and empathize with their students’ stressful life conditions, they expect students to work at being successful in school. This profile has not precluded us from finding some teacher candidates from advantaged backgrounds. Our experience has been that one out of ten full-time, undergraduate students under 25 years of age, in full-time preservice teacher education programs, can pass our selection procedures.

One focus of our program is on preparing the interprofessional practitioner. This is no small feat. Anyone who has ever offered a teacher education program for children in poverty knows that it is typical for student teachers, beginning interns, and first-year resident teachers to be fearful: they fixate on the question, “Will I be able to control the children and manage what happens in my class.” To shift the focus off themselves and onto the total wellness of children frequently living in debilitating life conditions, once again, requires careful, appropriate selection of teacher candidates. The assumption that training alone can be sufficiently powerful to transform the immature and fearful into interprofessional practitioners is contrary to our experience. Teachers cannot themselves perform the range of health and human services their children need, but they can learn to identify conditions (such as abuse) and even more, expect and anticipate the needs of their children for services. Teachers can also be taught to help their children’s families to make the connections they will need to get services they do not know they need, do not know are available, or do not know who to contact to access them. In poverty schools the client is not only the child but the child’s family.

CAREFUL SELECTION AS A NECESSARY CONDITION

No school can be better than its teachers. And the surest and best way to improve the schooling for children and youth in poverty is to provide them with better teachers. The strategy for doing this is not mysterious. The premise is simple: Selection is more important than training. We have elsewhere described the attributes that predict success in urban poverty schools and the ones that may be identified in interviews (Haberman, 1995a).

Training is useful only for those with appropriate predispositions. The reason for this is that the functions performed by effective urban teachers are undergirded by a clear ideology derived from life experiences. Such teachers not only perform functions that quitters and burnouts do not, they also know why they do what they do. They have a coherent vision. It is a humane, respectful, caring, and nonviolent form of “gentle teaching” that we have described elsewhere (Haberman, 1994). Our point here is that star teachers’ behaviors and the ideology that undergirds their behaviors cannot be unwrapped. They are of a piece.

Nor can this ideology be taught in traditional programs of teacher preparation. Writing a term paper on Piaget’s concept of conservation or learning the seven steps in direct instruction will not provide neophytes with the ideology or skills of star teachers. This ideology and craft is open to
development only in those predisposed to selectively perceive from their experiences in positive ways. What can be taught are effective teaching behaviors that are built on an already functioning belief system. Like the ideology, the teaching behaviors are not typically learned in coursework or in student teaching but on the job, with mentoring by a star teacher/coach, a support network, and some specific workshops and classes.

Reviews of college student learning and teaching provide overwhelming evidence that what students expect and value will determine what they will derive from their teacher education (Pintrich, 1990). Reviews of the relationship between development and learning indicate that what is learned is determined by the students’ developmental stage. They must have attained an adult stage of development to benefit from teacher training (Sprinthall et al., 1996). But knowing that college students’ learning is controlled by their values and whether or not they have reached adulthood still has not changed the way they are selected into traditional programs of teacher education. GPA and written test scores still control the admission of late adolescents into traditional preparation programs (Haberman, 1996).

**IMPLICATIONS FOR THE LOCUS OF PROGRAMS**

We have earlier discussed the ways in which teachers learn most effectively. Each of these ways is incorporated into an effective training program. Teachers-to-be should be actually engaged in responsible teaching; be able to observe star teachers in action; have a mentor who is a star teacher coaching them; be part of a team; participate in a network coping with a highly bureaucratized system; be students of their communities; and continually be faced with problems that cause them to reshape their ideology. In addition, the training is most effective when it is offered in the worst schools under the worst conditions of work.

Traditional teacher education and state certification agencies make the reverse assumption. They create professional development centers engaged in best practices and then certify graduates universally. The naive assumption is that graduates will be able to function in the worst school situations because they have observed good practices.

We make a more realistic assumption: Carefully selected and well prepared teachers who are educated to function in the worst situations will be able to function in poverty schools and other schools as well. They will not quit if they are “forced” to teach smaller classes, have fewer inclusion students, or receive adequate supplies and materials. Neither will they be shocked if every student has a seat and enough textbooks.

Since states assume license holders can teach all students in all situations, our philosophy of training in and for the worst situations is also the ethical position. In these “worst” training sites we have always found star teachers who can demonstrate that their ideology works (Haberman, 1995b). The fact that star teachers can actually function effectively in such “intolerable” situations has great impact on neophytes. Beginners are much more impressed by greatness operating in the real world than by observing best practices in a situation they will never again find. Our approach is to also work toward zero transfer, that is, learning to teach is most powerful when it is under the actual conditions in which one will serve. This means that ideal preparation would occur in the very school and community where one will remain as a teacher.

**CONCLUSION**

We believe that getting better teachers is the best engine for driving school reform in poverty schools. The success of our program over the last 7 years tells us that implementing multicultural programs requires melding an extensive knowledge base with teacher ideology. The knowledge
base can be identified in the work of star urban teachers, and neophytes with the ideology can be selected and then trained.

Emphasizing the work of star teachers means that the role of university education faculty with specific expertise must be reconceptualized from that of primary educator to resource person. We argue that the knowledge base is learned best in particular, specific school sites in the worst urban poverty schools and only those predisposed to learn what star teachers already know will accept and internalize the training. We make the issue of transfer of learning moot by preparing teachers to work in the very schools and communities where they will continue to teach after certification. After careful selection, training does have important value, provided such training emphasizes being mentored while on the job as a fully accountable teacher.

Our work has also identified neophytes who are “best and brightest” in ways not recognized by traditional teacher education programs. Successful candidates are over 30 years of age, frequently minorities, and have life experiences in urban areas. We have also shown that some European Americans may also demonstrate the predispositions of star teachers and are able to function effectively in poverty schools.

We hold several undergirding beliefs as guiding principals that need to be developed elsewhere to complement our argument. University faculty should be involved in but not in control of the preparation of teachers for children in poverty. Research and theory in the preparation of urban teachers must complement teacher ideology and the practices of star urban teachers. The university dedicated to accepting any candidate’s belief system in a context of academic freedom is not the ideal place for selecting future teachers with an appropriate ideology. The process of mentoring on the job is extremely more powerful training than taking classes or going through traditional forms of laboratory experiences. Finally, and of greatest importance, is our contention that all teacher education programs for children in poverty must require candidates to demonstrate that the children they teach are actually learning important things (e.g. multicultural concepts) before granting certification.

Commentaries
Over the past decade, The New Teacher Project has been engaged in the processes of recruiting, selecting, training, and hiring new teachers for placement in high-need urban school districts across the country. We have started over 55 initiatives and programs in 26 states and have succeeded in recruiting, training, placing, and/or certifying over 28,000 teachers to work in under-performing schools across the nation. In our work, we have learned several things. First, there is an abundance of people who truly want to work in urban districts and who are driven by the idea of having an impact on public education by being classroom teachers. Both traditionally trained or certified teachers and young and mid-career professionals can be compelled to work in challenging environments if the right messages are sent, rigorous standards are held to in the selection of candidates, and high quality training and induction are in place to orient the new teachers to their classroom environments.

THE WORK WE DO

In our alternate route programs, we aggressively recruit career changers to make the switch into education. We start with very stark, but compelling recruitment campaigns that make clear the social injustices in our public education system. We utilize a call to action surrounding the need for outstanding community members to make the commitment to changing life outcomes for poor and minority youth. Our recruitment campaigns across the country have been incredibly successful in attracting a large pool of potential teaching applicants, with the average applicant to vacancy ratio in our programs being 12:1.

Once we attract this pool of applicants we implement a rigorous screening process to cull the best candidates from the pool. We eliminate between 30 to 40 percent of the pool based on a paper screen of their cover letter, résumé, writing sample, and transcripts. The remaining 60–70 percent of applicants are invited to a day-long interview. During the interview day we assess the candidates through a variety of lenses. First, the candidates conduct a mock lesson in which they are required to state the objective of the lesson and grade level of the instruction and then deliver a five-minute lesson to meet that objective. As career changers, we do not expect them to be able to teach a full lesson, but we are looking for their capacity to organize their activity around a clear objective. Second, the candidates self-facilitate a group discussion around a reading chosen for its
focus on student achievement or the achievement gap in urban districts. We also require candidates to respond to a writing prompt to gauge their ability to think critically and write compellingly in a short amount of time. Lastly, we conduct a one-on-one interview with candidates where we ask them specific questions about the interview day, their application and work histories, and additional questions that probe for the attributes that we believe are necessary in any successful urban school teacher. Our selection process is intense, highly competitive, and results in very few of the candidates ultimately being chosen for participation in the program.

Once a candidate is accepted into the program, we enroll him or her in a six- to eight-week intensive pre-service training. The training largely takes place in summer school classrooms in the hiring district in order to give the teachers first-hand experience with students. We inculcate the teachers with the belief that they, personally, are responsible for ensuring the achievement of every child in their classroom, no matter the external influences at play. We train teachers that understanding the whole child, including community/environment/home life, is a crucial aspect in order to see the child reach his or her fullest academic potential, but we send and reinforce the explicit message that the teacher still has personal responsibility for the outcomes that are achieved in his or her classroom.

As the candidates continue through the pre-service training, we facilitate their hiring and placement in the district and ensure that they are enrolled in a state-approved certification or credentialing program in order to comply with NCLB “highly qualified” provisions. Our candidates are selected for their extremely strong content knowledge in their subject area and rarely have problems passing the required content exams. They are enrolled in certification programs in order to learn the theory, methodology, and pedagogy involved in being a successful teacher.

WORKING WITH UNIVERSITY-BASED ALTERNATE CERTIFICATION PROGRAMS

Our experiences with more than two dozen institutions of higher education providing programs to our participants have been mixed. With few exceptions, we have found the programs to be cumbersome, expensive, not academically rigorous, and mostly irrelevant to the day-to-day professional lives of our “Teaching Fellows.” Feedback from our Fellows indicate that university-based programs overall do not take into account who they are as learners, specifically (1) that many are working professionals with a significant amount of content knowledge and work experience; (2) they are in high-need urban classroom settings; and (3) that they are teaching full-time concurrent with learning how to teach. In other words, the typical Fellow’s experiences are very different from 18-year-old undergraduates who are entering schools of education with limited content knowledge and work experience and who typically do not commence the field placement portion of their program until the latter part of their four- (or five-) year degree program.

Yet, most university-based alternate certification programs geared toward career changers simply offer the same program of study delivered to undergraduates, with the course times changed from the middle of the day to the evenings. Our Fellows report that their courses are often developed and taught by professors who appear far removed from the current realities and demands of teaching in urban classrooms. The content (syllabi, including text/reading selections) of the courses do not take into account that Fellows are likely to be responsible for teaching students who are two to four grade levels below where they should be in terms of reading, writing, and mathematical proficiency. Given the
challenges they and their students face, Fellows understandably expect coursework that accommodates their need for concrete, effective instructional strategies and interventions that they can apply immediately in the classroom to accelerate their students’ academic growth and success. Finally, Fellows report that the overall rigor and expectations for coursework, academic engagement, and discussion are extremely low.

Despite the fact that our programs across the country are a pipeline for a significant number of shortage subject area teachers, we have found little interest from colleges and universities in working to adapt or modify their certification programs to better serve our Fellows. Fellows continue to be required to take generalized courses (with a physics teacher sitting next to a kindergarten teacher) in which neither of them is getting real value out of the coursework content or experience. Education schools and divisions, often tied by state regulations around what programs must look like, feel compelled to or choose to adhere to a traditional structure and delivery of the mandated program of study.

We have also found through our experiences bringing career changers into the teaching profession the limits of how education schools and divisions often theorize and view the work of teaching and teacher education. In the Boyle-Baise and McIntyre essay, for example, we are offered two competing theories of teacher preparation: Community School Models versus Professional Development Schools. Our organizational experiences suggest this to be a false dichotomy. While researchers have not fully settled the question of what teacher qualities predict student achievement, there is strong consensus that both content knowledge and verbal ability are linked to a teacher’s ability to increase student achievement; therefore, a core part of our selection model screens for people with strong verbal abilities and deep content knowledge in a subject area. In addition, because we are seeking people willing to take a tremendous risk in changing careers into what is well known as an extremely difficult profession, we typically recruit locally, seeking people who have a deep commitment to the community in which they will be teaching. In our experience it is not an either/or but our starting premise that Fellows must have both significant content knowledge and a strong community orientation with requisite cultural sensitivity in order to maximize the achievement of every child.

PRACTITIONER TEACHER PROGRAMS: MEETING THE NEEDS OF BEGINNING TEACHERS

It was not TNTP’s intention to go into the teacher certification business. Our original program design entailed finding high-quality university partners who would certify and prepare our alternate route candidates. Our initial core competencies were teacher recruitment, selection and pre-service training. We felt compelled, however, to move into the certification arena by the overwhelming feedback from our Teaching Fellows, who told us that their university-based alternate certification programs were not meeting their needs. In 2002 we launched our first certification program, called the Practitioner Teacher Program, in Louisiana. At the heart of this alternate certification program lies the Teaching for Results content seminar series, a design and delivery approach that focuses on meeting the needs of alternate route beginning teachers.

Standards-focused, content-specific pedagogy

In 2002, we developed and began implementing the Teaching for Results (TfR) content seminar series to support new teacher development in content-specific pedagogy with a
deliberate focus on teaching for student achievement. TNTP commissioned practitioners and scholars within specific fields to develop a series of seminars ranging from Elementary Literacy to Secondary Science, in which new teachers could hone their skills in the design and delivery of high-quality, standards-based instruction to their students.²

The conceptual framework for the TfR series blends a backwards design instructional approach, content-specific pedagogy, and action research to provide continuous, ongoing support and professional development for participants. The beginning of the series coincides with the first months of school so teachers spend those first sessions drilling down into state- or district-specified grade and content standards, identifying critical priority standards, and then choosing, modifying, or creating assessments that demonstrate student proficiency in those priority standards. Once new teachers are grounded in the “what” of the standards, they move into the “how”—in each seminar session they tackle a new chunk of student standards and they choose, model, discuss and critique which instructional approaches are most appropriate for those priority standards; these choices are always rooted in their understanding of what a valid assessment of that standard would look like. Finally, as new teacher proficiency in selecting assessments and instructional choices grows, they bring their own practice into the session by presenting lessons they design or adapt and share student work to critically examine with the group whether the lessons resulted in achievement of or student progress towards the standard.

The series is specifically focused on working in high-need urban schools, closing the achievement gap and working with learners who are often two to three grade levels behind their peers. Seminar participants also receive support in classroom management that is specific to the subject and the grade level they teach. This dual approach—the art of teaching, coupled with subject-specific classroom management strategies—is what makes Teaching for Results different from other new teacher support programs.

Content seminar leaders: academic practitioners

Content Seminar Leaders (CSLs) are experienced teachers hired by The New Teacher Project to formally train, support, and facilitate the content seminar series for our beginning teachers. In keeping with our belief that connection to the community is a critical element of effective professional development for teachers, CSLs are deliberately recruited from within the districts and communities in which our teachers work. CSLs are responsible for implementing the TfR curriculum and planning two seminar sessions per month. During these sessions, they model high-impact instructional strategies and engage seminar participants in reflective practice, including individual and collective analysis of participants’ lesson plans, assessments, and student work. CSLs are also available to teachers outside the seminar sessions through phone and email. CSLs formally evaluate participants’ progress during the year and help enforce programmatic requirements by keeping seminar meeting attendance records and monitoring assignments.

All CSLs participate in an intensive five-day training based on “strategic design,” a framework to help new teachers align standards-based assessment and instruction with unit and lesson planning. During the training, CSLs discuss and practice strategies to help seminar participants do the following: prioritize content standards; identify and choose from among a variety of assessment strategies; make appropriate instructional choices based on content and assessment; and benchmark student progress toward standards by analyzing student work and using that work to inform their teaching practice.

Content Seminar Leaders provide a critical link between new teachers’ pedagogical development and their classroom-based experiences. Therefore, TNTP carefully evaluates
the effectiveness of these leaders through regularly-solicited informal feedback from seminar participants, ongoing CSL observations by TNTP staff, and mid- and end-of-year written assessments of their performance and usefulness of the seminars by seminar participants.

School site-based input on certification decisions
At the end of their first year of teaching, in addition to successfully passing their content seminar series, completing a portfolio assessment that complies with state standards, and passing state-mandated pedagogical and subject-specific standardized exams, participants must also receive the recommendation of their principal or site-based administrator in order to gain certification. Our program differs from many university-based alternate certification programs in that it involves the employment manager in the certification decision. Typically, beginning teachers are certified based on coursework completion (what we call “seat time”) and classroom observations. Unfortunately, observations provide only a snapshot of teaching performance, often only highlighting engagement or lack of engagement in students; they do not provide a comprehensive view of the teacher’s capacity to move all of his or her students toward academic mastery of content standards. Our experiences suggest that input from a school leader or principal, who can assess teacher performance as compared to grade level peers and who is accountable for the overall impact of his/her teaching staff, is instrumental in making an informed program decision when it comes to teacher certification.

Response from participants
Of participants who completed our PTP certification programs, TNTP found:

- Eighty-four percent agree that the TfR content seminar series was relevant to their experiences in the classroom (in comparison, in TNTP’s surveys of new teachers in university-based alternate certification programs, 62 percent agree that their university coursework was relevant to their teaching needs).
- Sixty-eight percent report that the PTP improved their classroom management skills.
- Seventy-nine percent report that the PTP improved their instructional planning skills.
- Seventy-four percent report that the PTP improved their student assessment skills.
- Ninety-six percent agree that their Content Seminar Leader helped them become a more effective teacher.
- Eighty-four percent agree that they are satisfied with the TfR content seminars overall (as compared to new teachers in university-based alternate certification programs, of whom 67 percent were satisfied with their university, overall).

Conclusion
Our experiences to date in developing and running our PTP alternate certification programs underscore our belief that the most effective way to prepare teachers for urban classroom settings entails recruiting and selecting candidates with substantive content knowledge and a keen commitment to working in high-need communities, and then ensuring they are prepared and certified through programs that are highly responsive to their unique pathway into high-need, urban school settings. The learning curve during
the first years of classroom teaching is precipitous, and the stakes for urban school districts are enormous. We will continue to challenge our university-based certification program partners to meet these demands or provide alternatives that can; it is our hope that certification providers will align their programs to the very real needs of new teachers and provide rigorous, relevant programs like the PTP.

NOTES

2 The series was designed with financial support from Washington Mutual Bank.
21 Settings for teacher education

Challenges in creating a stronger research base

Sharon P. Robinson
American Association of Colleges for Teacher Education

Why does the question of settings for teacher education matter? One could argue that—if teacher education settings are regarded as an “input” or “process” dimension—then attending to this issue runs counter to the focus on teacher performance. But for the same reason, this issue may be more relevant than ever. As formats and delivery modes through which teacher preparation takes place continue to multiply, learning how various preparation settings influence growth and professional development of teachers may become critical to sorting out what is valuable and what is ineffective in the expanding array of teacher education models. If we envision an investigative framework that includes the major variants in teacher education settings tied to systematic data collection and analysis of correlation with student learning results, the resulting research could contribute an absolutely essential piece in linking professional preparation methods with measures of student success.

So, as we look at previous studies and commentaries on teacher education settings, we need to look at these with an eye to:

- understanding whether and how the mode of preparation influences how teachers practice;
- learning how to identify professional development needs for teachers and other professionals currently in practice; and
- making decisions about how to design and implement teacher preparation settings in order to achieve the best results for students and their teachers.

There is an important link between the settings in which professional educators are prepared and the overall coherence of their preparation programs. Clift and Brady (2005) note that most research on teacher education courses and field settings is done without considering overall program coherence, making it difficult to determine in isolation the effectiveness of a particular course or field experience. Moreover, Darling-Hammond and Hammerness (2005), argue that programs lacking in coherence and lacking in “a common conception of teaching and learning have been found to be relatively feeble change agents for affecting practice among new teachers.” While it is important to turn our attention specifically to the issue of professional preparation settings, it is equally important to link these studies back to comprehensive structure of the program.
Papers and artifacts present divergent views, not only on perspectives about teacher education settings but in how they even conceive the topic. Labaree (2004), for instance, observes that “teacher education” can mean preparing new teachers for the profession, or it can mean conducting research on the enterprise, or it can mean training superintendents and school leaders. Some of the variation in definitions reflects a breadth of roles and contexts for professional practice, some differences stem from the individual researcher, and some reflect the history of a not-yet-fully-formed professional teacher preparation enterprise that has grown from both primary/secondary and normal school roots. The conceptions of teacher education underlying these studies are not always stated by their authors, but they do surface in the nature of the discussions—for instance, the basic framework from which the teacher preparation enterprise is viewed. Some researchers write from a clear commitment to supporting equity for particular groups of students, and while this may be a common stance for most educators, it is not as explicitly addressed in other studies that direct more of their attention to structural or curricular aspects of teacher education. The commitment to equity may itself be grounded in larger conceptions of the role of teaching as a moral enterprise. Hansen (2001) describes how the conception of teaching as a job, an occupation, or a profession impacts the perceived ends of teaching and the terms by which the teaching activity is framed—a critical foundation for designing and selecting the settings in which expectations are conveyed to candidates and to new teachers.

Divergent views lead to different descriptors about teacher education and teaching. Authors who frame observations about settings for teacher education from a definitional or normative starting point offer criteria for determining successful teacher education. Zeichner and Conklin (this volume) suggest four critical components for exemplary preservice teacher education programs: (1) institutional context which considers the social and political context attributes important to the functioning of the programs; (2) the program level which looks at the how a program is organized and its goals; (3) the teacher educators and candidates in the program; and (4) the substance of the program which looks at coursework, field experiences, ways candidates are taught and the data that informs how candidates are taught. Haberman and Post (1998) suggest that indicators of effective settings to prepare the best teachers for culturally diverse children in urban poverty would take into account the connection between classroom placement for clinical experiences and candidates’ personal background and attributes.

Darling-Hammond (1999) addresses settings from the perspective that programs preparing successful teachers provide appropriate contexts for engaging several kinds of knowledge about learning such as what it means to learn different kinds of material for different purposes, how to support different kinds of learning with distinctive teaching strategies, and how to make judgments about which kinds of learning are most necessary in different contexts. In this frame of reference, successful teacher preparation settings would be those that best help candidates acquire knowledge and skills. This brings into the picture other aspects of the setting decision, i.e. adequate time for a complete preparation program, linking particular learning contexts relating to the nature of teaching knowledge being conveyed, extent and nature of candidate supervision, provision of pedagogical and subject matter coaching, and the candidate’s access to an extended practicum experience (Darling-Hammond, 1999).

The research field as a whole has yet to fully expand analysis of teacher education settings to develop a convincing case or effective methodology that grounds study of
successful teacher preparation in the performance of P-12 students. In particular, we need to connect varying perspectives on successful teacher preparation to academic standards that constitute the predominant structure for current education policy and practice at the P-12 level. Rarely do our studies probe connections between specific settings for teacher education, students’ work toward standards-based learning expectations, and capacity of teachers to support effective instruction with constructive feedback to students on their academic work products.

Cognitive development researchers argue that it is essential for teacher preparation to be “linked to actual experience in classrooms in assessing and interpreting the development of student competence” (National Research Council, 2001, p. 309). Designing the settings for this all-important link between teacher understanding and student learning is a critical contribution to teacher quality. It also requires that teacher educators develop a plan for expansion of their own professional knowledge in areas such as cognitive science and assessment at both student and candidate levels as a prerequisite to the program design work that shapes field and clinical experiences for teacher education.

Researchers’ perspectives also differ on rationales for decisions about teacher education settings. Authors of these papers reflect different starting points for basing significant decisions on the structure and design of settings in which candidates learn to teach. Seidl and Friend (2002) contend that White people need specific training in anti-racist behavior and attitudes to be successful teachers in urban settings. Others focus on the placement level for which teachers are being prepared as an important determinant. For example, Labaree (this volume) suggests that teacher education is very different—in substance, reputation, mission—for elementary teachers than for high school teachers. He points out that elite universities historically have seen themselves playing a different role than the education schools at regional state universities with the latter focused on preparing a large number of elementary school teachers—primarily women—and the former focused on preparing school administrators and a small number of high school teachers and on the production of educational research, primarily men.

Research approaches that focus on candidates’ needs appear to ground decisions about settings in the needs of (all or particular) teacher candidates (Seidl & Friend, 2002). This rationale implies that teacher education should attend to the individual needs of its own learners—in effect, should model learner-centered approaches of P-12 teaching practice. Another research perspective, the focus on school level (Labree, this volume), makes the school configuration or the content level—or both—the key factors. And another assumption, the focus on context (Seidl & Friend, 2002), seems to raise the question of knowing in advance where teachers will be placed in order to provide appropriate settings, or alternatively, preparing teachers for all possible settings.

This variety of approaches presents us with strategic questions: Do we actually need to select from these viewpoints? Should we consider these factors together as they help us understand the complexity of designing university-based, field, clinical, and induction settings? How do we bring the intricate collage of all these factors to bear in configuring the best settings for new teacher learning?

Zeichner and Conklin suggest that the way to understand the substance and effect of particular teacher education approaches is by looking inside the program or academic structures to identify important factors related to the view of teaching, learning, schooling. This leads us back to the pivotal focus raised earlier: Do any of these structural factors really matter in and of themselves, if the primary purpose is to tie preparation settings to teacher support for student learning? Do the underlying views on teaching, learning, and schooling impact how well a particular approach supports P-12 student learning—and if so, how?
These studies help us think about alternative routes to teaching. Across these studies, teacher preparation approaches are discussed as if decisions about design of field, clinical, and induction settings are the products of intentional and collaborative planning on the part of researchers and teacher educators. In fact, moving such an expectation for teacher preparation design to become the standard of practice has been a goal of accrediting agencies (see Unit Standard 3, National Council for Accreditation of Teacher Education; Quality Principles 1.3, 2.2 and Capacity 4.3, Teacher Education Accreditation Council (NCATE, 2002; TEAC, 2004)). Over 600 institutions and programs have demonstrated their ability to meet such a standard.

This expectation for rational design of teacher preparation settings may be honored in some district-based alternative preparation programs, but it probably does not characterize the reality for many alternative programs geared up quickly in response to policy mandates whose aim is primarily the urgent reduction of teacher shortages. A major challenge for alternate route programs is to provide adequate and appropriate settings that support new teacher learning and assessment, particularly when individuals with no previous professional preparation are placed into classrooms as the teacher of record. Research studies that show uneven evidence on the impact of alternative preparation programs have cited the lack of uniformity in settings across and within such program structures (Humphrey & Wechsler, 2005). Concerns about attrition levels among alternative preparation candidates add to the significance of this point; the impact of quality in classroom setting and support may be critical not only as a contributor to teacher success, but may also contribute to the predisposition of new teachers to leave the profession when faced with challenges in the early years of practice (Shen, 1997).

These studies on teacher education settings also raise other issues that need attention in research and in the practice of structuring teacher education. There is, for instance, the role of student poverty as an important (some would say primary) factor in the context of school—and therefore in teacher preparation settings; Haberman and Post (1998) give this issue significant consideration. Beyond the need to help candidates understand critical research on the role of poverty and effective approaches to enhance student learning, the factor of poverty needs to be seriously considered by faculty in designing systematic placement and preparation of candidates for field and clinical work (Payne & Biddle, 1999; WEAC, 2006).

Teacher ideology as a factor in effective teaching practice is another significant issue raised by Haberman and Post (1998). In fact, the authors raise a challenge that teacher behaviors critical to success in urban classrooms are intrinsically linked to appropriate teacher ideology, and they assert that this ideology cannot be taught within the structure of traditional teacher education programs. This discussion brings us directly into the professional and public dialogue on defining professional dispositions, relating psychological constructs to professional standards for teacher practice and behavior, and practical or legal constraints on preparation programs. Research studies could contribute significantly to our understanding of how effective settings support development and assessment of professionally-accepted teaching practice. Extending research in this area is especially critical because of the complexities involved in assessing professional dispositions of alternate route teachers whose initial preparation setting is a classroom for which he/she has full responsibility.
OTHER ASSUMPTIONS ABOUT THE ENTERPRISE OF PREPARING TEACHERS: WHAT WE HAVE NOT YET FULLY ADDRESSED

Impact of the growth of online program and/or programs delivered through blended modes

The very concept of “settings” for teacher preparation raises one of the most intriguing of challenges that face professional preparation of teachers in the near term: the inclusion of clinical and field settings in the context of online teacher preparation. Indeed, a major attraction of online programs is the ease of physical access, especially reduction of location and time challenges for the second-career candidates. But the challenges of school settings and supervisory arrangements for professional preparation still matter greatly—in fact, perhaps to an even greater degree when the physical and collegial structures of traditional programs are substituted by distance-delivery tools and dialogue formats (Marra, 2004; Rovai, 2003). As research studies addressing online teacher preparation increase, attention to the field and clinical component of distance-delivery programs can build understandings as to what are the true qualitative distinctions.

Differences in the work to prepare mature learners for teaching

Relatively little attention in these studies links decisions on professional preparation settings to specific research on who teacher candidates are. Increasingly smaller proportions of these candidates come from the 18–24 traditional college student cohort, with increasing numbers representing 27-and-older age groups (NCES, 1997). This trend is accentuated by the growth of alternative route and career-switcher programs in traditional teacher education institutions and in distance-delivery programs. For teacher education to ground design of settings and learning approaches in knowledge of learners’ prior knowledge and in understanding of teaching strategies for adult learners, the research agenda will need to incorporate studies that point toward effective models in teacher preparation.

Content preparation for alternate route candidates

Candidates in alternate route programs are often assumed to have adequate and appropriate content knowledge based on an undergraduate content major, with only the preparation in pedagogy left to be addressed. The reality of differences across undergraduate curricula and assessment measures, however, makes this a questionable assumption. Alternate route programs need to incorporate the same kind of pedagogical content assessment that is conducted in high-quality preservice programs, with special attention to the kinds of knowledge that help students reach learning goals identified in state and national P-12 standards. Settings that provide content knowledge assessment and developmental support for alternate route teachers present a challenge, especially coupled with the need to build teachers’ ability to assess content development in their own students. The initial classroom placement for alternate route teachers becomes a critical factor since it also serves as the basic preparation setting.
A longstanding issue: relationship between theory and practice in learning to teach

Studies of teacher education have often addressed the challenge of bringing educational theory and practice into meaningful and practical balance for beginning teachers. Knowles and Cole note that:

[...]he understanding is that theory and practice are distinct entities; the theory learned at the university and the practice residing and experienced in schools have little connection. The problem is systemic. From the university perspective, there is a concern that the activities taking place during field experiences are often too focused on the immediacy of classroom action, narrowly defined, and too technically oriented. Frequently, preservice teachers enter preparation programs with preconceptions that experiences in the field are all that really matter in the learning-to-teach endeavor, that the university component is to be endured but not taken seriously. These preconceived ideas all too often become reinforced in the field by those with whom they interact. (Knowles & Cole, 1998, p. 669)

This theory/practice conundrum has enormous implications for design of settings in which teachers are prepared. One aspect is noted by Haberman and Post in their observations on the importance of immersion in the P-12 classroom to effectively prepare teachers for urban classrooms, but the issue grows in complexity when we expect a results-oriented marker for successful teacher preparation. What can research tell us about linking specific theory-practice designs and settings for professional preparation to new teachers’ effectiveness in supporting student learning gains?

CONCLUSIONS

We return to the question originally posed: What should we expect from research on settings in teacher education? This dialogue among researchers on settings for teacher preparation gives us the opportunity to . . .

Bring additional perspectives to bear

Hammerness et al. (2005) suggest certain aspects of how teachers learn and develop as being critical components for decisions about teacher education settings. Among these aspects are enabling teachers to develop their own metacognitive knowledge and regulation—in order to reflect systematically and effectively about their own practice, and to develop metacognitive abilities in students. These authors cite a “strong research literature demonstrating that efforts to help students become more active monitors of their own learning facilitate their performances.” Similarly, National Research Council reports describe teaching approaches that facilitate transfer and development of metacognition, including technology-based tools that support learning about the process of inquiry (1999). The papers included in this dialogue tend to separate discussion of settings and context for teacher education from cognitive and academic development, but context and supportive settings are key to helping candidates take on the challenging intellectual aspects of teaching. A goal for future research might be to identify indicators of teachers’ intellectual and cognitive growth that can help link this aspect of teaching effectiveness with specific professional preparation settings.
Influence not only the particular choices about settings for teacher education, but the larger political context of how those decisions are made

Along with the engagement in this academic and rational dialogue, we need also to take cognizance of (and some responsibility for) action within the real contexts in which decisions about settings for teacher preparation are determined; many if not most decisions on teacher preparation are made or heavily impacted by market and political forces. The question for teacher educators and researchers is how to have impact on that dynamic in a way that makes all of this research actually matter.

Move beyond thinking of teacher preparation settings in ways that are unnecessarily oppositional

One way in which professional educators’ political voice might gain more impact is to treat seriously the issue of coming to consensus on the research and practice base, and to find more productive ways of casting our research frames. Zeichner and Conklin reference fruitless “horse race” approaches to research, and their proposed structure is suggested in part as an avenue to bypass more limited frameworks for program comparison. Researchers and practitioners in teacher education need to avoid framing studies as unproductive comparisons or forced choices between either/or options. We do this when we position a choice between either institution-based or school-based models; or when we claim that it is either the settings or the selection of individuals that matters most; or when we position teaching as either an intellectual endeavor or a craft. Other established professions do not see questions of preparation as mutually exclusive choices, but as balances and interwoven components. When we look at the example of medical education, for instance, there is clearly not a triumph of either academic preparation or clinical preparation over the other—both are given due place, time, and role in the structure of professional programs and the elements work in tandem to produce what we consider an appropriately qualified professional practitioner.

What would teacher education look like if we could take advantage of the opportunities embedded in each of these papers? Who in the public or professional community would not be in favor of:

- programs that provide the support and analytical strengths of academic teacher preparation (Darling-Hammond, 1999) with the intensive classroom experience more characteristic of alternate route programs?
- programs that attend carefully to the aspect of selection and admission to teacher preparation (Zeichner & Conklin, this volume), making use of more traditional measures alongside the dynamic ideology and practice-based factors (Haberman & Post, 1998)?
- Programs that retain the academic strength of the PDS model and enhance student learning by greater attention to the diversity of student context and community that characterizes other models (Boyle-Baise & McIntyre, this volume)?

The history of teacher preparation provides ample evidence of tensions between the liberal arts and professional conceptions, between theoretical and clinical preparation, between university-based and school-based approaches. Can we use a more goal-oriented framework for research and experimentation with promising practice to elicit productive gain from complementary strengths found in different approaches? When student learning and student development become the touchstone evidence, it changes the conversation,
and research can help us understand how a variety of approaches contribute to the challenge of preparing today’s students and prospective teachers.

Settings are more than sites

W. Robert Houston
University of Houston

While only one of many factors that characterize teacher education programs, the settings in which programs are located determine in large part their potential effectiveness. The dichotomy often is posed between a strong conceptual/knowledge frame and practical knowledge of schooling, with the university representing one and school-based education the other position. The issues involved are much broader and deeper than the relative roles of universities and schools as sites. Power and prestige, funding and profit margins, definitions of high quality teachers, emphases on academic content or community all are embedded in competing and hotly debated philosophies of teacher education.

SETTINGS FOR TEACHER EDUCATION ARE MORE THAN SITES

The setting for teacher education is not the same as the site, one of its components. The setting is more than the location(s) in which teacher education is practiced. Settings reflect a broad spectrum of factors, including resources available (personnel and equipment/materials), conceptual framework of the teacher education program, prospective teachers (including criteria for admission to the program), sites where prospective teachers learn about effective teaching, cultural and economic contexts, and sponsoring organizations (e.g. universities, for-profit institutions, local educational agencies). Settings also reflect the interrelation of these various factors, the extent to which each is effectively implemented the configuration of their various components, the decision-makers and the decision-making process, and the identified organization in a partnership that is empowered by the state to make recommendations for certification of teachers. Settings refer to the totality of the places, people, and programs that are part of teacher education. Identifying settings that are relevant and drawing on their strengths is one of the issues in educating teachers.

When one uses setting as the focus for examining teacher education, other aspects of the program are put in perspective; because of their interrelationships, the settings for preparing teachers not only influence other factors but are influenced by them. Sites of teacher education (e.g. school, university, store front, web-based technology) structure which programs or resources are appropriate and potentially effective, influence on the curriculum and instructional strategies, and often determine the school in which graduates ultimately will teach.
POLITICS AND POWER

The setting for teacher education and the institution responsible for anointing teachers is a major political and economic factor in America. Prestige and power are generated because of the potential impact of such programs on schools and society. Various agencies have assumed this responsibility over the past century—individual schools, county judges, state boards of education, professional organizations, universities, school districts, and private companies. And, in time, each has begun to take its responsibility and authority for granted, been criticized for the quality of its programs, and been replaced by another agency. Legislatures at the state and national levels, reflecting public sentiment and political power, have enacted laws and regulations governing teacher education, provided funding for special projects or research as well as teacher education programs, and have increasingly required accountability for outcomes.

The process (and the settings for teacher education) is dynamic and continually changing. Settings are not neutral—neutral in terms of their potential power, neutral in terms of their potential training outcomes, nor neutral in terms of their potential for employment. Settings for teacher preparation have changed over the past century as a result of cultural trends and political realities.

SETTINGS FOR TEACHER EDUCATION IMPACTED BY CHANGING CULTURAL CONTEXT

The settings for teacher education are intertwined with their historic, cultural, and economic roots. Settings have changed over the years to meet varying contexts and needs of our nation. Teacher education in the nineteenth century involved primarily practical, on-the-job training, and the basic site was the school. Its settings varied from that of 16-year-old Laura Ingalls Wilder who taught in a one-room school in Minnesota using techniques she had learned as a student, to the state normal schools that provided teacher training for schools in more industrialized areas.

Following World War II, as a result of the GI Bill of Rights, universities provided programs and college degrees to upgrade the knowledge and skills of returning service men and women. Education became an important function in the country, keeping millions temporarily out of the workforce, and in the process, drastically increasing the number of students in universities, the prestige of and need for a university education, and the size and power of universities.

For fifty years, the university has served as the major setting for teacher education. As regional universities matured and expanded their missions, they became less focused on teacher education. Initially, schools of education formed the core of their programs, supported by academic fields to increase prospective teachers’ knowledge of the content they would be teaching. As academic units grew in size and power, faculty in education became less central in the institutions they once dominated. Within colleges of education, teacher education was marginalized as the colleges assumed broader professional missions. Even the names were modified to reflect the broader mission (from College of Education to, for example, College of Professional Studies, College of Education, Health, and Human Performance; School of Business, Education, and Social Work).

The university reward structure in education began to recognize research and publication more than teaching and working in schools, reflecting the criteria of academic departments. As universities shifted their priorities and values, they increased their emphasis on conceptual and theoretical aspects of teacher education and decreased their focus on
practical approaches to teaching. The basic tenets of professional schools (focus on the profession, the market place, and practitioners) were violated, and teacher education more connected to university values.

Schools became less central in preparing teachers. The primary setting became the university campus, with some observation and student teaching occurring at school sites. Schools became “field sites,” teachers referred to as “cooperating teachers,” and control of the process and program, college grades, and authority for certification became the purview of the university, distinctions that signaled the peripheral status of schools in teacher education. One colleague told me thirty years ago during the height of this period that he did not need to go to schools to learn about them; I could go and observe, tell him what I saw, and he would apply his model of teaching to my description to inform me of the validity of what I observed and the potential effectiveness of the teacher. It was an arrogant attitude and philosophy, but pervaded teacher education at the time. The work place (schools) became incidental to learning to teach.

MAINTAINING SETTINGS AS AN EVOLUTIONARY PROCESS

Criticism by teachers, combined with the increasing shortage of teachers able to complete extensive teacher preparation led to compressed internship models of teacher education. School districts, particularly in urban areas, opened fast-track alternative certification programs as a way to decrease the teacher shortage in their communities. Supported by state and federal legislatures, alternative certification programs were initiated by intermediate school districts, medical schools, and for-profit institutions. Universities, not to be out-done, also initiated fast-track alternative certification programs.

Alternative certification programs were touted by educators and the U.S. Department of Education as effective training modes that prepared highly qualified teachers—particularly males and minorities. Like normal school models, they involved in their programs “relevance over rigor” (Labaree, 2003, p. 14) as contrasted with university programs that emphasized rigor and knowledge over relevance and practical preparation.

Darling Hammond in one of her continuing analyses of teacher education quality, charged “that ‘on-the-job’ preservice training leaves teachers seriously underprepared” (Darling-Hammond, 1999, p. 39). The first signs of dissatisfaction with alternative preparation programs began appearing in 2005; school district administrators and human resources specialists began expressing concerns about the effects on student achievement of alternatively certified teachers, preferring teachers with preparation that includes an internship prior to becoming the teacher-of-record.

As these analyses become more widespread, yet another cycle of changes will emerge. Current preparation settings and programs may evolve into new institutions such as Goodlad’s “Centers of Pedagogy” that is designed to bring schools and universities together in a closer, renewing partnership (Goodlad, 1994), increased leadership by private corporations, and institutions aligned with professional organizations, or some yet unforeseen setting.

Technology will no doubt be an important factor in any of the potential futures of teacher education; however, it cannot focus primarily on using technology as an information-downloading resource, thus contributing to “the ‘isolated teacher’ phenomenon. In contrast, focusing on technology’s use for collaboration and communication opens extended opportunities (Fulton et al., 2005, pp. 300–301).
SETTINGS INVOLVE BASIC ASSUMPTIONS ABOUT TEACHER EDUCATION

Settings are influenced by basic assumptions and theoretical constructs of education’s role in society. Two chapters in this section of the Handbook illustrate these differences. Boyle-Baise and McIntyre contrast two teacher education programs with different basic assumptions about education. Professional Development Schools (Castle et al., 2006) assume that the purpose of teacher education is increased student cognition, focusing its attention on standards and effective practices that increase student achievement. Community oriented teacher education (Seidl & Friend, 2002) assumes the purpose of schools is improving the community, relying on strategies such as “service learning, cultural immersion, and participation in community schools” (Boyle-Baise & McIntyre, this volume). Both rely on strong partnerships between universities and schools but their settings are radically different. Each involves very different content and processes in their teacher education programs, different strategies in schools, and different outcomes by graduates. The same sites could provide different settings as a result.

The quality of the site influences the setting. Boyle-Baise and McIntyre insist that teacher education is improved through an integrated school site jointly managed by the university and school, whether in the Professional Development School model or the Community oriented model. By working in the most effective environment, prospective teachers tend to gain the skills they need to be effective. Haberman and Post, on the other hand, state that “training is most effective when it is offered in the worst schools under the worst conditions of work” (Haberman & Post, 2001, p. 103). One believes prospective teachers should be exposed to the best teaching while the other points out that because prospective teachers are likely to be placed in the most troubled inner-city schools, they should have experience in those environments. Basic assumptions of teacher education as well as the quality of schools are infused into the selection of sites, activities that occur in those sites (e.g. community studies and interviews; lesson plans and instruction), persons involved in the program, and relations with schools and communities.

SETTINGS INVOLVE CULTURAL CONTEXTS AND CURRENT EVENTS

Settings for teacher preparation and the nature of that preparation are interrelated with the evolving culture of our nation. The purpose of schools in the nineteenth century was to prepare children in reading, ’riting, and ’rithmetic, the three r’s needed to work in the factory. The environment of Laura Ingalls Wilder at the turn of the twentieth century was quite different in her agrarian community from that of the workers in Lexington, Massachusetts with its tightly packed population and factory-dominated community. Schools were different. Laura’s dozen students were of multiple ages and stages in their education, some as old as eighth-grade-educated Laura. The education of teachers in Minnesota and Massachusetts was different. Both were educated on the job—Laura by remembering what and how she had been taught, while in Massachusetts a “principal teacher” supervised teachers as schools reflected the factory model of the evolving industrial age.

The purpose of schools today has become more complex and related to a world-wide culture with increased communication and transportation, world-wide economic conditions, and systemic impact of events half a world away. Reports of our nation’s poor achievement on mathematics tests and shortage of professionals in Science, Technology,
Engineering, and Mathematics (STEM) or a report of the influx of immigrants creates renewed interest in these areas to the diminution of others. The United States has become a multicultural society, not only in regard to ethnicity, but also to religion, gender, and conservative/liberal traditions.

Immigration has changed our nation and in the process changed teacher education. At the turn of the twentieth century, the majority of immigrants were from northern Europe, either well-educated or with advanced technological or professional expertise. Protectionism during the 1930s and 1940s lowered the number of immigrants, and then increased with immigrants from southern Europe. Near the end of the century, waves of immigrants from Central and South America and from Asia sought to move from poverty or war to the United States with its reputation for wealth. Complex interaction of employment options, health and retirement benefits, global economy, US status in the world, age and ethnicity of population, educational level of new immigrants—boat people from Cuba and southeast Asia—all are interrelated with the setting of teacher education. Education in schools and teacher education has responded to the new needs promulgated by immigrants; bilingual programs and English as a Second Language, for example, have become vital with the influx of Hispanics and Southeast Asians in the past decade.

DIGITAL DIVIDE AS SETTINGS

A rapidly expanding setting for teacher education involves increasingly sophisticated technology and prospective teachers (and their students) who are more comfortable and uninhibited with technology than their parents. They readily engage in multitasking while using their cell phones, i-pods, digital cameras, blogs, chat rooms, maintaining virtual relationships, using Google or some other search engine to conduct a literature review instead of going to the library, sending and reading e-mail, turning in assignments via the internet, observing a classroom using a miniature camera while located in the university or at home, engaging in distance learning, and making power point in presentations. Using this increasingly sophisticated technology becomes a challenge in preparing teachers—not only in most effectively using it in teacher education, but also supporting prospective teachers’ appropriate use of technology in their classrooms.

What is critical about technology in teacher education is not so much developing an understanding of how to use various modes and to maintain currency in their use, but to derive the greatest strengths from them. For example, search engines such as Google have become popular in conducting research or finding information about a particular topic; it is faster and more efficient than going to the library. The quality of outputs, however, varies widely as some sites reflect extensive thought and research while others are shallow and often involve propaganda or radical perspectives. Being able to analyze sources, inquire into relevant areas, and use judgment in making decisions are vital qualities in teacher education. Settings involve not only the use of technology but how technology is used, the thought processes involved in solving problems by drawing on technological innovations.

HUMAN SUPPORT SYSTEMS AS SETTINGS

The setting for preparing prospective and novice teachers includes the quality and attentiveness of the persons with whom they work in the program. This includes course instructors with their knowledge of their fields as well as staff in their preservice and
beginning teaching assignments. Often referred to as mentors or coaches, some organizations have paid and trained them while others have relied on the good will of their teachers to work with beginning teachers, interns, student teachers, or pre-student teachers. Some are part of the preparation program; others volunteers who take on an additional assignment. The prospective teacher may interact with them only for short periods, have only superficial contacts, or work with them for extended periods. The quality of this support varies widely; they may have a coach who is concerned about them, advises and counsels them, and makes the program more useful. This human support system defines a vital aspect of setting.

Relationships among teacher educators in the university (or other sponsoring agencies) and schools is another aspect of setting. The contributions of each partner, the personal relations among them, and the integration of program content are part of the psychological settings of teacher education.

SETTINGS AS INTEGRAL TO TEACHER EDUCATION

The various components of teacher education are connected to one another in such a way that each contributes to the others and draws from them. As we examine the settings of teacher education, we recognize that they influence the curriculum, the instructional strategies, even the persons who select that setting for their education, and the school in which they will teach.

An analysis of the settings for teacher education identifies the maze of interrelationships that are involved and the relative impact each has on all the others; teacher education, indeed, is a system that can be defined by its setting. Settings change in response to political trends, hypotheses of quality teacher education, cultural and technological contexts, and economic conditions. It is in the continued exploration of these factors that teacher education can become more effective with greater impact on the education of future generations.

Who teaches? Who should teach?

Teacher recruitment, selection, and retention

Editor: A. Lin Goodwin
Part 4

Framing chapters
23 Defining teacher quality
Is consensus possible?

A. Lin Goodwin
Teachers College, Columbia University

INTRODUCTION

In the Ninety-eighth Yearbook (Part 1), of the National Society for the Study of Education (NSSE)—a volume devoted to the critical analysis of teacher education—editor Gary Griffin states:

“Whoever teaches in our schools, we must reaffirm and strengthen our intentions to recruit into teacher education the capable rather than settle on the available. At issue, of course, is the initial determination and subsequent monitoring of capability.”

(1999, p. 7)

Twenty-five years prior, NSSE’s Seventy-fourth Yearbook focused also on the education of teachers, and editor Kevin Ryan articulated a similar question “Where do we get the teachers who can do these things?” by which he meant those who can “be effective teachers of our children” (1975, p. ix). The issue of capable or qualified teachers is clearly one that has endured in the teaching profession and in U.S. society. Who teaches? Who should teach?

There is no argument that everyone is interested in capable, qualified and quality teachers for all our nation’s classrooms, from the families who send their children to school, to policy-makers who shape the structure, governance, and funding of the education enterprise, to multi-national corporate conglomerates eyeing the next generation of skilled workers. Indeed, the question—who does or should teach—is an enduring one in large part because everyone is interested in and concerned about the capabilities and qualifications of teachers. However, the heart of the concern is not simply that teachers should be capable or qualified, but what constitutes capableness or qualification. Thus, each constituency comes at the question with different definitions of teacher quality and different ideas about what teachers should know and be able to do, ideas and definitions that are framed by different values, socio-cultural norms, and aims.

A closer examination of the contexts surrounding and informing these different values, norms and aims offers additional insight into the longevity of this question of who should or can teach. First, as crucibles of culture and historical memory, schools—and the curriculum—play a key role in the socialization of citizens and the conveyance of national priorities. Because teachers occupy a central position in the educational enterprise and interact directly with developing citizens (i.e. children and youth) as they implement, deliver, direct, and often even create, the curriculum, they become, in essence, guardians of the country’s collective socio-cultural legacy. What knowledge is of most worth and whose values are emphasized or understated represent fundamental battles that continuously play out over time and surely will never be resolved. It is no surprise then that the
part teachers play in this fundamental battle fuels keen and universal interest in who is permitted to teach.

Second, the state and quality of schooling and academic achievement are consistently linked to the economic health of the country. Our ability to compete internationally is increasingly measured in terms of students’ performance on large-scale standardized assessments, and how their scores compare to the performance of their counterparts in other countries. Students’ performance levels are seen as a reflection of teacher quality, competence, and preparation—better teachers are presumed to lead to better test scores. Maintaining our economic edge keeps our attention on teacher quality.

Third, the struggle for equal educational access is a theme that undergirds the U.S. story. The opportunity to learn is/should be a fundamental right for all citizens in a democracy. In the history of this country, that right has been systematically denied many groups, and the fight for educational equity and parity continues today, even while gains have been made. Who can or should teach is a question that is inextricably tied to definitions and enactments of diversity, democracy, and equality because it brings into the foreground issues such as the representativeness of the teaching force, teacher preparation for diverse school populations, and the (un)even distribution of quality teachers across dissimilar communities. In a diverse democracy, where the common good constantly competes against individual interests, debates about how teachers should be prepared, what their knowledge base and skill sets—not to mention mindsets—should include, and who should be deemed fit for practice, will be ongoing.

Clearly, consensus around definitions of capability, qualification, and quality continues to be elusive, despite sustained discussion throughout educational history on these very matters, discussion that remains robust and very contemporary, as a glance at any educational journal or newspaper will reveal. Thus, the teaching profession continues to struggle with a fundamental dilemma. On the one hand, we must decide who should be in the teaching force and therefore enticed to teaching. On the other hand, we must weigh who should be allowed to teach, or is considered ready for teaching. In the current context of teacher shortages in some areas and surpluses in others, a teaching force that is far from representative of the population of schools, and sharp disagreements about how teachers should be prepared, we are required to simultaneously recruit and reject, draw people to the profession and sift through them to weed some out. Undoubtedly, the questions surrounding the composition and competence of the teaching force have perennially perplexed the profession and constitute the core of this section.

Through a series of four framing chapters, the section examines the challenges of recruiting, preparing, and retaining teachers of diversity and quality given shifting demographics and evolving global economies. What lessons does history offer in terms of attracting teachers and meeting teacher shortages? How has the demographic makeup of teachers changed over time and in what ways have our efforts to build a representative teaching force had any impact on who enters the classroom? On what basis has the profession made decisions about who is fit to teach and can be recommended for certification? How do these issues of diversity, quality, representation, readiness, and recruitment intersect and what kinds of dilemmas do they raise for teacher educators?

In the initial chapter, Karen Zumwalt and Elizabeth Craig provide a backdrop for the section by profiling today’s teaching force according to demographic and quality characteristics. Their discussion is framed by four questions: “Who is teaching? Where are they prepared? Where do they teach? How long do they stay?” They then sift through these background characteristics, using extant research studies, in an effort to ascertain possible relationships between demographic variables or quality indicators and student learning outcomes. From analysis at a macro level, Zumwalt and Craig shift to a more
focused examination of one specific demographic characteristic—teachers’ race/ethnicity—and one specific quality indicator—teachers’ academic ability/achievement—as a way of detailing and illuminating the complexity surrounding any effort to draw a relationship between teacher variables and learning outcomes for students. Their chapter offers considerable insight into the issues surrounding recruitment, pedagogical competence, and definitions of quality teaching. More importantly, their work gives us pause in terms of the importance of certain characteristics or variables, regardless of whether they are supported by empirical evidence or have been proven to positively impact student achievement. Some of these characteristics carry a moral or social value that cannot be measured but instead speaks volumes about what we care about as a society and who we are.

Zumwalt and Craig’s work segues nicely into the chapter authored by Susan Moore Johnson and Susan Kardos, which focuses on the recruitment and retention of teachers. Thus, the section moves from a broad, overarching portrait of who is teaching or present in the teaching force, to the work of Johnson and Kardos that addresses specifically why teachers are drawn to the profession (or repelled/deflected from it), and what structures, incentives, and strategies seem to keep them in the profession. Johnson and Kardos deftly link the past with the future by comparing what seemed to work in terms of recruitment or retention for the previous generation of teachers, with what will need to be in place or factored into the equation when we think about attracting the next generation of classroom practitioners. Their analysis concretely reveals that today’s potential teacher candidate or new teacher holds fundamentally different ideas about career trajectories, workplace environments, and what Lortie (1975) calls “psychic rewards.” Their expectations and the experiences they bring to the profession, differ dramatically from those of veteran teachers currently in the profession and winding down to retirement. Changes in labor market conditions and in opportunities for skilled workers, particularly women and people of color, mean that the teaching profession cannot, as it did in the past, rely on a readily available pool of candidates, as Griffin describes in the opening of this introduction, and must think imaginatively about how to recruit and retain those who are capable.

Mary Dilworth and Anthony Brown address the critical shortage of teachers of color by tackling the question—what do teachers of color bring to the classroom and does it matter? Coming on the heels of an in-depth discussion of recruitment and retention, it is fitting that Dilworth and Brown should examine closely the value teachers of color add to the profession, so as to underscore the ways in which a representative teaching force is so much more than simply a superficial demographic concern. In their chapter, Dilworth and Brown take a historical perspective and chronicle the presence, preparation, and practice of African American, Hispanic American, Chinese American, and Native American teachers. Their analysis underscores the important role these teachers of color played as socio-cultural stewards and translators, as culturally responsive pedagogues, and as key community members imbued with the spirit of racial uplift. Their discussion also sheds light on how families of color struggled to ensure that their children received quality education and were instructed by quality teachers from within their community. While much of the chapter is located in the past, Dilworth and Brown use history to inform contemporary dilemmas and current practice. They suggest that today’s challenges surrounding the appropriate education of children of color, whether in rural schools or central cities, would undoubtedly benefit from the wisdom inherent in the practice of teachers of color, wisdom that too often goes untapped or unacknowledged.

The final chapter authored by A. Lin Goodwin and Celia Oyler departs from the other chapters which focus on who is in the profession or should be, and attends to the
question of teacher readiness and who should be allowed into the profession. The issue of teacher quality is currently very salient. Yet, prevailing discussions about teacher quality have emphasized teacher characteristics prior to entry into the profession—such as GPA or subject matter knowledge, and teacher performance—on teacher tests for instance, post entry into the field. Goodwin and Oyler suggest that what is missing from these discussions is an examination of the learning-to-teach process and teacher educators’ roles as gatekeepers for the profession. In their chapter, Goodwin and Oyler analyze the role, structure, and function of teacher education programs within the context of teacher certification. They then describe practices, procedures, policies, and assessments that teacher preparation programs employ as they make decisions about teacher candidates’ readiness to teach, using data gleaned from the literature as well as from a representative sample of teacher preparation programs across the country. Finally, the chapter presents the dilemmas and issues teacher educators face as they struggle to uphold standards of quality teaching in the face of competing demands as well as teacher candidates who bring many needs and diversities to the table.

Each of these four chapters offers a different viewpoint of and response to the central questions of the section: Who teaches? Who should teach? While each offers a particular conversation, all four speak through shared lenses—social milieu (economic, political, sociological), diversity, and shifting social norms. Together, they make us aware of the numerous factors, structures, policies, and players involved (entangled?) in the development of an excellent teaching force, even while they remind us that definitions of quality and excellence depend on a wide range of contextual variables, ideologies and political forces, and are often in conflict as a consequence.

As a collection, the chapters are framed by a variety of artifacts, some historical, some contemporary, some text-based, others visual, some in narrative form, still others organized as a series of bullets. These artifacts also offer varied perspectives on issues of teacher quality, characteristics, recruitment, retention, and diversity. They help to expand the discussion and add texture and richness; they become a series of different lenses through which to contemplate the perennial concern with teacher quality.

Three commentaries written by scholar educators conclude the section. Each commentary is designed to be an integrative statement on the central focus of the section by drawing upon, or spring boarding from, the framing chapters in concert with the artifacts. The commentaries simultaneously insert the voices of diverse educators who are situated very differently and therefore speak from the unique space in which they are located.

The commentary written by Mary Futrell offers the perspective of a teacher educator who is also a seasoned education Dean. It is no surprise then that Futrell’s commentary takes a broad look at teacher preparation with an eye toward teachers for the next century. Futrell challenges the teacher education profession to dramatically change what it has been doing in the name of teacher preparation, if it is to keep pace with changing technology, demographics, and a global economy, and produce teachers for the future, not the past. In order to accomplish this, Futrell acknowledges that the teacher education professoriate needs to “consider the implications of the emerging societal challenges, the changing roles of faculty and what their priorities should be as they prepare tomorrow’s teachers, counselors, and school administrators.” In other words, teacher preparation will not change if teacher educators don’t also change.

As a sociologist, Richard Ingersoll argues that “fully understanding issues of teacher quality requires examining the character of the teaching occupation and the social and organizational contexts in which teachers work.” In his commentary, Ingersoll deconstructs commonplace explanations for low teacher quality, and suggests that three
primary explanations are largely inaccurate. These explanations include: restrictive occupational entry barriers; teacher shortages; and under-qualified teachers. Ingersoll discusses each in turn and counters conventional perspectives by offering alternative explanations and identifying weakness in each argument. He concludes that conventional explanations for low teacher quality are incomplete if they do not take in consideration the nature of teacher’s work and the organizational structure of schools.

The third commentary is authored by a practicing teacher. Meghna Antani Lipcon exemplifies the talented liberal arts graduate who has many vocational choices and is therefore less likely to go into teaching. Yet, Antani Lipcon not only chose to go into teaching via a university-based teacher preparation program, but also chose to teach in a “challenging” school (i.e. one that served culturally and linguistically diverse, poor children who were not achieving academically). Her commentary clearly shows that attracting bright, academically prepared people to teaching—and keeping them—requires giving them the opportunity to use their minds, to participate in decision-making at the school as respected instructional leaders, and to develop professionally. Antani Lipcon also speaks passionately about the importance of a diverse teaching force, and uses her own experience as a teacher of color as an example. Ultimately, she says, “those who choose to teach come for the kids, but stay because of the intellectual stimulation and ability to truly make a difference.”

Elizabeth Craig
Bard College

Three million teachers work in our nation’s public schools teaching almost 50 million children and adolescents. In this chapter, we describe these teachers in terms of background characteristics and then look at whether these characteristics make a difference in the education of their students. The characteristics we look at include demographic characteristics (i.e. gender, race/ethnicity, socioeconomic background, age) and other background characteristics that have been used as indicators of teacher quality (i.e. college entrance tests, college GPA, college major, status of college attended, teacher tests and teacher certification).

In essence, these background characteristics are what teachers bring to teacher preparation programs and then to K-12 classrooms. Taken together, these characteristics are often used to describe the demographic and quality profile of the teaching force. The demographic profile, while sensitive to policy, is largely influenced by individual career decisions, shaped by larger social forces evolving over time. In contrast, teacher educators, state education officials and school administrators have more impact on the quality profile of the teaching force, within the parameters of those who choose to teach. Hence, we are looking at background characteristics that have different susceptibility to being directly shaped by policy makers and teacher educators. In turn, these background characteristics may have differential impact on the education of students.

Before turning to issues raised by these background characteristics of the teaching force, we describe how the demographic and quality profiles look in response to four questions: Who is teaching? Where are they prepared? Where do they teach? How long do they stay? Then, we look at what the research indicates about the relationship of these characteristics to student achievement. The chapter ends with a consideration of whether these background demographic and quality characteristics of teachers matter.

WHO IS TEACHING?

Most teachers are female, White and monolingual. Approximately, 75 percent are female (U.S. Department of Education, 2005) and 84 percent are White (Snyder et al., 2004). While the percentage of teachers of color, especially prospective teachers, has increased slightly in recent years, it does not match the increase in student diversity. While more minorities are graduating from college, a smaller percentage of Black college graduates now chooses teaching than in the past when teaching was one of the few professions open to them (Murnane et al., 1991).

Historically, teaching has attracted people from all socioeconomic backgrounds, but, as a middle class occupation, it has been an upwardly mobile choice for those from the working and lower-middle classes. The majority of teachers’ parents still do not
have high school or college degrees, but they are more likely to have college-educated parents than in the past, reflecting the increased educational level of Americans (National Education Association [NEA], 2003). While more teachers are coming from higher SES backgrounds, a counter trend is that higher SES females and minorities now have a range of other job possibilities that were not previously available to them and are not choosing teaching in as high proportion.

The average age of teachers is in the low 40s, reflecting in part the graying of the workforce, as well as the older age of college graduates and the growth of graduate and alternative programs. The average age of prospective teachers has been rising. The majority of teachers now enter teaching between the ages of 25 and 29, rather than under the age of 25, as in the past (Provosnik & Dorfman, 2005).

Recent studies of teachers’ academic ability and achievement have produced a somewhat more positive picture than the dismal one portrayed in the late 1970s and early 1980s which echoed earlier perceptions of the teaching as a “failure belt” (Waller, 1932). This improved picture probably reflects both the results of teacher education reform efforts and better research methods.

Studies that have followed cohorts of students through the teacher education pipeline have been particularly informative. Five findings have emerged from recent data. (1) Researchers have clearly demonstrated that earlier studies relying on high school students’ career intentions are misleading since these students are not the same population that actually prepares to teach or becomes teachers. (2) When differences among college students are reported, prospective teachers tend to have lower college entry test scores but higher academic achievement, as measured by high school GPA and rank, and college GPA. However, these differences may largely reflect gender imbalances, since women generally earn higher grades and under-perform on entrance tests. (3) More lower ability students exit the teacher pipeline at each successive stage (high school graduation, college entry, entry into teacher education programs, graduation from college.) By graduation, those prepared to teach have higher than average SAT/ACT scores compared to students entering college. (4) While their average scores are slightly lower than all college graduates, those preparing for secondary teaching have comparable scores. (5) Those in the top SAT/ACT quartile are less likely to take jobs as teachers and, once in the classroom are less likely to stay (Zumwalt & Craig, 2005b).

WHERE ARE THEY PREPARED?

Although there are a growing number of extended teacher education programs and 46 states now offer alternative programs, most prospective teachers are still prepared in baccalaureate programs at public institutions (Feistritzer, 1999; U.S. Department of Education, 2005). Graduates of selective institutions are less likely to become teachers than those at colleges and universities ranked as average or below average in selectivity (Ballou, 1996; Henke et al., 1996; Henke et al., 2005). However, because of changing state and institutional requirements, more teachers now graduate with regular content majors rather than just education majors.

The numbers of prospective teachers of color vary widely by region and by institution. They are more likely than Whites to start their higher education at two-year colleges and transfer to four-year public institutions for teacher preparation.

Teachers with higher SES backgrounds are more likely to have attended private institutions. Although there are few studies, there is some indication that those with higher SES backgrounds are more highly represented in alternative programs that recruit from elite,
private institutions, more likely to be “late entrants” to teaching, and more likely to have graduate degrees at entry (Heyns, 1988; Wenglinsky, 2000).

Despite fears that extended teacher education programs would create another barrier for students of color, graduate and alternative programs attract similar or higher proportions of students of color (Andrew, 1990; Cornett, 1992; Darling-Hammond et al., 1989; Feistritzer, 2003; Kirby et al., 1989; Kirby et al., 1999; Kopp, 1994; Lutz & Hutton, 1989; Natriello & Zumwalt, 1993; Shen, 1998; Stafford & Barrow, 1994). While still predominantly female, graduate level and alternative programs also attract proportionately more males than undergraduate teacher education programs (Jelmberg, 1996; Kopp, 1994; Wright et al., 1987).

Research on the quality profile of graduate and alternatively prepared teachers compared to those prepared at the undergraduate level is scant and inconclusive, although those who pursue post-baccalaureate education are generally presumed to have higher academic achievement than those who do not. By design, alternatively prepared teachers did not major in education, but that does not necessarily mean that they majored in the subjects they are teaching. In fact, teachers prepared in undergraduate and graduate programs may be more likely to have majored in subjects they are teaching because of stricter state regulations governing these programs. As a growing number of colleges—many NCATE-accredited—offer alternative programs, the assumed differential between the quality of alternative and regular programs may diminish, as well as any differences in the background quality indicators of their students.

Teacher test scores, taken as either entry requirements to teacher education or just after teacher education programs as students seek state certification, indicate some demographic differences. The highest SAT and teacher test scores were found among students attending private universities, which generally enroll students with higher SES backgrounds (Wenglinsky, 2000). Teachers graduating from teacher education programs had higher test scores than those who were not prepared in such programs. An ETS study found that graduates of NCATE accredited institutions were more likely to pass the PRAXIS II content tests than graduates of non-NCATE institutions, when controlling for students’ college entry scores (Gitomer et al., 1999). White applicants had higher passing rates on teacher tests; higher proportions of minorities, particularly Blacks and Hispanics, did not pass the tests. Hence, the effect of these tests raises the quality profile but may restrict the diversity of the teaching force.

Given the very inclusive definitions of certification often used, most teachers have been counted as “certified” and, therefore, deemed qualified. The actual proportion certified depends on the types of certification counted (e.g. regular, alternative, provisional, transitional, emergency) which vary greatly by state and even locale. Hence, without specific analysis of how “certified” is being defined, using certification status as a quality indicator is problematic.

WHERE DO THEY TEACH?

Teachers’ reasons for teaching and their expectations show some variation by gender, race/ethnicity, SES and age. Fewer than half those prepared to teach actually teach the next year (Henke et al., 2000). Some delay entry but others never teach (Heyns, 1988; Murnane & Olsen, 1988). Prospective elementary teachers are more likely to enter teaching than secondary teachers (Murnane & Schwendin, 1989). Prospective teachers in the top SAT/ACT quartile are less likely to take jobs after becoming prepared as teachers (Kerr, 1983; Pigge, 1985; Wirt & Livingston, 2002).
New first time teachers represent an increasing proportion of the teaching force; they are older, more diverse and include more males than in previous years (Broughman & Rollefson, 2000; U.S. Department of Education, 2005). These new teachers are more likely to find their first jobs in harder-to-staff, lower performing rural and central city schools with high proportions of minority and low-income students (Henke et al., 2000; Lankford et al., 2002; Wirt et al., 2001.) Alternatively prepared teachers, especially non-Whites, initially are more likely to take positions in urban schools (Natriello & Zumwalt, 1993; Shen, 1998).

Teachers of color disproportionately teach at the elementary level and are found more often in central cities and schools serving high proportions of minority and low-income students (Henke et al., 1997). Females and elementary school teachers are slightly younger than male teachers and secondary teachers. Rural teachers are younger than their counterparts in urban and suburban schools, reflecting the greater proportion of new teachers hired in rural schools.

Teachers with master’s degrees are more likely to be found in the suburbs, in high schools and in the Northeast (Feistritzer, 1996). Some studies have found that fewer teachers hold masters degrees at schools with large numbers of low-income students (Lewis et al., 1999).

The high proportion of reportedly certified teachers drops considerably when looking at whether teachers are certified in the areas in which they teach most of their classes (“main field”) or in the other areas they teach. Most uncertified or partially certified teachers are recent entrants to teaching (U.S. Department of Education, 2005). Besides its relation to experience, certification status also varies by teaching field. Teachers in departmentalized contexts (e.g. many middle and high schools) are less likely to be certified than elementary teachers. Bilingual and special education teachers are the least likely to be certified. Schools serving low-income and minority students have more inexperienced teachers and teachers without full certification (Darling-Hammond, 2004; Henke et al., 1997; Kirby et al., 1999). Some studies also indicate that these schools are more likely to have teachers from lower SAT quartiles, teachers from lower status colleges and teachers more likely to have failed at least one teacher test. Data on “out-of-field” teaching is less conclusive because of differing definitions, but often indicates more “out-of-field” teachers in poor and central city schools (Lewis et al., 1999).

As states have raised criteria for certification as well as entry into and graduation from teacher education programs, it is not surprising that the quality profile of teachers looks better than it did prior to reforms instituted over the past 20 years. There is concern, however, that shortages of fully certified teachers in “hard to staff schools” serving lower SES students combined with demands from No Child Left Behind (NCLB) have put increased pressure to adjust definitions of “certified” to include those who would not previously have been labeled “certified” to meet compliance regulations.

HOW LONG DO THEY STAY?

Teacher turnover is the largest determinant of demand for new teachers. Average turnover is about 30 percent, with about 17 percent switching teaching assignments, 7 percent moving to another school and about 6 percent leaving, either temporarily or permanently (Boe et al., 1998). Of those leaving, more than half return to teaching after a break. In recent years, a growing proportion of teachers are staying in their classroom positions for longer periods of time. Attrition is expected to rise as more teachers reach retirement age and younger teachers, who traditionally have higher attrition rates, replace them.
Age is the prime demographic contributor to attrition, with the highest rates among the youngest and oldest teachers, creating the “U” shaped curve consistently found in retention studies (Ingersoll, 1999; Whitener & Gruber, 1997). Attrition rates are confounded by the fact that more women take breaks from teaching, primarily for childbearing and rearing (NEA, 1997). Although female teachers take more breaks, findings on overall rates of attrition by gender are mixed (Boe et al., 1998; Hanushek & Pace, 1995; Whitener & Gruber, 1997). For instance, while attrition rates are higher for secondary teachers, who are less likely to be female, they are also higher for special education teachers, who are more likely to be female (Boe et al., 1996). Attrition rates are slightly higher for teachers of color than for White teachers, primarily because of recent high attrition rates amongst Hispanics (Whitener & Gruber, 1997). Teachers from higher SES backgrounds and those from higher SAT/ACT quartiles are less likely to stay in teaching. The relationship between attrition and teacher test scores is inconclusive.

Findings comparing attrition rates between alternatively and traditionally prepared teachers and between those with undergraduate and graduate degrees are also mixed, indicating the need to look at school level, subject, type of school, time frame, race/ethnicity of teacher. Despite expectations, yearly attrition rates for math and science teachers are near average (Ingersoll, 1999; Texas Education Agency [TEA], 1995; Whitener & Gruber, 1997), and the highest attrition rates are in small private schools, not large urban public schools (Ingersoll, 1999).

RESEARCH ON THE RELATIONSHIP AMONGST DEMOGRAPHIC VARIABLES, QUALITY INDICATORS AND STUDENT ACHIEVEMENT

Most of the “impact” research in teacher education is actually correlational research, where student outcomes are operationalized as students’ scores on standardized achievement tests (Cochran-Smith & Zeichner, 2005). This being said, there are not many studies that assess the impact of the demographic characteristics of teachers on student achievement. While the large number of female teachers may have an impact on the public and prospective teachers’ perceptions about teaching, the evidence indicates that generally it is not related to student learning, as measured by achievement tests (Brophy, 1985; Evans, 1992; Gold & Reis, 1982; Humrich, 1988). The impact of the aging teaching force has been studied primarily with a view toward its consequences for potential teacher shortages rather than its relationship to student achievement. The impact of the dominant monolingual teaching force, despite the growing number of limited English proficient students, and the SES background of teachers have not been studied.

The demographic variable of most concern is the racial/ethnic composition of the teaching force, particularly since there is an increasing gap between its diversity and the diversity of the student population. Research on the relationship between the match between a teacher and student race/ethnicity and student learning is mixed. Several studies (Ehrenberg & Brewer, 1994; Ehrenberg et al., 1995; Farkas et al., 1990) found little association between race, gender, and ethnicity of the teacher and of the students, and how much students learned. Contrary evidence has been found by Ehrenberg and Brewer (1995) in a re-analysis of the Coleman et al. (1966) data and in several recent studies in relation to Black teachers and students (Clewell & Puma, 2003; Dee, 2001; Evans, 1992; Hanuscheck, 1992). The findings may be mixed in part because many of the studies ignore SES of students and teachers (Zumwalt & Craig, 2005a).

While the relationship of the ability/achievement profile of teachers and student
achievement might seem obvious, the research support for such claims is not as strong as might be expected. Studies exploring the impact of differences in teacher ability, largely measured by test scores, have focused on the relationship to student test scores, rather than teachers’ actual classroom practices. Analyses generally provide mixed results, such as different relationships between teacher test scores and student reading, vocabulary or math test scores or differences depending on the match between the race of the teacher and the students. While several recent studies provide stronger evidence of a relationship between teachers’ verbal ability and student achievement, there is no evidence about the relative importance of verbal ability compared to other aspects of teacher quality (Zumwalt & Craig, 2005b).

Research on the impact of subject matter knowledge, another quality indicator often expressed as majoring in a content area rather than education, is scant and inconclusive, except in the area of mathematics. Studies of secondary mathematics teachers generally show a positive relationship between teachers’ study of mathematics and the mathematics learning of high school students (Floden & Meniketti, 2005).

The mostly inconclusive research on the impact of master’s degrees is confounded by the lack of information about the content of the degree and whether or not it is a preservice or inservice education degree. However, Rivkin et al. (2005) conclude that a masters degree is not significantly related to student achievement. In contrast, Rowan et al. (2002) report that having a teacher with advanced degrees in mathematics had a negative relationship to student achievement in math. They speculate that advanced degrees in math may have substituted for pedagogical preparation in mathematics or that these teachers’ advanced understandings made it more difficult for them to explain the knowledge in simple terms to elementary school students.

Although accreditation, teacher testing, and certification are seen as important elements in maintaining and improving the quality profile of teachers, there is little conclusive research which links these regulatory mechanisms to improved student achievement (Wilson & Youngs, 2005).

DOES IT MATTER?

Parents and students know on a personal level that teachers make a difference—it does matter who teaches them. And politicians and the public generally agree that teachers are a significant factor in students’ learning. Yet there is not strong research evidence that teachers’ demographic characteristics and most of the quality indicators described here make a difference in student learning. Are we left to conclude that perhaps the only demographic or quality characteristic that matters is teachers’ verbal ability, as measured by standardized tests? Is there no need to attract and retain a diverse group of teachers to our public schools? Should teacher verbal test scores be the critical background criterion used in setting admissions standards to teacher education programs and establishing standards for teacher certification?

Although strong empirical research evidence has become the sine qua non in current policy debates, we believe there are compelling reasons not to answer the “what matters” question only by marshalling existing “scientific” evidence. First of all, just because there is no or little research demonstrating relationships does not mean the relationships do not exist. Current research is mostly correlational, not causal, because it is hard to set up the conditions of experimental research, such as randomized sampling and control of independent variables in the midst of providing equal educational opportunity to public school students. Teaching is a tremendously complex act, involving numerous variables
and on-the-spot decision making by teachers that defy easy operationalization and control. What works for different groups of students and for individual students within those groups provides incredible variation that interacts differentially with teachers’ background demographic and quality characteristics.

For obvious reasons, most of the correlational research looks at the relationship between demographic and quality characteristics and student learning, without making the connection between intervening variables such as teacher knowledge, beliefs and practice, and student attitudes and behavior. The background quality indicators used here are proxies for the quality that really matters—quality teaching. They obviously cannot be equated with quality teaching, but since they are relatively easily obtained and measurable, it is clear why they are used in research. And for equally understandable reasons, student learning is most frequently limited to the kind of learning that is measured on standardized tests—an important but narrow view of the intended outcomes of public education. Are other cognitive outcomes, attitudes, healthy self-concept, cultural identity, graduation, college entry, avoidance of risky behavior and good citizenship—to name a few of the other goals of public education—affect by teacher characteristics?

What is needed are large, longitudinal studies, using quantitative and qualitative methods, that take into consideration multiple and related student, family, teacher and school variables, capture intervening variables such as teacher and student knowledge, beliefs and behavior, as well as more robust definitions of student outcomes. The research challenge is substantially beyond anything we have been able to do. Add into this mix the fact that teachers, individual students and groups of students all have personalities and experiences that may connect or not connect in meaningful ways and the research challenge appears overwhelming. We also need to remember that even if more empirical research were available about background demographic and quality characteristics of teachers, while informative, it would never be able to provide definitive criteria for policy makers in relation to recruitment, preparation, placement, and retention of teachers because teaching is such a complex, value-laden social and political activity.

One could argue, whatever the extant research about impact on student outcomes, that there are good reasons to be concerned about the demographic diversity of the teaching force and its “quality” as described by common quality indicators. Public perception of the profession—both in terms of demography and quality characteristics of teachers—influences support for teachers, schools, and education. The profile also sends messages about teaching and teachers that influence who is attracted to teaching, where they choose to teach, and who decides to stay in teaching. The differential distribution of teachers, particularly in terms of perceived “quality” indicators, sends a powerful message. A society committed to equal educational opportunity for all children cannot afford to ignore the messages the public, teachers and prospective teachers receive about the demographic and quality characteristics of the teaching force.

While aiming for demographic diversity, a quality teaching force may seem like an indisputable goal on the face of it. Despite the lack of definitive research evidence that these particular characteristics make a difference, they do raise a series of issues and challenges for teacher educators and policy makers. In the remainder of this chapter, we illustrate this complexity by focusing on one demographic characteristic, race/ethnicity of teachers, and one quality characteristic, academic ability/achievement of teachers. We choose these two characteristics because we believe they do matter. In one case, the research about the impact of race/ethnicity of teachers on student learning is mixed. In the other case, while the research on the academic ability/achievement of teachers is not conclusive, there is a stronger, more consistent relationship between teacher verbal ability and student learning outcomes. However, the implications of such a relationship pose...
other kinds of challenges for teacher educators and policy makers that could impact the racial and ethnic profile of the teaching force. After considering these two characteristics of teachers, we return briefly to issues raised by the other demographic and quality characteristics of teachers which add further complexity for those hoping to directly and indirectly shape the profile of the teaching force.

Race/ethnicity of teachers

The question here is whether it matters that public school teachers are predominantly White, non-Hispanic (84.3 percent) while the student population is increasingly diverse (42 percent minority). Although minority teachers are more likely to teach in schools serving high proportions of minority and low-income students, even students of color are more likely to have White teachers.

Nationally, the teaching force has ranged from 84 to 92 percent White in the past 30 years, with the highest percentages in the mid-1980s. There is some recent indication that prospective teachers in undergraduate programs are more diverse and that graduate and alternative programs are attracting a higher proportion of minorities. Although the proportion of teachers of color, especially prospective teachers, has increased slightly in recent years, it does not match the increase in student diversity.

There are several factors that appear to have been working against increasing the numbers of non-Whites in teaching. While more minorities are graduating from college, a smaller percentage of African American college graduates now choose teaching than in an earlier era when teaching was one of the few professions open to them (Zumwalt & Craig, 2005a). Besides access to other opportunities, minority college graduates are now actively recruited by higher status and higher paid professions and businesses seeking to diversify their own labor force at all levels. At the same time, in light of the unequal educational opportunities provided many minorities, moves by some institutions and states to raise cut-off scores for admission to teacher education programs and on teacher certification tests have the potential to decrease the pool of minorities who actually enter teaching (Gitomer et al., 1999; Smith et al., 1988; TEA, 1994).

Since there seem to be countervailing societal, economic and political forces over time that have shaped the proportion of teachers of color, one might argue that little can or should be done to try to increase the race/ethnicity profile of the teaching force. However, we believe that there are compelling arguments to take a pro-active stance here even if policy makers and teacher educators have limited ability to alter the demographic profile of the teaching force. If one accepts these arguments, there are considerable challenges for research and practice confronting teacher educators and institutional and governmental policy makers.

Arguments for increasing racial/ethnic diversity

Much of the argument for increasing the racial/ethnic diversity of the teaching force to better reflect the diversity of the student population is predicated on the belief that a diverse teaching force is good for all children, regardless of their racial and ethnic background. The health of our democracy requires attention to the messages children receive about others who are not like them and to providing them with experiences in diverse classroom and school communities. The authority of knowledge should not be seen as the special privilege of Whites, implying the legitimacy of power of one group over all others. Teachers of different races/ethnicities can better prepare children for life in a multi-cultural society committed to equal opportunity.
This prima-facie argument for a diverse teaching force is accompanied by the argument that there are particular benefits for children of color in having a teacher of their own race/ethnicity. Some have suggested that the predominately White teaching force contributes to the continuing “achievement gap” between White students and students who are Black, Hispanic or Native American (Downey & Pribesh, 2004; Farkas, 2003; Ferguson, 1998). The federally mandated No Child Left Behind Act (NCLB) with its specific consequences for not remediying the gap between standardized test scores of different racial and ethnic student groups has raised the stakes for schools and school districts. NCLB, despite its controversial aspects, has heightened attention to increasing the diversity of teachers in our schools and improving the effectiveness of all teachers working with students from diverse races and cultures. As the student population in America’s schools continues to grow increasingly diverse, the necessity for addressing these needs grows even more critical.

Research suggests that same race/ethnicity teachers may act as role models who can instill positive attitudes toward school and provide culturally relevant pedagogy that will also increase students’ chances of academic success (Clewell & Puma, 2003; Dee, 2001; Ladson-Billings, 1992, 1994; King, 1993; NCTAF, 1996). Early studies in this area focused on cultural synchronicity or cultural compatibility of same-race teachers and the extent of which shared language, perspectives, and community values create a classroom climate and relationships that lead to greater academic success among minority students (Au & Jordan, 1981; Erickson & Mohatt, 1982; Irvine, 1990). Other work, most notably the 1994 study by Ladson-Billings, has identified specific pedagogical practices that are linked to effective teaching of African American students. Among these are practices grounded in: a mastery of subject knowledge; an authoritative classroom style in combination with a warm personal relationship; respect for the importance of African American identity and local community values; and high expectations for all students (Foster, 1997; Ladson-Billings, 1994, 1995; Siddle Walker, 1996). (See chapters by Howard and Villegas & Davis in this volume.) While knowledge is accumulating to help teachers and teacher educators understand the diverse needs of their students, many challenges face researchers, teacher educators, and policy makers as they attempt to address these complex issues.

**Challenges for research and practice**

There is much that we do not know. We do not know enough about how the non-representative racial/ethnic profile of the public school teaching force and the uneven distribution of these teachers across regions and schools affects what children and adolescents learn in school and, in particular, what they learn about race and ethnicity in our society. Nor do we know whether and how the racial/ethnic mis-match between individual teachers and students might contribute to inequities in educational achievement for students. These are questions that do matter.

Doing such research is quite challenging, but figuring out what to do with findings that might be uncomfortable might be just as challenging. If we find that certain groups of teachers might be more effective with students in general or students of a particular race/ethnicity (or gender, SES background, or age), what do we do with such a finding? That, however, is not a reason to avoid research of this type nor to conclude that such evidence should be used to support discriminatory policies in admission to teacher education programs or in hiring teachers. It would suggest that efforts to recruit and retain teachers of color be given a high priority.

It also suggests that a focus on how race/ethnicity (and other demographic variables)
relates to teacher knowledge, beliefs and teaching practice might provide new insights into some intractable issues related to student achievement and help teacher educators prepare prospective teachers who can meet the increasingly diverse needs of all students. For instance, research suggests that White teachers who demonstrate teaching qualities similar to African American teachers can be as successful with African American students (Cooper, 2003; Ladsen-Billings, 1994). (See also chapter by Sleeter in this volume.) As mentioned earlier, there is a growing body of literature about culturally relevant pedagogy that can provide teachers with a repertoire of practices that might be more effective with certain learners.

While more research is needed in this area, teacher educators have access to enough knowledge to make all prospective teachers, regardless of their backgrounds, aware that some of their underlying assumptions about teaching and learning emanating from their own experience may be affecting their effectiveness with students who come from different racial, ethnic, and social class backgrounds than they do. The challenge, of course, is that awareness and knowledge do not automatically translate into attitudes and behaviors that make a difference in the classroom. Sometimes the schools where student teachers are placed are not as diverse as might be desired. Sometimes the cooperating teachers reject or dismiss as impractical the ideas about culturally relevant pedagogy or differentiation of curriculum that prospective teachers learn in their teacher education programs. Sometimes teacher educators themselves have not had enough personal or professional experience with students of different racial and ethnic groups to help prospective teachers enact what they are learning about diversity in their teacher education programs. Sometimes the challenges of learning to teach—to manage a class, try out basic instructional strategies, implement the required curriculum—are about all student teachers can handle during their student teaching placements. Sometimes some knowledge about racial and ethnic differences leads to miscues, as the impact of social class background is ignored or research on one sub-group is generalized to all members of the group (e.g. research on Vietnamese immigrant students is seen as applicable to all Asian Americans). Even experienced teachers are challenged by what to do with the growing knowledge about how racial and ethnic differences could and should be accommodated in the classroom to provide all students with an opportunity to learn.

Besides informing teacher educators and prospective teachers about addressing the needs of diverse learners, research about the impact of teachers of diverse racial/ethnic backgrounds could add further impetus to current institutional and governmental policy and program efforts to recruit, prepare, and retain teachers of color. Designing and carrying out effective policies and programs have their own set of challenges. One of the challenges is how these efforts mesh with efforts that focus on raising test scores of prospective teachers as the means to increase the quality of the teaching force.

**Academic ability/achievement of teachers**

The question here is whether it matters that public school teachers have a certain level of academic ability/achievement. As part of teacher education reform efforts, many institutions and states have raised minimum SAT/ACT test scores and/or GPAs for admission into and graduation from teacher education programs, and established or raised cut-off scores for teacher tests required for certification.

Recent interest in quality characteristics of teachers has focused on intellectual competence in comparison to earlier interests in personal qualities and behavioral performance (Lanier & Little, 1986). The most frequently used measures have been academic ability as measured by the SAT or ACT college entry tests and academic achievement as...
measured by college GPA. Also used are the basic skills sections of various teacher tests now utilized primarily for certification purposes, but sometimes for entry or graduation from teacher education programs. Whether these measure ability or achievement is worthy of debate; for our purposes, we are calling them measures of academic ability/achievement.

The belief in the relative inferiority of American teachers is not a new phenomenon (Conant, 1963; Flexner, 1930; Waller, 1932). In “A Nation at Risk,” Americans were warned that “not enough of the academically able students are attracted to teaching . . . Too many teachers are being drawn from the bottom quarter of graduating high school and college students” (National Commission on Excellence in Education, 1983, p. 22). Research indicates that the most academically able are less likely to enter teaching and more likely to leave sooner than their peers (Chapman & Hutcheson, 1982; Kerr, 1983; Sykes, 1983; Vance & Schlechty, 1982; Weaver, 1983).

As we described earlier in this chapter, the dismal portrayal of teachers in the early 1980s has been replaced in the research literature, if not public perception, by a more positive picture over the last twenty years. This improvement probably reflects both the results of teacher education reform efforts and better research methods. Although the general picture is improved, particularly in regard to the finding that lower ability students exit the teacher pipeline at higher rates at each successive stage, there are still some concerns. White teacher applicants have higher passing rates on teacher tests; higher proportions of minorities, particularly Blacks and Hispanics do not pass the tests. Those in the top SAT/ACT quartile are less likely to take jobs as teachers and, once in the classroom, are less likely to stay. Schools serving low-income and minority students are more likely to have teachers from lower SAT quartiles and teachers who are more likely to have failed at least one teacher test (Zumwalt & Craig, 2005b).

Whether these differences in academic ability/achievement have an impact in terms of student learning is not as definitively clear from research evidence as it might seem from the policy imperatives to raise minimum required SAT/ACT scores, GPAs, and teacher test scores. It just seems to make sense that more academically able teachers would be desirable. As Vegas et al. (2001, p. 4) express it, “Teaching well is seen as a complex, cognitive challenge requiring the ability to think and reason clearly.” Smarter teachers are assumed to be better teachers; hence, more able to produce higher student achievement.

Issues related to higher standards for teachers’ academic ability/achievement

Concerns relate to the limitations of standardized tests and GPAs as measures of academic ability/achievement, how to interpret quality profiles and whether a focus on narrowly defined intellectual attributes captures the qualities important for good teaching. A major issue involves the consequences of the push to raise minimum criteria for entry into teaching on the diversity of the teaching force, especially in light of the lack of supporting research evidence demonstrating an impact on student learning.

Measures of academic ability/achievement

Recently, almost universally, researchers offer caveats about the use of SAT/ACT scores as indicators of intellectual competence and the use of GPAs as comparable, credible measures. Heavily correlated with SES, it is debatable whether the SAT/ACT tests actually measure ability or achievement. However, college entry test scores do provide comparable, standardized national data for student cohorts. And unlike teacher test scores,
they provide data for a more inclusive group, not just those preparing to teach. However, the fact that these tests taken in high school are used as an indicator of quality is ironic since their use implies that there is relatively no value added by the college experience or at least that students graduate from college with the same relative abilities with which they entered. The relative ease of collecting SAT/ACT scores, GPA information and other basic skills test scores, however, means that they will remain the most frequently used measure of intellectual competence of teachers, despite their acknowledged limitations.

**Interpretation of quality profiles**

Concern has been expressed that teacher candidates from the top quartiles of SAT/ACT scores are less likely to take teaching jobs since they are more likely to continue with graduate education or pursue more attractive career options. Once teaching, those in the top quartile are more likely to leave.

This raises questions about realistic expectations for the ability profile of teachers. As Lanier and Little (1986) point out, the annual demand for teachers means that even if all the top quintile of college graduates went into teaching, there still would not be enough teachers for our nation’s schools. Obviously, it is unrealistic to expect all top college graduates to become teachers, particularly since there are so many higher status, higher paid careers that are open to them, many of which also need highly able people.

So what would an appropriate profile look like? Should any students in the bottom quartile be permitted to become teachers? Should the ability distribution of teachers match the ability profile of all college graduates? Or should it match the distribution of college graduates going into medicine, law, architecture, business, social work, journalism, nursing? Lack of comparable data with other professions limits our ability to interpret appropriate expectations for the ability profile of teachers.

Comparisons with other professions might provide some realistic expectations for the teaching profession, but the question remains about how much it matters in terms of teacher practice and student learning. There is no empirical evidence indicating what GPA (which is extremely sensitive to institutional variability), SAT/ACT scores and teacher test scores are minimally acceptable in terms of teacher performance and student achievement. Cut-off scores are largely based on what politically and intuitively seem like a minimal level to convey a message of quality and provide an adequate number of qualified teachers of diverse backgrounds for an institution or state. There is always the danger that cut-offs may keep effective teachers out of classrooms and give a false sense of confidence about those who are teaching. Predictive validity studies of GPAs, SAT/ACT scores and teacher cut-off scores in terms of teacher performance and student achievement are needed to see at what level they really do matter.

**Definition of quality**

The intellectual ability of teachers, although it has not been definitely tied to teacher practice and student outcomes, has long dominated discussions of the quality profile. The transition of teacher preparation from normal schools to colleges and universities, not completed until 1940, was not easy because the public perception of normal schools and teachers had been shaped “by the intellectual limitations then commonly believed to be inherent in the female sex” (Lagemann, 2000, p. 6). Although teachers’ intellectual competence was questioned, they were seen as possessing compensating personal qualities such as “altruism or idealism . . . in abundance” (p. 16). The perceived intellectual
inferiority of teachers and education as a field of study helped make standardized test scores the most used indicator of quality.

When Dewey spoke of the “intellectual equipment” of teachers being key to the success of teaching, he was not referring to college entrance tests. “[I]t is a question of not only what is known, but of how it is known” he said (1902, p. 398). As he noted,

... just in the degree in which the teacher’s understanding of the material of the lesson is vital, adequate and comprehensive, will that material come to the child in the same form; in the degree in which the teacher’s understanding is mechanical, superficial and restricted, the child’s appreciation will be correspondingly limited and perverted.

(PP. 397–398)

Understanding and appreciation of subject matter and pedagogy are other aspects of intellectual competence critical to teaching. However, such knowledge is not captured in current quality profiles of teachers based on college entry tests. Even more broadly defined, intellectual competence would not be sufficient for quality teaching. Some prospective teachers from the highest quartile decide not to teach after struggling in student teaching with learners for whom school is not as easy as it was for them. Some, encouraged by others because they are “good with kids” find the organizational and intellectual challenges of teaching overwhelming. The reality is that teaching requires a mix of intellectual and personal qualities. As Howey and Strom (1987) suggest:

Given the complex, interactive and moral nature of teaching and the rapid changes and diversity in schools (and in society), we maintain that the professional preparation of teachers should have as its basic goal of development of teachers as persons who have conceptual systems characterized by the qualities of being adaptable, questioning, critical, inventive, creative, self-renewing and oriented to moral principles.

(p. 8)

Needless to say, profiles based on assessment of all these qualities do not exist. Figuring out how to collect valid measures of such data about large numbers of college students would be a major challenge. Given these challenges and the public’s less complex vision of teaching, it is likely that quality as measured by text scores will continue to dominate research and policy.

**Impact on diversity**

Raising minimum academic standards for teachers appears commonsensical if the aim is to increase quality of teaching in our schools and to raise the public perception of teaching. Yet, because of inequities of educational opportunities for students in this country, there is tension between the goal of increasing the diversity of the teaching force and the goal of increasing the quality profile of teachers by establishing higher GPA, SAT/ACT scores, and teacher test scores for admission, graduation and certification. The effect of raising minimum cut-off scores raises the quality profile but may restrict the diversity of the teaching force. Since a diverse teaching pool is seen by many as a critical element of a quality teaching pool, the raising of minimum cut-off scores can be seen as having contradictory influences on quality.

The need to provide an adequate number of teachers for our nation’s public schools
also places parameters on the setting of minimum standards. Within these parameters, the tension between the two goals of quality and diversity is undoubtedly the major issue facing teacher educators and policy makers in relation to setting minimum academic standards.

In conclusion, whether these measures of academic ability/achievement make as much difference as the public thinks, they will still make a difference in terms of the public image of teaching which affects support for education and helps influence peoples’ decisions about entering and staying in teaching. The potential impact on the diversity of the teaching force is a sensitive topic not receiving the attention it deserves. It must also be remembered that larger social and economic factors, the ethos of the occupation and the structure of schools also shape the quality profile of the teaching force by affecting interest in teaching, the selectivity of teacher education and alternative programs, whether and where teacher candidates decide to teach, and how long they stay.

Demographic and quality characteristics

In this chapter, we have focused on one demographic and one quality background characteristic of the teaching force to illustrate the complexity of the issues in relating them to student learning. Regardless of the status of research surrounding them, the racial/ethnic diversity of the teaching force, the academic ability of teachers and the interaction between them are issues that do and should matter to policy makers, teacher educators, and the public. The other background demographic and quality characteristics are also important in themselves and also in how they interact with ethnicity/race and academic ability/achievement. While space prevents full consideration of these other characteristics here (see Zumwalt & Craig, 2005a, 2005b) we want to end by briefly noting some of them.

Even if the research indicates that gender imbalance has little or no impact on student achievement as measured by test scores, some believe that gender diversity is not only intrinsically valuable, but important for the symbolic messages it sends about teachers and education. The perception that teaching is a “female” career is seen by some as having a negative impact on efforts to improve working conditions and the status of the profession, as well as possibly discouraging half the population from considering teaching when making career decisions. We do not know enough about the impact of gender on other student outcomes nor its interaction with other variables such as race/ethnicity and SES background of teachers. For instance, minority male teachers, serving as role models, may have a differential impact on low-income minority males’ persistence in school.

We know the least about teachers’ SES background and how it may affect their teaching practice and student learning. Teachers from different SES backgrounds may bring different knowledge, attitudes, and practices to the classrooms that affect students differentially. For policy makers, SES background may matter in terms of recruitment strategies, while for teacher educators it may matter in terms of their program. The SES background of teacher education students is likely to be highly correlated with the quality and types of teaching they experienced in their own K-12 education (Popkewitz et al., 1982). Such knowledge could affect the content and strategies teacher educators use in their programs if they want students to enact teaching that goes beyond that which they have experienced as students.

Teacher educators—in undergraduate, graduate, and alternative programs—are all working with students older than the previously typical 18–22 year old college students. Undergraduates are taking more than four years to complete their programs and older
adults, many with parenting experience, are returning to college to start or complete their bachelor’s degrees. Graduate and alternative programs are designed for older adults who did not prepare for teaching in college; these prospective teachers range from new college graduates to retirees. Age is not a perfect proxy for maturity and experience, but if the candidates are getting older, teacher educators might want to reconsider elements of preparation programs that were appropriate for unmarried, college-age students but less so for older students with children of their own. Also, as the age of prospective teachers increases, the initial attractions of teaching, as well as future career paths, change. The ubiquitous linear connection between teacher age and attrition labeled the “U-shape” phenomenon by researchers may be modified. Teacher educators need to become familiar with the expectations and career decisions facing older adults preparing to teach.

Whether age matters may depend on how it interacts with experience. While research linking teacher experience with student achievement has been inconsistent, generally a relationship is most evident in the early years of teaching at the elementary level and a longer effect at the secondary level (Rice, 2003). Regardless of research findings, the aging of the teaching pool has been cause for both concern and celebration. On the one hand, the greater maturity, experience, and stability of the teaching pool and the ability of graduate and alternative programs to attract older candidates are viewed as positive. On the other hand, the “graying” of the teaching pool is seen as alarming—too many burned out teachers holding on to old (e.g. progressive or traditional) ways of teaching, resisting new demands for accountability. The differential distribution of young and inexperienced teachers, with their typically higher attrition rates, in urban schools serving low-income, minority students is one particular concern seen as a contributory factor to the persistent achievement gap.

While the ability/achievement of teachers has dominated public discussion and research, other indicators of background quality characteristics of teachers also need attention. Whether or not there is ever research evidence that supports a content major instead of an education major (Floden & Meniketti, 2005), it has face validity for policy makers and the public. It serves the purpose of seeming to upgrade teacher quality, whether or not it improves the academic ability profile of teachers, affects the quality of their preparation or makes them better teachers.

The unequal distribution of other background quality indicators, besides academic ability and achievement, raise questions that matter. Teachers who attend less competitive colleges are more likely to teach non-White, low-achieving students and more likely to have failed one teacher test (Lankford et al., 2002). Public schools with higher proportions of minority or low-income students are more likely to have uncertified teachers and teachers teaching “out-of-field” (Darling-Hammond & Cobb, 1996; Henke et al., 1997; Ingersoll, 1996; Zeichner & Schulte, 2001).

Whether certification matters is increasingly debated as the struggle between professionalization and deregulation takes center-stage and in light of federal legislation requiring all classrooms to be staffed by “qualified” teachers. A major challenge in using it as a quality indicator is that each state has different certification requirements and multiple certificates. What one can say is that being “certified” is an indicator of what a particular state deems as its minimal “safe to practice” criterion. Complexity is added when different criteria are used to judge “out-of-field” teaching—most may be certified to teach, but not necessarily to teach all the courses they are assigned to teach. To meet new standards for “qualified” teachers, sometimes definitions of who is “certified” have been adjusted to include those who previously would not have been labeled certified.
CONCLUSION

While the research evidence about the impact of the background demographic and quality characteristics discussed in this chapter on student learning is not overwhelming, hopefully, our consideration of the issues leaves the reader with the sense that the demographic and quality profile of the teaching force does matter.

In highlighting one demographic characteristic—the race/ethnicity of teachers—and one quality indicator—the academic ability/achievement of teachers—it becomes clear that these two highly salient characteristics actually both contribute to the quality of the teaching force. A diverse teaching force, desirable for a variety of intrinsic and extrinsic reasons, itself becomes a quality indicator.

Seen in this light, the seemingly obvious goal of raising minimum standards of academic ability/achievement of teachers that may restrict the diversity of the teaching force creates a tension not just between quality and diversity, but really a tension between different aspects of a quality teaching force. With all the issues associated with measures of quality discussed here and the lack of definitive evidence indicating the impact of certain test scores and GPAs, the rationale for further increasing cut-off scores on these measures of academic ability/achievement is questionable. Additionally, as Rivkin et al. (2005) conclude, there is such substantial difference in quality among those with similar traditional quality attributes (e.g. masters degree, experience), that focusing policy in the hiring, mentoring, firing and promotion at the school level probably makes more sense than adjusting state cut-off scores.

Whether policy makers and teacher educators can do much to substantially change the demographic and quality profile in light of larger social forces is debatable. However, that does not absolve them from taking a pro-active stance on one of the major issues—the consequences of a predominantly White teaching force and a growing minority public school population. While efforts to recruit and retain more teachers of color are certainly desirable and should be accelerated, so should the efforts to understand how race and ethnicity relate to teachers’ beliefs, knowledge, and classroom practices in order to prepare teachers who can better meet the diverse needs of all their students.

Teachers of color
Quality and effective teachers one way or another

Mary E. Dilworth
National Board for Professional Teaching Standards
Anthony L. Brown
University of Texas at Austin

AN ENDURING QUESTION

What is the inherent value of teachers of color—to the teaching force, to society and most importantly to students? These questions are asked today in somewhat the same manner as they were posed more than a century ago. Do these teachers provide a necessary service to the students and communities? Is their training, knowledge or ability consistent with that of other teachers? Is there a value-added dimension in their craft wisdom? Yes. We argue that teachers of color have made and continue to make a substantial contribution to the quality of instruction and student achievement in this nation. We understand that teachers of color frequently teach with a greater level of social consciousness than others. This difference, along with imposed and self-imposed responsibilities, is prompted by a commitment to the maintenance or assimilation of cultures, racial uplift, and socioeconomic necessity and survival.

In this chapter, we describe how the presence, preparation, and practice of African American, Hispanic, Asian American and Native American teachers has been addressed in the literature and perceived in society. Our discussion is premised on the notion that the role and treatment of all teachers has changed over time, but these changes do not influence teachers of differing racial/ethnic and linguistic backgrounds in the same way. We begin with a historical overview of the educational experiences of African Americans, Mexican Americans, Chinese Americans and Native Americans. We then offer observations on similarities in the perceptions of these groups toward schools, the curriculum and the role of teachers of color. We include discussion of contemporary enduring issues that build on this history.

THE AFRICAN AMERICAN HISTORICAL CONTEXT

The expectations and practices of African American teachers during the late nineteenth century and early twentieth century have been duly noted by educational historians (Anderson, 1988; Fultz, 1995a; 1995b). This literature consistently illustrates that the African American teacher was a central figure of discussions regarding the educational and social progress of African Americans. Indeed, the historical period and region of the country made for varied aims and contexts for African American education, yet the educational discourse regarding the role and expectations for the African American
teacher has remained quite stable. In fact, there has been a rather persistent discussion since the early nineteenth century and continuing to the present, relating to issues surrounding the role and expectations of African American teachers working with African American students (Campbell, 1970; Dubois, 1935; Lynn, 2002; Mabee, 1979).

For example, during the late 1800s in the state of New York, African American educators, community leaders and parents advocated for school officials to hire African American teachers to teach African American students (Mabee, 1979; Rury, 1983). Advocates for such a change contended that African American teachers could serve as role models to incite African American students to succeed. After Reconstruction, similar arguments supported the idea that the African American teacher could serve as a pillar of “moral righteousness,” social uplift and educational excellence (Fultz, 1995a).

Embedded in such an argument was a belief that African American students would better comprehend the value and importance of education by hearing, seeing, and learning the implicit and explicit messages of “education for social uplift,” from a person of their racial background.

**Historical arguments for African American teachers, 1805–1900**

In 1789, the New York Manumission Society founded the New York African Free School to serve the growing population of free African Americans to the area (Rury, 1983). The board of trustees from the Manumission Society insisted that by teaching the free African American child and adolescent about different aspects of “sobriety” and “industry,” “they could make them more orderly and tractable as they emerged from slavery” (Rury, 1983, p. 187). Through the late 1800s, mostly White teachers taught at these schools. However, during this period there was an emerging debate about whether Black teachers would better serve the mission of educating the African American child. For example, in 1805, members at the American Convention of Abolitionist Societies declared that African American children would benefit from the instruction of African American teachers. At the convention, members maintained that the instruction of African American teachers would “kindle a spirit of emulation” in Black children (Mabee, 1979, p. 93). In addition, historian John Rury (1983) found that Black parents consistently declared to the Manumission Society the importance of Black teachers educating their children. Through the late 1800s and 1900s there were also countless arguments made at local districts in the North, and after Reconstruction, in the South, for the importance of Black teachers educating Black children (Blackshear, 1969 [1922]; Mabee, 1979). This quote from noted African American educator E. L. Blackshear (1969 [1902]) highlights a common sentiment about why African American teachers could best serve the specific needs of Black children:

> The colored teacher has been a herald of civilization to the youth of his people. His superior culture and character have acted as a powerful stimulus to the easily roused imagination of the colored youth, and the black boy feels the presence of the black “professah,” to him the embodiment of learning, that he too can be “something.” At first he does not know what that something is, but he determines to be “somebody” and to make a place and a standing for himself in the world.

(p. 337)

While this quote reflects a common argument made about the practice and value of Black teachers, African American educators and leaders simultaneously expressed the importance of African American teachers receiving “proper” educational training (Bond, 1934;

**Early arguments for African American teacher training**

During the decades immediately following the Civil War, the nation moved cautiously towards educational access for children of the poor and working poor as a means to advance society. Once the merits of an elementary level education were established, local communities, particularly in the North, worked to determine minimum academic standards that suited their vicinities (Grant & Murray, 1999). In contrast, the segregated South was obstinate in using public education as a vehicle to move their community forward and consequently offered limited academic opportunity for its citizens. African American children of former slaves were especially perceived as expendable for reasons other than labor; consequently, the poor conditions of their schools were of little interest to the majority population and were unsupported by their jurisdictions. Thus, southern rural schools for African American children were established, financed and supported by and large by Northern philanthropic organizations and churches of various denominations. For instance, the Jeanes teachers, a corps of African American and White teachers financially supported by the General Education Board, are frequently noted in the literature for their efforts in the rural south. Their work was intended to improve the knowledge and skills of African American teachers operating in isolation (Tillman, 2004). Indeed, reports of over-crowded, grade-less classrooms, minimal supplies, books and other resources, were surpassed only by reports of teachers who themselves had received very limited and inadequate educations.

African American educators insisted that teacher training for Black teachers would provide more “competent professionalism” and “improved instruction” (Fultz, 1995b). For example, Fultz (1995b) found that several Black state teacher associations, including the National Association of Teachers in Colored Schools, “carried the banner of improved training and instruction” (p. 205). In addition to the growing interest of African American colleges to provide rigorous instruction and professionalism, some sociologists and educational scholars (Bond, 1934; Caliver, 1933; Johnson, C. 1930) adamantly expressed that the future of Black education was incumbent upon the advanced pedagogical training of Black teachers. For example, sociologist Charles Johnson, in his assessment of the educational conditions of African American children in rural schools, contended that, “these poorly trained teachers . . . will inflict the accumulated deficiencies of the system in which they have been trained upon their pupils, and so perpetuate it” (Fultz, 1995b, p. 197). Educational scholar, Ambrose Caliver, who conducted one of the first comprehensive studies about the education and training of African American teachers, also suggested that African American education could not progress unless changes occurred in the selection and training of African American teachers. The following are two of his recommendations:

- Teacher-preparing institutions for Negroes should raise their entrance requirements, making them more selective, and should improve their admission procedures in order to assure to the teaching profession recruits with better background and preparation.
- More attention should be given by school officials to the qualifications and certification of Negro applicants, and appointments should be made solely on merit.

(Caliver, 1933, pp. 117–118)
Therefore, while there was strong advocacy for Black teachers’ social practices (i.e., community leadership and role modeling), African American educators consistently argued that improved educational outcomes must equally occur through sound educational training and professionalism.

At the advent of the landmark *Brown v. Board of Education* Supreme Court decision, historically Black colleges and universities (HBCUs) were solely responsible for the preparation of African American teachers for segregated “Negro” schools (Groff, 1961, p. 8). Groff, in a survey reported approximately 5 years following the *Brown* decision, found a general sense of optimism among responding HBCUs in the south. The majority of respondents indicated that they did not anticipate a decrease in enrollments or a reduction of financial support. They did anticipate greater competition among students and better pre-college preparation of students. According to Groff (1961), one respondent reported, “this would raise academic standards, better social manners and speech habits and help reduce the need of removing undesirable feelings toward White people” (p. 10). Groff (1961) further reports that HBCU administrators felt that their teacher education students had a stronger urge to achieve and make greater contributions to uplifting the race through education. Their students also had greater anticipation of the challenges of future employment opportunities, of professional welfare and advancement, and “less obsequiousness” (p. 10). Lastly, HBCUs exhibited greater pride in preparing teachers and providing “quality preparation.”

**Closing thoughts on history: African American teachers**

Much of the early debates and discussions about the roles and responsibilities of African American teachers emerged out of larger political concerns of racial and social justice. While racial and cultural identification was a central argument made for the placement of Black teachers in African American classrooms, several African American educators and scholars expressed a deep concern that African American teachers must also receive sound instructional training in order to effectively address the educational needs of African American children. Fultz (1995b) summarizes, “[T]he fate of the race depended on the types of schools it had, the types of schools Blacks possessed depended on the quality of the teacher available to them, and the quality of the teachers depended upon sterling character and professional training” (p. 197). In summary, while the historical contexts of the debate for Black teachers have changed since the early 1900s, recent educational literature reveals the sustained political nature of discussions about whether Black teachers can best serve the educational needs of African American students.

**AMERICANIZATION AND LATINO EDUCATION**

The ideological practice of “Americanization” during the mid-1800s had an immediate impact on the educational experiences of Latino communities (San Miguel & Valencia, 1998). “Americanization” was a political movement that aimed at teaching, acculturating and educating U.S. economic, political, religious, and cultural forms. San Miguel and Valencia (1998) point out that “Americanization” was not undertaken just to inculcate “American” ways, but also to discourage the maintenance of a “minority group’s” own culture (p. 358). In the case of Mexican Americans, public school officials instituted “Americanization” practices by banning the use of Spanish in schools and the removal of all content and pedagogical practices associated with Mexican culture. Certainly, such policies did not affect every state in the nineteenth century. However, by the early
twentieth century, English-only policies became common practice throughout most Western and Southwestern states. San Miguel and Valencia (1998) argue that the effort to remove Spanish and Mexican culture from the schools was part of a national campaign against diversity. These authors state, “The primary goals of this campaign were to promote the purity of Anglo-American culture, [and] unify the country on the basis of a common culture and language” (p. 361).

Despite such practices, however, various Mexican American and Latino communities developed educational and social interventions to meet the needs of Latino communities. For example, several educational historians (DeLeon, 1982; San Miguel, 1987; San Miguel & Valencia, 1998) note that from the late 1800s through the early 1900s, there were several examples of Mexican and Latino teachers and educators who worked to meet the specific educational needs of Spanish-speaking children.

Exclusionary practices and Latino teachers

Richard Valencia (2005) argues that *Mendez v. Westminster*, a 1946 class action suit on behalf of 5,000 California Mexican American students was an important precursor to the *Brown* decision. He notes that “Racial/ethnic isolation of school children was a normative practice in the Southwest, despite the fact that these states had no legal statutes by which they could legally segregate Mexican American from White students” (p. 394). However, despite such exclusionary policies including English-only instruction and curriculum, Mexican American community leaders as early the late 1800s, opened their own schools and hired Spanish-speaking teachers of Mexican and Latino descent, to meet the cultural and linguistic needs of Latino students (DeLeon, 1982). One case occurred during the late 1800s, when several Tejano1 communities in El Paso opened schools with Spanish-speaking teachers who taught Mexican children to become literate in both English and Spanish (DeLeon, 1982). Another example was during the 1880s, when Mexican American parents developed a school to teach English to Mexican students with limited English proficiency because the local El Paso school officials refused to teach English to Spanish-speaking students. The community turned to an elderly man named Olivas Villanueva Aoy, who agreed to open a private school with the sole purpose of teaching Mexican children English to prepare them for public schools. Historian Mario Garcia (1981) notes that by the 1890s, Aoy, with the help of two Mexican assistants, was able to teach close to one hundred first and second graders. Such examples, according to DeLeon (1982), illustrate how Spanish and Mexican teachers and parents persistently fought against exclusionary educational practices. This type of determination was also apparent in the political and social practices of Hispano2 communities in New Mexico. In fact, by the early 1900s, some Latino community leaders and educational advocates were able to gain support for teacher training programs for Latino teachers working in rural Spanish-speaking regions.

Teacher training and Latino teachers

During the early 1900s in New Mexico, after the Hispano community established political influence in the region, they were able to develop a bilingual teacher training school named the “Spanish-American Normal School at El Rito.” In 1909, Latino leaders Veneslao Jaramillo and Solomon Luna, joined forces with the former territorial governor L. Bradford Prince, to lobby for a normal school to be opened for Spanish-speaking teachers (Getz, 1997). The purpose of the school was to educate, “Spanish-speaking natives of New Mexico for the vocation of teachers in the public schools of the counties
and districts where the Spanish language is prevalent” (MacDonald, 2004, p. 120). By 1918, over one hundred future teachers enrolled in the teacher-training program, with it eventually becoming part of the New Mexico higher education system.

Getz (1997) argues that some teacher training efforts for Hispano communities only served to enhance the already accepted roles of teachers as “community leaders, role models, and members of community networks” (Getz, 1997, p. 90). However, despite such community advocacy, university scholars insisted that if Latino teachers received more training in “new ideas and advanced teacher methods,” they could better serve the educational needs of rural Hispano children (Getz, 1997, p. 92). For example, during the 1930s, with the political and social aims of the New Deal and philanthropic organizations such as the General Education Board, University of New Mexico teacher educator and social activist Lloyd Tireman was able to pursue educational reform efforts such as the San José school, to provide rural Spanish-speaking teachers exposure to new teaching methods (Getz, 1997). Tireman tirelessly reiterated the benefits of Latino children receiving instruction in their “mother tongue”; however he also argued that such teachers would also require training in advanced pedagogical practices (Getz, 1997, p. 74).

As a way to provide such training, Latina teachers were awarded scholarships to attend the College of Education at the University of New Mexico. There, they too learned methods thought necessary for learners to thrive in a rural school context. In addition, the teachers regularly attended “demonstration schools” to observe models of instruction that they could transfer to their own school sites. As a whole, “progressive” educational philosophies guided the efforts to train community teachers, drawing from the assumption that the combination of sound instructional training and the culturally congruent instruction offered by Latina teachers would have a profound impact on the rural education of Hispano students.

### Closing thoughts on history: Latino teachers

As several historians illustrate, the efforts of Latino teachers were at the center of social change for Latino communities during the late nineteenth century and early twentieth century (DeLeon, 1982; Garcia, 1981; MacDonald, 2004). Although the ideological practice of “Americanization” became a common educational approach in California, Texas, and Southwestern U.S. schools, the efforts of Mexican and Latino teachers consistently served to meet the specific cultural and linguistic needs of Spanish-speaking children. Additionally, these histories illustrate that the issues over cultural synchronization and relevance were critical in discussions about education for Mexican and Latino communities as early as 1850. Indeed, as subsequent history would tell, issues of language maintenance and cultural competence have remained a central debate within educational discourse for Latino and Hispanic communities.

### THE HISTORICAL CONTEXT OF CHINESE AMERICANS

The educational experience of Asian Americans provides one of the earliest accounts of how race, culture, and language shaped the practice of teaching. The case of Asian Americans historically illustrates how various exclusionary practices in the U.S. led to the call for alternative educational interventions in meeting the social and cultural needs of Asian American students. For example, the early history of Chinese Americans reveals how immigration laws and anti-Asian sentiment catalyzed community efforts at developing language schools with teachers of Chinese descent. Although there is a dearth of
historical literature about the specific practices of Chinese-American teachers in language schools in the U.S., some of the available literature illustrates how various exclusionary practices and racial discrimination led to the development of language schools. More importantly, some of this literature discusses the cultural and pedagogical relevance of Chinese-American students having teachers from their specific cultural and linguistic backgrounds.

Chinese-Americans in the U.S.: migration and exclusion

The history of Chinese Americans reads much like an epic novel, filled with long journeys, dreams, ambitions, struggles and perseverance. The story begins during the mid-1800s with the rapid increase of Chinese immigration to the United States. Daniels (1988) notes that between 1849 and 1882, a little over 300,000 Chinese immigrants arrived in the U.S. By the late 1870s, it was quite clear that the new Chinese immigrants had become an integral and vital part of the labor force. However, what started out as a journey for Chinese immigrants filled with possibility, was quickly decimated by increased levels of nativism from labor leaders, politicians, journalists, and school board officials.

Anti-Chinese sentiment: schools and society

Although there were nationwide economic hardships during the 1870s, the working people of California tended to place the blame for these hardships on the presence of Chinese workers. Such an atmosphere helped to influence anti-Chinese legislative practices in California at the state and municipal level. Thus, at the state and municipal level, a number of absurd ordinances were passed to drive the Chinese immigrants to other states. For example, the California state legislature passed an act that prohibited Chinese “to land without a bond unless they could convince the State Commissioner of Immigration of their ‘good character’” (Daniels, 1988, p. 38). Similarly, at the municipal level, California cities such San Francisco also passed capricious ordinances to drive the Chinese immigrants to other states. For instance, because Chinese families generally had to live in cramped housing in “Chinatown,” the city of San Francisco passed the Cubic Air Ordinance calling for tenants to have at least 500 cubic feet of air for each inhabitant. To no surprise, under this ordinance, Chinese residents received several citations, but not the White property owners (Daniels, 1988). This atmosphere of anti-Chinese sentiment led to the eventual passing of the Chinese Exclusion Act of 1882, which barred the immigration of Chinese laborers for ten years (Kitano & Daniels, 2001). In California schools, similar exclusionary practices existed, having a significant impact on the early educational experience of Chinese American children. In 1857, the San Francisco school board rejected the request of Chinese leaders to admit Chinese children into the public schools. The following year, the school board allowed Chinese students to enroll, but only at the segregated African American school. The Chinese parents refused, arguing that they would only attend schools integrated or segregated for Chinese (Weinberg, 1997). For close to ten years, the school board continued to open and close temporary quarters specifically for Chinese students. Although Chinese leaders persistently complained to the school board about such inequitable treatment, the school and governmental authorities continued to ignore Chinese leaders’ consistent appeals to enroll Chinese students in San Francisco public schools. The U.S. governmental authorities even ignored the provisions of the Burlingame Treaty of 1868 that “required the public educational rights of citizens of both countries [United States
and China) be respected while those citizens resided in the other country” (Weinberg, 1997, p. 18). In addition, the United States government ratified the treaty stating that their only responsibility was to “protect all Chinese subjects from abuse and mistreatment” (Weinberg, 1997, p. 18). By 1871, the state authorities had developed exclusionary laws that claimed that Chinese American children had no legal claim to education, and subsequently Chinese American students were barred from public schools from 1871 to 1884 (Weinberg, 1997). However, this did not mean that Chinese American children went without schooling. In fact, for families that wished to have their children in an educational setting less hostile to Chinese culture, they generally placed their children in Chinese-language schools.

**Chinese-language schools and teachers**

Chinese language schools were small, privately operated, and maintained by Chinese immigrants. These schools were called *kuan* in Chinese, meaning, “[A] private institute under the supervision of a tutor” (Morimoto, 1997, p. 11). Chinese-language schools generally enrolled twenty to thirty pupils ranging in age from seven to eighteen. In many of the schools, classes were taught on weeknights, and they provided instruction in subjects such as Confucian classics, Chinese language, philosophy, calligraphy, and poetry. Chinese educators focused the curriculum on the traditional values, language and culture of China as way to buffer the racism Chinese American students faced in schools and society. Here, Chinese scholar Kim-Fong Tom (1941) elaborates on the necessity of Chinese-language schools:

> Chinatown has been described by some American writers as a place of opium dens and gambling houses. The pulp magazines and some motion pictures have served to keep this illusion alive. Even today, many Americans still have the notion that [Chinese] people are inferior and backward. Living in a country where the Chinese have been looked down upon and ill-treated, it is easy for them to develop inferiority complexes. To prevent the children from falling into conviction, it is necessary for them to have a correct knowledge of China and the Chinese civilization.

(p. 559)

Tom (1941) further pointed out that the Chinese-language school helped to instill in students a rich and positive appreciation of Chinese ancient culture and respect for their race. Besides instilling racial and cultural pride, Tom (1941) also argued that Chinese-language schools helped students negotiate their new cultural context of being both Chinese and American. Along this same vein, Louis (1932) suggests that because Chinese American students had to learn how to negotiate Chinese and American culture, leaders from the Chinese community should help students with strategies for accommodating the cultural worlds of United States and China. Chinese teachers served such a purpose.

The Chinese-language teachers were generally well-educated community leaders who had the capacity to help Chinese American students negotiate their social and educational worlds of being both Chinese and American. During the 1930s, sociologist Francis Chang (1934) argued that although there were conscientious non-Chinese teachers in public schools, he felt that they did not “understand the children’s language, home conditions, and future cultural and vocational possibilities” (p. 542). He further pointed out that Chinese teachers in Chinese-language schools had an advantage over public school teachers, because the Chinese teachers spoke the children’s language and had the capacity to approach parents more readily. As a whole, the discussion about
Chinese teachers focused on aspects of culture and race. Given the onslaught of racial antagonism towards and exclusion of Chinese Americans during this period, Chinese-language schoolteachers appeared to serve three central purposes: (a) maintaining the culture and language of Chinese tradition; (b) countering negative stereotypes and racial images of the Chinese community; (c) helping second-generation Chinese-American students negotiate Chinese and American culture. Given the context of anti-Chinese sentiment, it seems fair to argue that Chinese teachers at this time fulfilled not only a linguistic or cultural gap, but may have also served as advocates of social change for Chinese American students. The history of Chinese American education therefore, illustrates one of the earliest accounts of Asian American teachers for Asian American students.

Closing thoughts on history: Chinese American education

The educational experience of Chinese Americans illustrates that the discussion around cultural synchronization and teaching is hardly new. Many of the questions asked in the contemporary literature about Asian American teachers parallel the concerns of Chinese families and community leaders during the late nineteenth and early twentieth century. During this period, the concerns of culture, language, and tradition were all key arguments for having teachers of Chinese backgrounds. Another central concern during this early history was the effect that anti-Asian sentiment would have on the self-worth of Chinese second-generation children. The role of the Chinese teacher was to provide a positive image of the culture and infuse children with a sense of racial and cultural pride to buffer against the ideological practice of U.S. schools and society. In recent years, educational scholars concerned with education of Asian-American students have continued to explore these issues. The question that remains is: What impact does having a teacher of an Asian American background have on the social and educational development of Asian American students?

THE HISTORICAL CONTEXT OF NATIVE AMERICAN EDUCATION

Historians have consistently argued that the education of Native American students during the late nineteenth and early twentieth century was unquestionably a movement toward cultural annihilation (Adams, 1995; Coleman, 1993; Szasz, 1999 [1974]). Much of this literature asserts that the discussion of Native American education in the 1880s emerged out of a theme of educating Native Americans to "save" the Native American (Adams, 1988, 1995; Lomawaima, 1993). This theme of "saving" was based on an ideological belief that Native American culture was "inferior" and "savage," while White protestant culture was "superior" and "civilized." Therefore, education for American Indians served to remove all aspects of Native American language, culture, and traditions, with the ultimate aim of total assimilation into "American-Protestant" culture (Adams, 1995; Reyhner & Eder, 2004; Witmer, 1993).

Education for cultural annihilation

During the late nineteenth century, it was quite clear that the aims of education for American Indian children served one purpose—Americanization (Adams, 1988; Lomawaima, 1993). White educators proposed three specific aims to meet this goal:
(1) academic development, (2) individuation, and (3) Christianization (Adams, 1995, pp. 21–23). According to Adams (1995), one of the first priorities of educating the Native American child was to ensure that she/he could read, speak and write the English language. Mastery of such skills, according to White school officials, was a measure of acquired “civilized knowledge.” However, White educators insisted that in order for Native American children to internalize school knowledge, they had to develop an individual identity disconnected from their tribal identities (Adams, 1995; Lomawaima, 1993; Reyhner & Edner, 2004). One strategy used to foster individual identity was to separate students from their families and siblings—and in some cases separate them from all American Indians (Reyhner & Edner, 2004). Another pedagogical strategy employed to assimilate the Native American child was to Christianize their spiritual beliefs (Lomawaima, 1993). School officials insisted that the Native American child would reach the highest level of social evolution through a firm foundation of Christian morals. Again, this aim emerged because of ensuing beliefs among White school officials that American Indian religious practices were hedonistic and “savage,” while Christianity was a “civilized” spiritual practice. In short, through the process of academic development, individuation and Christianization, White educators sought two purposes: (1) to deculturate the tribal identity of the Native American child, and (2) to acculturate them to White Protestant ways of thinking and living (Coleman, 1993, p. 53). Certainly, such a schooling context did not come without its share of student resistance.

Native American students’ resistance started first with their deep resentment toward the schools for pulling them away from their families. Students resisted in a variety of ways such as running away, day-to-day protests of school policies and in some cases, burning down buildings (Coleman, 1993). Other forms of resistance included, “willful acts of defiance, disruptive pranks, ‘work slow downs,’ refusing to participate in competitive exercises, and perhaps most common, adopting a general posture of nonresponsiveness” (Adams, 1995, p. 231). In addition to students’ persistent direct and indirect challenges to both policy and curriculum, the growing presence of Native American teachers at American Indian boarding schools during the early twentieth century, implicitly and explicitly helped Native American students to cope within a school context that devalued American Indian culture.

**Historical perspectives on Native American teachers**

Although much of American Indian education was clearly Eurocentric during the late nineteenth century, some White educators introduced the importance of including the cultural and linguistic backgrounds of Native American students, including the benefits of having a teacher of American Indian descent. For example, in 1886, Elizabeth Peabody, the famous Boston educator, spoke of Native American teacher Sarah Winnemucca’s qualifications:

> The only vital education that can be given to Indians must be given by Indians themselves who have spoken both languages from childhood, and are able to ground their methods, as she [Winnemucca] does, upon their own inherited natural religion and family moralities.

(Gere, 2005, p. 6)

Peabody arrived at such insights directly from Sarah Winnemucca’s work at the Peabody Institute for Native American students. Educational historian Ann Ruggles Gere (2005) notes that during the four-year history of the school, Winnemucca was able to create a
learning environment that affirmed American Indian culture while providing a western-style academic curriculum. For her efforts as a teacher, she gained praise and admiration from the local community, including American Indian parents and students. However, not all White school officials agreed on Winnemucca’s approach, which led to the school’s ultimate closing. Although the school did not remain open, Gere (2005) notes that Winnemucca’s methods of teaching would remain a modeled approach employed by other Native American teachers. A critical aspect of Winnemucca’s method was her raced-based connection to American Indian students and community. These insights were apparent in a letter she wrote to the parents of the Peabody Institute:

You all know me; many of you are my aunts and cousins. We are one race—your blood is my blood—so I speak for your good. I can speak five tongues—three Indian tongues, English and Spanish. I can read and write, and [I] am a school teacher. Now I say this not to boast, but to simply show you what can be done.

(Gere, 2005, p. 8)

This theme of racial identification was a key ideal taken up by several other Native American teachers after Winnemucca. For example, in 1906 after school officials insisted that Indian culture and arts be infused into the curriculum for off-reservation boarding schools, the first Native American art course was taught by an American Indian woman, Angel De Cora. De Cora taught her course by infusing Native American cultures with western ideals of “economic practicality” (Witmer, 1993). Another Native American teacher (the husband of Angel De Cora) hired at Carlisle during this period was Lone Star Dietz, who also was noted for his innovative culturally relevant teaching strategies.

In addition to racial identification, Native American teachers and some supportive White educators (such as Elizabeth Peabody) argued that an integral aspect to Native American pedagogy was the teacher’s ability to use bi-lingual practices. Native American teachers’ ability to speak both the students’ language and the English language made it easier for students to comprehend various academic disciplines. Gere (2005) notes that in some contexts where English-only policies pervaded, Native American teachers found different ways to provide home language instruction despite such policies.

While there was little support specifically for culturally relevant practices for Native Americans students, as indicated by the closing of the Peabody Institute, a growing number of American Indian teachers worked at off-reservation boarding schools during the early 1900s. In fact, with a growing demand for teachers at American Indian schools, the U.S. federal government created teacher-training programs at the largest off-reservation schools, including Carlisle, Haskell, Genoa, Salem and Chilocco (Gere, 2005). These programs offered courses in pedagogy and classroom practice, and also included lab schools for pre-service teachers. Ben Nelson, a Haskell normal school graduate, commented on the impact that trained American Indian teachers could have on American Indian students:

The Indian students now have as their ideal teachers of their own race. The student-teachers that leave this institution and go back among their people, will not only be of infinite value to their community but will stimulate a desire for higher learning in the hearts and minds of the younger generation.

(cited in Gere, 2005, p. 17)

A Shoshone teacher Essie Horne, commented that it was her childhood experiences with Native American teachers that had left the strongest impression on her life, including her
decision to become a teacher. Here she comments on the pedagogical practice of American Indian teachers, Ella Deloria and Ruth Muskrat Bronson:

Ruth and Ella listened to us. They were interested in what we thought about the subject material and interested in our lives. They taught us that we could accomplish anything that we set our minds to.

This theme of racial identification and cultural competence resonated in the stories of many Native American students and teachers during the early twentieth century. These narratives also illustrated Native American students’ and teachers’ persistent efforts to challenge the hegemonic efforts of cultural annihilation within Native American boarding schools.

Closing thoughts on history: early history of Native American teachers

Historians have documented the pedagogies and social practices of Native American teachers such as Alice Callahan, Angel DeCora, Ella Deloria, Lone Star Dietz, and countless other teachers, highlighting the importance race and culture played in their work with Native American students (Coleman, 1993; Gere, 2005; Witmer, 1993). In 1928, with the publication of The Problem of Indian Administration—also known as the Merriam Report—a team of experts funded by the Brookings Institute, alluded to the importance of race and culture to Native American education, suggesting that school officials infuse cultural practices into the pedagogical practice and curriculum of Native American boarding schools. They also included recommendations to provide post-secondary opportunities for the training of more Native American teachers. As stated in the Merriam Report (Institute of Government Research in Administration, 1928):

Plans for higher educational opportunities for Indian young men and women should include scholarship and loan aids for students who show promise of being especially helpful among their own people. Indian teachers and nurses, for example, are likely to have a special field of service for some time to come.

(p. 62)

While the report recommendations clearly revealed the necessity of providing more culturally-informed curriculum and pedagogy, it should be noted that prior to 1928, there were several documented accounts of Native American teachers already implementing strategies suggested by the Merriam Report. The narratives of Native American teachers during the early 1900s provide an essential historical context to the enduring importance of teaching as a cultural and political practice. In recent years, the literature on education and Native American students has continued to emphasize the importance of language and cultural competence.

SITUATING HISTORICAL DISCUSSIONS WITHIN THE PRESENT

The right to a quality education for any child regardless of race/ethnicity or language has been debated and re-defined numerous times in this nation’s history. The conversation invariably comes too late and is typically prompted by pressures of civil unrest, or
recognition of economic and demographic realities. In the past as well as in the present, questions of who is best prepared to educate youngsters who are poor, non-White and often underserved are incessantly debated once there is a general consensus as to whether and to what extent they should be educated at all.

Once the established educational rights and privileges of the majority are extended to students of all racial, ethnic and linguistic backgrounds, valuable history is frequently lost. There is little acknowledgement of what communities of color had accomplished in providing quality instruction to their children, and the methods that they used to meet their respective goals. For instance, the Emancipation Proclamation abolished slavery and also gave license for pre-existing underground African American educational institutions in the South to legally exist and to be recognized. Although Historically Black Colleges and Universities (HBCUs) continued to yield a far greater proportion of degreed and qualified African American professionals, there is little to suggest that newly integrated majority institutions sought their counsel in working with African American students. Similarly, Brown v. Topeka Board of Education in 1956 and Lau v. Nichols in 1974 brought to the forefront discrepancies in educational access, resources, and quality in public schools. Yet for decades, these discrepancies were addressed through private and community supported schools. In the post-Brown era, approximately 31,584 African American teachers lost their jobs in 17 southern and border states (Ethridge, 1979), and were not welcome in newly integrated schools. More than a quarter of a century after Lau, those who have the pedagogical training and fluency in languages other than English are precluded in many states from teaching students in ways that they understand will enhance student achievement. Thus, the wealth of skills, knowledge and abilities that educators of color possess are frequently diluted or ignored in policies that are crafted to “enhance” equal educational opportunity.

For one and for all: perceptions and reality

For the nineteenth and most of the twentieth century, the societal role for people of color was distinct from that perceived for the dominant majority. There was the perception that African Americans, Latinos, Asian and Native Americans would serve a supportive role to the majority population’s goals and that their education should be framed within this context. They were to reside in segregated communities and adhere to the cultural norms of the majority. This would be their American Dream. It was difficult for many individuals of color to see beyond these expectations as they struggled day to day to provide for their own and survive. Still, there were some from these communities who saw beyond the socio-economic and political limitations of the time and led the masses through more ambitious and liberating agendas (Moore, 1999).

Still, Tippiconnic (2000) contends that very little has changed for Native American Indian education since the seminal Merriam report was issued in 1928. Similarly, scores of researchers and scholars reported similar sentiments during the 2004 fiftieth anniversary of the Brown v. Board of Education decision. Yet, as Huntley (2004) notes, “… there is a sense of bridled optimism about the future in part because of what Brown, against the odds, was able to set in motion” (p. 3). Fairclough (2004) reminds us that all changes in teaching and the composition of the teaching force—good or bad—need not be attributed to the Brown decision and had little connection to integration. He argues that all was not good in segregated society, that “the post integration literature on segregated schools, often celebratory and sometimes hagiographic, must be treated with caution” (p. 45). He notes also that features attributed to African American teachers’ effectiveness in segregated schools, e.g. corporal punishment, were abandoned in all
schools for a reason, and that many African American teachers who lost their positions to integration were ill-educated and poorly trained.

The tumultuous 1960s and 1970s brought racial/ethnic identity to bear on education and teaching. In similar, but louder, voices than in the past, African, Latino, Asian, and Native Americans redefined their missions and goals to focus explicitly on the needs and desires of their communities and youth. Public and private schools and educational programs that were situated in communities of color were established and controlled by the parents and students who attended them. These community or alternative schools were condoned by public agencies as experiments. Still, the efficacy of these schools’ teaching practices and curriculum were often called into question and dismissed by some as pacifiers to civil unrest.

In some ways, the sentiments and approaches to these community schools were consistent with those of previous decades. In the classic book, *An American Dilemma*, Gunnar Myrdal (1944) illustrates this point:

> Concerning the content of teaching in other respects, Negroes are also divided. On the one hand, they are inclined to feel that the Northern system, where standardized teaching is given students independent of whether they are Whites or Negroes, is the only right thing. On the other hand they feel that the students get to know too little about Negro problems. They thus want an adjustment of teaching toward the status of Negroes, usually not in order to make the Negroes weak and otherwise fit into the White man’s wishful picture about “good niggers” but, on the contrary to make Negroes better prepared to fight for their rights. They feel that education should not be accepted passively but should be used as a tool of concerned action to gain the equal status they are seeking. For this reason, all if not most, Negro leaders desire that Negro students should get special training in the Negro problems.

(p. 901)

The efforts of community-controlled education were in part an effort to avoid what Anderson (1988) notes:

> When you look at the curricula that was developed—domestic science for women, industrial education for African Americans, boarding schools for Native Americans—much of what developed under the guise of a demographic and differentiated curriculum was in fact a way to reinforce the kind of class, gender, and race prejudice that existed in society.

(p. 112)

Given the new focus on cultural identity, it is not surprising that the 1960s also prompted the establishment of a number of race/ethnic specific organizations for teachers. Lomawaima (1995) offers that the Native American takeover of Alcatras Penitentiary had much to do with the type and quality of education provided by their community. During this period, the Native American Education Association, Aspira—the organization devoted solely to the education and leadership of Puerto Rican and other Latino youth, and the National Alliance for Black School Educators, were established. Unlike the segregated local, state and national organizations of earlier decades, these organizations were able to openly engage teachers from these groups, formally establish relationships with each other, and engage majority organizations and colleagues on issues of policy and practice relating to education and society.

It is interesting to note that following this period of engagement in the 1960s and
1970s, there began a precipitous decline in the number of teachers of color. Given access to careers that were previously prohibited, women generally and women of color specifically began to pursue careers in other fields, leaving a significant void in the teaching ranks (Darling-Hammond, Dilworth, & Bullmaster, 1996; Dilworth, 1984; Garibaldi, 1986). Thus as the nation’s student population became increasingly diverse, those most prepared and knowledgeable about culturally responsive practice were absent. What we eventually found in the 1980s and 1990s were seasoned teachers of color retiring. They left the profession, taking with them the heritage and knowledge of previous decades and the spirit of racial uplift; they were lost to the nation’s educational system at the time of greatest need.

Snyder notes that after World War II, 79 percent of African American female graduates were employed as teachers, but by the mid-1980s, this number had fallen to 23 percent (1998, cited in Zumwalt & Craig, 2005). Throughout the late 1980s and early 1990s, significant support—primarily by private philanthropic organizations and agencies—encouraged participation of teachers of color by establishing targeted recruitment programs in schools, colleges, and departments of education (SCDEs), as well as community colleges and high schools (Darling-Hammond et al., 1996). Recent data indicate that

The numbers of prospective and practicing teachers of color vary widely by region and by institution. They are more likely than Whites to start their higher education at 2-year colleges and transfer to 4-year public institutions for teacher preparation . . . Minority teachers disproportionately teach at the elementary level and are found more often in central cities and schools serving high proportions of minority and low-income students.

(Zumwalt & Craig, 2005, p. 140)

While we speculate that all licensed teachers have the ability to educate students to their full academic potential, teachers of color offer a value-added dimension of racial/ethnic or linguistic relationship. At the same time, it is important to acknowledge that similar teacher-student race, ethnicity and language do not ensure enhanced teaching and learning (Banks et al., 2005). However, while there are similarities among all effective teachers, there are also differences. The cultural backgrounds of educators help illuminate these differences:

Given their culturally diverse backgrounds, and academic training defined by the White majority, Black, Hispanic and other minority teachers possess a consummate understanding of the relationship between education and this society. This knowledge enhances the quality of education when these teachers offer their students broader and more complex interpretations of the educational curriculum, and when they translate and interpret for their majority peers, in educational terms, the cultural backgrounds of their students.

(Dilworth, 1990, p. xi)

Same goals, varying perspectives

Rong and Preissle (1997) in their discussion of Asian American teachers posit that while the literature on teachers of color typically combines and treats all such groups generically, there are apparent differences that evolve from ancestry, language, immigration, and access and participation in higher education. Indeed, there are factors that distinguish teachers of differing cultures but there are also commonalities of roles and practice. For
instance, when describing African American teachers with whom she worked, Irvine (1999) provides:

The pedagogy and mastery of the content standards were less important than these teachers’ beliefs about the nature of teaching itself. Teachers, in my research, not only viewed teaching as telling, guiding, and facilitating mastery of the much-heralded content standards, but they also believed teaching is defined as caring, “other mothering” believing, demanding the best, responding to one’s calling and disciplining.

(p. 249)

Similarly, Nieto (1994; 1998) reflects on characteristics of effective Latino teachers who, like Irvine’s “other mother” teachers, tend to practice with the notion of extended family relationships. She cites Montero-Sieburth and Perez’s (1987) identifiers used by a bilingual teacher as “teacher, friend, mother, social worker, translator, counselor, advocate, prosecutor, group therapist, hygienist, and monitor” (p. 158). Nieto notes that the caring characteristic is often attributed to Puerto Rican and other Latino teachers, however these features can be found in teachers of any culture if the intent and understanding exists.

The present day demands made of those who know how to engage, challenge and teach youngsters, are enormous. Significant philanthropic efforts of the late 1980s and sometimes desperate efforts, e.g. alternative teaching licensure routes, to recruit and license more teachers of color, have just begun to bear fruit. At the same time, we acknowledge that for the foreseeable future, the teaching force will remain largely White. Research and knowledge of diverse cultures and ways of knowing are now at a premium in teacher education and professional development. Virtually all state and disciplinary teaching standards and assessments address matters of student diversity, yet this information must be shared in formats that are consistent with the academy or else they will be/are lost. The burden of everyday practice—teaching well—often precludes culturally responsive teachers from contributing to meaningful initial and continuing professional development (Johnson, S. M., 1990; Rios et al., 1998). A number of contemporary scholars provide us with significant examples of the strength of practice that teachers of color provide (Foster, 1994; Henry, 1998; Ladson-Billings, 1994; Pang & Sablan, 1997; Siddle Walker, 2005). Exhibiting the cultural teaching styles of their predecessors, teachers of color are often observed and discussed in the literature. Authors such as Cochran-Smith, Fraser and Perry, Zimpher and Ashburn, and Sleeter aptly relay their understanding of these practices to those teachers who will educate an increasing number of youngsters from non-White cultures, as well as to teacher educators who prepare prospective teachers who, for the foreseeable future, will remain predominantly White.

Reviewing the preparation and practices of teachers over time allows us to understand and substantiate society’s values towards education as well as towards difference. The criteria for acceptance into the profession, time and attention to preparation, the caliber of those who teach teachers, and the contexts and situations that inform the curriculum all contribute to a weak or strong teaching force. Yet as Hollins and Guzman (2005) offer, research on teachers of color focuses primarily on three areas: retention in teacher education programs, alternative experiences, and program experiences. Indeed, until the 1990s, issues regarding the preparation of teachers of color were rarely studied or analyzed as anything other than a problem, i.e. supply and demand. As Sedlak and Schlossman (1987) note, “without intensive, in-depth analyses of the broad trends . . . historians’ and policymakers’ understanding of why and how major changes in the teaching force have come about will inevitably remain superficial” (p. 94).
In recent times, preparation and pedagogy have been examined more closely in search of guidance in educating the increasing number of youngsters from racial, ethnic, and linguistically diverse cultures. In fact, there is a perception among members of all communities of color that they are frequently reviewed and scrutinized by others. For instance, it is interesting to note that McWilliams (1943), as well as Deyhle and Swisher (1997), contend that African American and American Indians respectively are the most studied ethnic groups in the literature. Nieto (1998) and Rong and Preissle (1997) also note a proliferation of education studies in recent decades focusing on Puerto Ricans and Asian Americans respectively. Given the disparities in the academic achievement of some of these groups, these perceptions suggest that the findings may not resonate or find an audience with those responsible for teaching students from these groups. It is apparent that culturally responsive themes are an important component in the education research literature. To ignore or avoid their importance is counter-productive to efforts to close the achievement gap.

Conclusions

In the case of teachers of color, we find the determination of their respective communities and commitment of philanthropic and religious organizations forging quality preparation and effective practice despite lack of support from the general population. Disenfranchised racial, ethnic, and linguistically diverse groups for the past centuries have endured for three primary reasons: the uplift of the race, maintenance of culture and the pursuit of social–economic justice. In reviewing the literature, we note how educational events and policies impact or situate teachers of color in schools and practice. We note occasions where “minority” teachers and communities craft schools and other educational experiences that supplement standard—and sub-standard—educational offerings. From the nineteenth century until today, these groups have established for themselves, in segregated settings, syllabi, and program designs that best suit their goals. There is a similar message in all of these efforts, that while there is something of value, usefulness, and necessity in the educational offerings of standard basic education, rich educational experiences can be created by engaging teachers and communities of color in a greater way than they are, typically, or at this time. This century’s teachers are more formally prepared, degree and licensed than at any point in the history of this nation. While the teaching force is by and large White, there is a cadre of African, Latino, Asian and Native American teachers, who by virtue of their heritage and culture, offer a value-added dimension to effective teaching and learning. Given the challenges of today where the educational environment for the poor and students of color is fraught with inequities (Kozol, 1991), and far too many students of color find schools and teachers unwelcoming (Macedo & Bartolomé, 1999), it is apparent that we have not fully recognized and empowered of teachers of color in a manner that will help reconcile the issues that we face.

NOTES

1 A “Tejano” is a person of Mexican heritage born and living in Texas (San Miguel, 1987).
2 The term “Hispano” refers to people of Hispanic descent living in New Mexico (Getz, 1997).
3 During this period, “progressive” educator John Dewey’s ideas of community education were widely recognized within educational discourses.
4 The early history of Japanese-Americans also provides an important historical perspective about how culture, language and race informed the early educational experiences of Asian American

The next generation of teachers
Who enters, who stays, and why

Susan M. Kardos
Independent Researcher

Before the 1960s, teaching was largely a short-term career chosen by men on their way to another line of work and women who taught until they married or had children (Lortie, 1975). Leaving teaching was not always a matter of choice for women, since many school districts required them to resign once they married or became pregnant. However, as the demand for teachers grew and sanctions on women teachers relaxed in the 1950s, the teaching force stabilized. In the late 1960s and early 1970s, public schools hired the first cohort of teachers who would make teaching a lifelong career (Grant & Murray, 1999; Rury, 1989; Spencer, 2001; Teacher Quality Clearinghouse).

By 2000, however, analysts began to predict that the teaching force would again be transformed. Hussar (1999) projected the need to hire 2.2 million new teachers by 2010. In 2001, more than one-third of all teachers had more than 20 years of experience (National Education Association, 2003) and could be expected to retire soon. Forecasts of continued change were further substantiated in 2005 by results from a survey of U.S. public school teachers, 40 percent of whom said that they would not be teaching in 2010 (Feistritzer, 2005). At the high school level, that percentage was even higher (50 percent). Given that 27 percent of the respondents had been teaching 25 years or more, approaching retirement explained much of the projected turnover. However, there was more to the story than the predictable retirement of an aging teaching force.

Since they were hired in the late 1960s and early 1970s, the generation of teachers approaching retirement has continuously constituted the largest cohort of the teaching force (Wirt, 2000). Because of their high retention rates and the decline of student enrollments during the 1980s, far fewer teachers were hired in the 1980s and 1990s. Since 2001, however, when substantial numbers of veteran teachers began to retire, school districts have aggressively recruited and hired the next generation of teachers. The profile of experience in the teaching force has become increasingly U-shaped with two distinct cohorts, one entering and one leaving with relatively few teachers in between (Johnson & The Project on the Next Generation of Teachers, 2004; National Education Association, 2003). Differences in the priorities and expectations of these two groups have led researchers to call the valley between these two peaks a “generation gap” (Johnson & The Project on the Next Generation of Teachers, 2004).

In the 40 years since the last major wave of hiring, the work of teaching has changed dramatically. Schools today serve much larger and more diverse student populations than ever before due to increased immigration, higher birth rates, and policies adopted to improve education for a wider range of students, especially those from low-income communities, those with disabilities, and English language learners. Overall, state and federal policy has increasingly required teachers not only to serve all students, but to
succeed with them as well. Under the No Child Left Behind Act, low-performing schools face unprecedented sanctions if they fail to make steady gains.

With these new demands on public education has come increased concern about the quality of teachers, since research clearly demonstrates that teachers are the most important factor in students’ learning (Haycock, 1998; McCaffrey et al., 2003; Sanders & Rivers, 1996). However, with the impending retirement of such a large segment of the teaching force, it is not clear if public education can attract and retain a new cohort of teachers sufficiently skilled and committed to meet the growing demands on schools. Many potential teachers never consider a career in the classroom (Public Agenda, 2000) and attrition rates among those who enter teaching are surprisingly high (Ingersoll, 2001a). In this chapter, we consider what is known about the next generation of teachers, how current patterns of attrition undermine the stability of the teaching force, what factors affect new teachers’ career decisions, and what reforms are underway to support and retain them.

A DIFFERENT LABOR CONTEXT

When teachers of the retiring generation were hired 35 to 40 years ago, the labor market for teaching was much different than it is today. Other professions were closed, either tacitly or explicitly, to the women and people of color who comprised education’s traditional labor pool. This group of well-educated recruits to the classroom provided their talents and knowledge at a discount since they would have earned more had they been hired to work in other fields; thus they have become known as the “hidden subsidy” of public education. At the same time, politicians lauded public service as respectable work, and teachers retained a certain status, even though their comparatively low pay signaled otherwise. Moreover, long-term careers were the norm in society four decades ago. Whether individuals entered banking, accounting, or nursing, they typically chose a career for life, often working for a single organization. Thus, the cohort of teachers now retiring often chose teaching by default, never seriously weighing the benefits and limitations of other lines of work. Large numbers of them made a lifetime commitment to the classroom.

Those considering teaching today do so within a very different labor context. All career options, from engineering and medicine to business and finance, are open to them. In fact, today many professions actively recruit the very candidates they excluded before 1970. Teaching thus has become one of the many possible career choices for women and people of color, who once could be counted on to enter teaching in large numbers.

The newer career opportunities competing directly with classroom teaching today have certain advantages. For example, law offices, architecture firms, and advertising agencies typically provide more comfortable and attractive work environments than schools and usually offer greater support for their employees’ work. Recruits can expect to earn much more on entry than they would in teaching, and they can anticipate far higher wages over time than the standard salary scale teaching promises (Allegretto et al., 2004). In addition, the prospect of high pay in other lines of work also brings a level of status that classroom teaching lacks. Other fields also offer a job candidate the possibility of expanded responsibility and recognition within a relatively short time.

Further complicating the challenge of staffing schools for the long term is a shift in people’s expectations about the nature of career. Long-term careers, once the norm across the society, are far less common today. According to a recent study, the average American 32 year old already has worked for nine firms (Editors, 2000). Thus, there can
be no certainty that an entrant to teaching will remain in the classroom for 35 years until retirement. Given the attractions of competing work environments—more comfortable and supportive workplaces, higher pay and status, greater opportunities for advancement—and decreased commitment to any long-term career, it is unlikely that the public schools can replace the teachers of the retiring generation with a similarly skilled and steadfast cohort.

THE NEW GENERATION OF TEACHERS

Given this context, what is known about the current entrants to teaching? First, the group of teachers being hired today is far more diverse in age and experience than ever before. Whereas most of the retiring generation entered teaching soon after college, far more of today’s entrants are choosing teaching at mid-career. Random sample surveys of first-year and second-year teachers conducted between 1999 and 2003 in seven states (California, Florida, Massachusetts, Michigan, North Carolina, New Jersey, and Washington) revealed that a large proportion of new teachers are entering at mid-career, at ages 35 to 38 (Kardos, 2004; Kauffman, 2005; Liu, 2004). In these surveys, mid-career entrants to teaching comprised between 28 percent of new teachers in Michigan and 47 percent in California. These mid-career entrants bring to teaching a different set of skills, experiences, and expectations (Johnson et al., 2005; Johnson & The Project on the Next Generation of Teachers, 2004). Unlike the first-career entrants who moved directly from being students to teaching students, mid-career entrants have been away from school for a substantial period of time, working in other types of settings that offer greater support and earning potential than schools. Often these mid-career entrants had supervisory responsibilities and worked on teams with other employees. They have chosen to teach at mid-career largely because they were dissatisfied with the values or demands of their prior workplaces; for them, teaching offers the promise of more meaningful work (Feistritzer, 2005; Johnson et al., 2005). Many bring to teaching knowledge, skill, and experiences they gained in real-world enterprises as chemists, engineers, or journalists. Often they are parents who enter the classroom more confident than their first-career counterparts about their role as an authority figure. Many, though certainly not all, express a commitment to remain in teaching long-term (Johnson et al., 2005).

The first-career entrants, by contrast, are both younger and less experienced in other types of work and organizations. Although many have always planned to be teachers and anticipate a long career in the classroom, more of them approach teaching tentatively (Peske et al., 2001). They talk of exploring teaching. If they find success there, they may stay; if not, they will move on (Johnson & Birkeland, 2003). Others plan to make a short-term contribution to teaching by committing a few years to public education before entering another line of work (Peske et al., 2001). First-career entrants are well aware that teaching is publicly held in low regard, that they could earn more in another field, and that the day-to-day work of teaching is very demanding. They are not certain that they will be satisfied with the conditions of work or succeed with today’s students.

The cohort of new teachers today also enters schools with differing levels of preparation. Some have majored in the subject they will teach and have completed undergraduate or graduate programs in education, including a substantial period of student teaching under the supervision of experienced, expert teachers. Others enter teaching through alternative routes. Nearly all states today authorize and often fund alternative certification programs through which prospective teachers can attain a provisional license after five to eight weeks of coursework and part-time student teaching in a summer school
(Feistritzer & Chester, 2003). These fast-track programs often are designed to prepare mid-career entrants for a quick transition into the classroom. In addition to these entrants who are traditionally or alternatively prepared, there are many new teachers with no formal preparation. Although the regulations of No Child Left Behind make it increasingly difficult for school districts to employ teachers on an emergency license, many still do since fully licensed teachers are not always available. Thus, there is a tremendous range of preparation among new teachers entering schools today.

As a group these new teachers vary widely in their expectations, experience, and training. However, their schools are remarkably similar—flat organizations, with the majority of teachers working independently and reporting directly to one or two administrators. Compared with the more complex and varied workplaces that many mid-career entrants have known, schools are far less flexible in structure, seldom reorganizing in response to new demands or evidence that they are ineffective. Most new teachers continue to work in “egg-crate” schools, where they are assigned to separate classrooms and given sole responsibility for a group of students throughout the school year. They can anticipate doing the same work in the same way on the first and last day of their career. Pay is predictable since all teachers within a district are paid according to a single salary scale, compensating them modestly for earning advanced degrees and continuing to teach from year to year. Unless they take on an extra assignment as an athletic coach or student club sponsor, teachers in most districts can never expect to earn more than another colleague with similar degrees and years of experience.

Increasingly, evidence shows that such “egg-crate” schools are no longer effective, if they ever were. Schools found to support the improvement of instruction for all students tend to be far more flexible, responsive, and team-based (Rosenholtz, 1989). They distribute leadership, making good use of teachers who offer greater expertise or specialized knowledge and skills (Elmore, 2004a). They have a coherent curriculum and demonstrate consistent instructional practices school-wide (Abelmann & Elmore, 1999; Elmore, 2004b). They promote positive norms for students’ behavior and teachers’ professional practice, while building trust among all parties (Bryk & Schneider, 2002). They have deliberate strategies for socializing and supporting new teachers; novices are not left to sink or swim (Berry et al., 2002). These are the kinds of schools needed today, given the extensive turnover in the teaching force and the wide range of needs and experience among new entrants. Although the retiring generation of teachers largely found that the schools they entered fit their expectations, early research on the current cohort of new teachers entering the classroom suggests that many are dissatisfied with their schools and know that they have other workplace options (Boston Plan for Excellence, 2005).

TEACHER TURNOVER

For almost four decades, teacher turnover was a minor concern for school administrators and policymakers. However, since 2000, it has become increasingly apparent that schools are no longer retaining teachers as they once did, and thus teacher retention has replaced teacher recruitment as the first priority of many states and districts (National Commission for Teaching and America’s Future, 2003), since high rates of teacher turnover introduce unprecedented costs—financial, instructional, and organizational.

Researchers use the term “attrition” to denote the loss of teachers from the profession and “migration” to denote teachers’ movement from one district or school to another. “Turnover” is an umbrella term used for both (Ingersoll, 2001b). The policy implications
for attrition and migration differ. For example, a state official with a goal of maintaining the size of the teaching force statewide, will be far more concerned about rising attrition rates than high rates of migration. A local school official is more likely to focus on the causes of teacher migration from district to district, while a school principal will attend to movement from school to school. For those working in schools, the consequences of migration and attrition are much the same. Whether a teacher leaves the profession entirely or moves to the school across town, the loss disrupts continuity and introduces new demands. Ongoing turnover is costly and disabling to schools, districts, and states.

Currently, turnover rates among teachers are relatively high and thought by many to be growing. In 2000–2001, the most recent year for which there are national data on teacher turnover, 7.4 percent of public school teachers left the teaching profession and 7.7 percent moved to a different school for a total turnover rate of 15.1 percent, which exceeds by 2 to 3 percent that of the prior decade. Attrition rates among white, non-Hispanic teachers (7.5 percent), Hispanic teachers (7.5 percent) and black, non-Hispanic teachers (7.4 percent) were much the same. However, migration rates varied somewhat more among these three groups; 7.6 percent of white, non-Hispanic teachers changed schools, while 8.3 percent of black, non-Hispanic teachers and 7.1 percent of Hispanic teachers did so. Teachers who self-identified as Native American or Alaskan Native had generally the same attrition rates as these other groups (7.5 percent), but substantially lower migration rates (4.7 percent). Asian and Pacific Islander teachers left the classroom at far lower rates (2.1 percent) and moved at far higher rates (16.2 percent) than the other groups (Luekens et al., 2004).

Ingersoll (2001b) found that retiring teachers comprised only 12.3 percent of those who left teaching in 1991, but by 2001 they represented 27 percent of the leavers. As Feistritzer’s data suggest, the proportion of turnover that can be attributed to retirement is likely to increase through at least 2010 (Feistritzer, 2005). However, there is evidence that new teachers today are leaving the classroom after a short time in their career. Recent analysis (Luekens et al., 2004) reveals that teachers under 30 were the least likely of four age cohorts to remain in their schools from 1999 to 2000. The Boston Public Schools reports losing half of their new teachers in three years (Boston Plan for Excellence, 2005). If other districts experience comparable attrition, the cohort of new teachers may leave schools at rates that rival those of their retiring colleagues.

Notably, turnover is not equally distributed across subjects or schools. Researchers have found higher turnover rates for teachers of mathematics, science and special education than for teachers of other subjects, although studies using different data sets do not report consistent findings (Ingersoll, 2001b; Kirby et al., 1999; Murnane et al., 1991). There is little current research documenting turnover rates in separate subjects, although anecdotal reports from districts suggest that staffing these fields continues to be very difficult.

Schools that experience high rates of turnover typically serve low-income communities. Ingersoll (2001b) reports that among public schools in 1990–1991, those serving high-poverty communities experienced higher turnover rates (15.2 percent) on average than did low-poverty schools (10.5 percent). Similarly, schools enrolling higher proportions of minority students experienced higher rates of turnover. Luekens et al. (2004) report that 16.8 percent of teachers left schools enrolling more than 35 percent minority students; 14.7 percent of teachers left schools enrolling between 10 and 35 percent minority students; and 13.5 percent of teachers left schools with a minority enrollment of less than 10 percent. Hanushek et al. (2004), who report a similar pattern in Texas schools, also found that schools where students scored within the bottom
quartile on state tests had annual attrition rates of 20 percent, while those achieving average scores experienced rates of 15 percent. Combined, these studies suggest that “students at lower-performing, lower-income, higher-minority schools are more likely to have inconsistent staffing from year to year and to be taught by a greater number of inexperienced teachers than their counterparts are at higher-achieving, more affluent, and predominantly white schools” (Johnson et al., 2005, p. 6). It is not clear from this line of research, however, whether teachers choose to leave because of their low-income, low-performing, minority students or because the schools attended by such students fail to support effective teaching and learning.

WHY RETENTION MATTERS

Many who express concern about the quality of teachers today criticize efforts to retain them at high rates. Clearly, schools will not improve if ineffective teachers are encouraged to stay, and many analysts make the point that 100 percent retention is an unwise objective (Ballou & Podgursky, 1997; Guarino et al., 2004; Hanushek et al., 2004). However, there is evidence based on teachers’ test scores that schools experiencing turnover tend to lose their more able rather than their less able teachers (Lankford et al., 2002; Murnane & Olsen, 1989; Podgursky et al., 2004; Stinebrickner, 2001). If the quality of the teaching force is to improve, especially in low-income, low-performing schools, policy and practice must provide support and reinforcement for promising teachers, while ensuring that those who fail are dismissed in a timely way.

Financial costs

Researchers have begun to document the substantial financial costs of turnover, although their approaches and results vary. Most calculations include the personnel costs of recruitment, hiring, induction, professional development, substitutes’ pay, and separation expenses, such as unemployment pay. Some also include the lost investment in teacher preparation. Again, it makes a difference whether one assesses the costs from the perspective of the state, district, or school. Districts that invest most in their new teachers have the most to lose when they leave and, thus, their per-teacher turnover costs tend to be highest. The Texas Center for Educational Research (2000) found that per-teacher turnover costs ranged from $354.92 in a district with relatively low turnover and recruiting problems, to $5165.76 in a district with high turnover. A 2003 study of 64 elementary schools by the Chicago Association of Community Organizations for Reform Now (ACORN) (2003) used three models for calculating the costs of turnover. The first, based on schools’ reported costs, averaged 20 percent of the leaving teacher’s salary ($10,329). The second, using an industry model, estimated the costs at 150 percent of the leaving teacher’s salary ($77,470.50). The third estimated the costs at 2.5 times the average per-teacher expense of teacher preparation statewide ($63,689.00). Birkeland and Curtis (2006) examined the costs to the Boston Public Schools of recruiting, hiring, providing professional development, and processing the job terminations of new teachers who leave. They found that replacement costs were $10,547 for a first-year teacher, $18,617 for a second-year teacher, and $26,687 for a third-year teacher, annual increases that are largely due to the district’s investment in professional development. A recent analysis by the Alliance for Excellent Education reports a “conservative” estimate of turnover costs nationally at $2.2 billion per year; when the costs of migration are added, the total reaches $4.9 billion (2005).
Instructional and organizational costs

Beyond these financial expenses, turnover carries instructional and organizational costs. New teachers have been shown to improve over the first few years of teaching (Ballou & Podgursky, 1998; Hanushek et al., 2004; Murnane & Phillips, 1981; Rockoff, 2003). Therefore, when schools lose them, they also lose the investment made in their new teachers’ induction. Because schools tend to fill the resulting vacancies with more novices, they are unlikely to improve the quality of instruction over time. When teachers “repeatedly leave a school before they become competent in their practice, students will be taught by a string of teachers who are, on average, less effective than more experienced teachers” (Johnson et al., 2005, p. 7). Moreover, as noted above, because teachers with the highest qualifications leave teaching in greater proportions than those with lower qualifications, the instructional costs are compounded.

Research on turnover conducted in Philadelphia from 1999–2000 to 2002–2003 (Neild et al., 2003) revealed that the schools serving the highest poverty communities had the most difficulty retaining teachers and filling vacancies. These authors identified the far-reaching organizational costs of such turnover, noting that it “impede[d] development of a coherent educational program, institutional memory, and staff cohesion” (p. 14). Therefore, students lose when a teacher who knows the curriculum or the community leaves and is replaced by a novice who must start afresh. At the same time, teachers and administrators lose a colleague with whom they may have had productive professional relationships or looked to for schoolwide leadership. They must then invest scarce time and resources to find a replacement and rebuild shared practices.

WHY DO TEACHERS LEAVE? WHY DO TEACHERS STAY?

Over time, teachers offer the same explanations for why they leave teaching. One is low pay. Another is unsatisfactory working conditions. However, these are not independent factors in teachers’ career decisions, for often teachers report that poor working conditions exacerbate their dissatisfaction with pay. Combined, low pay and substandard working conditions underscore the lack of status that teaching has in society today. When teachers leave, they seldom attribute their departure to a single factor, instead citing some combination of inadequate pay, unacceptable working conditions, and low status. The following discussion reviews what is known about the role of pay and various aspects of working conditions in teachers’ career decisions.

Pay

Prospective and current teachers often cite pay as one factor dissuading them from entering or remaining in teaching. Although there is dispute among policy analysts about whether pay in teaching is low relative to that of comparable fields, there is evidence that pay is a factor in non-entry, dissatisfaction, migration, and attrition. Also, there is some evidence that teachers are attracted by districts offering higher pay.

Are teachers underpaid?

Most researchers have found that teachers are paid less than employees with comparable education, and that the gap between the two groups is growing. For example, an analysis conducted for Education Week/Quality Counts (Olson, 2000) shows that in 1994,
teachers with a bachelor’s degree made $11,035 less (in 1998 dollars) than non-teachers with a bachelor’s degree. By 1998, the gap was $18,000. The pay discrepancy between teachers and non-teachers holding a master’s degree is even more dramatic, having doubled between 1994 ($12,918) and 1998 ($24,684). Similarly, Henke et al. (2000) examined the pay of bachelor’s recipients after five years of full-time work and found that teachers’ salaries were lower than those of any other professionals. Loeb and Reininger’s (2004) review of research studies based on national data led them to conclude that “teachers’ salaries are close to those of social workers, ministers, and clerical staff. Lawyers, doctors, scientists, and engineers earn substantially more, as do managers and sales and financial workers” (p. 40). Allegretto et al. (2004) reached similar conclusions when they compared the weekly salaries of employees whose work required similar levels of skill and had similar market value. By their calculations, teachers earn an average of 12 percent less per week than the composite salary of the other groups.

Those who report significantly different findings often are counting only the hours for which teachers are contractually required to be on duty in schools. Using such an approach, Vedder (2003) concluded that teachers’ pay is much higher than that of other workers with comparable education, such as architects, mechanical and civil engineers, and nurses. Unlike Vedder, most researchers take into account teachers’ additional preparation time and conclude that teachers are underpaid.

How does pay affect decisions about teaching?

There is some evidence that many prospective teachers never enter the profession because of low pay (Public Agenda, 2000) and a widespread belief that the problems of teacher quality and teacher shortages could be best addressed by substantially increasing pay for all teachers (Moulthrop et al., 2005). However, far more is known about how pay affects current teachers’ decisions.

Economists have studied the effects of different pay levels on teachers’ decisions to accept a district’s initial job offer or to transfer from one district to another. An analysis of national data about the graduating high school class of 1972 led Ballou and Podgursky to conclude that a raise for all teachers within a district would enable the district to attract teachers with higher test scores (1995). Similarly, Figlio (2002) concluded that districts with higher pay could attract teachers holding degrees from more selective colleges. Lankford et al. (2002) analyzed New York teachers’ employment records and found that their income increased by 4 to 15 percent when they transferred to a new district, suggesting that they were drawn by the prospect of higher pay.

Just as higher pay has been found to attract teachers, it has been shown to retain them, especially early in their career. Dolton and von der Klaauw (1995) studied first-career entrants to teaching in the UK and concluded that a 10 percent salary increase was associated with a 9 percent reduction in the probability that they would have left teaching after five years. Similarly, Murnane et al. (1991) concluded that North Carolina and Michigan teachers who worked in districts with comparatively higher salaries stayed in teaching longer than those employed by districts with lower salaries. Stinebrickner (2001) examined the career decisions of a national sample of teachers during their first nine years and also found that higher salaries are associated with longer retention.

Much of this research is conducted using the average pay figure for teachers within a district. However, some districts deliberately “front-load” their pay scale to attract new teachers, while others reward long-serving teachers at the top of the scale. Little is known about how different approaches to distributing pay on the salary scale affect teachers’ decisions to enter or remain in teaching.
Often researchers analyze the effects of pay without attending to the role that working conditions play as teachers decide whether to transfer or to leave teaching. Teachers interviewed in two studies (Johnson, 1990; Johnson & The Project on the Next Generation of Teachers, 2004) reported that they expected to earn enough in teaching to live a comfortable, middle-class lifestyle. Younger teachers told of stress when they could not pay their bills or finance vacations, while those with more experience complained about not being able to afford a house or to send their children to college. However, along with expressing dissatisfaction with their paycheck, many complained about the difficulties they encountered day to day on the job. Often pay took on greater importance in the face of unsatisfactory working conditions.

**Working conditions**

The teacher’s workplace is composed of many elements that can make teaching productive and satisfying or unsuccessful and dispiriting work, particularly for new teachers. Important factors include teachers’ assignments; their working relationships with colleagues; access to curriculum and resources; the organization and leadership of the school; the abilities, attitudes, and behavior of students; and the quality of facilities in which they teach. These factors take on different levels of importance for different individuals working in different settings.

**Appropriate and fair teaching assignments**

Having a teaching assignment that is manageable and within a new teacher’s field is critical to satisfaction. Qualitative research shows that new teachers decide to leave teaching or transfer to another school in response to excessively large classes or teaching loads; assignments that are split across grades, subjects or schools; or assignments outside one’s field (Johnson & The Project on the Next Generation of Teachers, 2004). Often new teachers are assigned the courses or classes that are left, once more experienced teachers are given their preference. The importance of having an appropriate and fair teaching assignment is apparent when one considers the great difficulty that most new teachers face as they first enter the classroom. Analyzing national survey data on teacher attrition and mobility, Luekens et al. (2004) found that 40 percent of teachers who move to another school seek an opportunity of a better teaching assignment. Of those in the sample who left teaching, 13.1 percent said that dissatisfaction with their job responsibilities was a “very important” or “extremely important” factor in their decisions.

Out-of-field assignments are common in public education. According to research by the National Education Association (2003), 19 percent of teachers spent time teaching outside their field of license. Ingersoll found that large proportions of secondary school teachers lack a major or minor in the subject they teach or in a related discipline: one-third of mathematics teachers, one-fourth of all English teachers, one-fifth of science teachers, and one-fifth of social science teachers (2002). Similarly, he found that 12 percent of those teaching self-contained elementary school classes do not have a degree in pre-elementary, early childhood, or elementary education. Often critics of out-of-field assignments focus on the effects on students of being taught by an underprepared teacher. However, out-of-field assignments surely affect the confidence and satisfaction of the teachers as well, further compounding the consequences for students.

Luekens et al. (2004) report that 24.2 percent of teachers who left the profession in 2000–2001 and 20.3 percent of those who changed schools agreed with the statement, “I
often felt that my teaching workload was too heavy” (p. 21). Large class size was reported to be “continually raised as a source of dissatisfaction” by teachers who were surveyed by the Public Education Network (2004, p. 19). Given evidence that new teachers’ career decisions will depend on whether they experience a “sense of success” with their students (Johnson & Birkeland, 2003), ensuring that their teaching assignments are reasonable may greatly increase the chance of retaining them.

**Working relationships with colleagues**

Although many teachers in the retiring generation preferred to work independently (Lortie, 1975), new teachers today report an increased interest in collegial work (Kardos, 2004; Kardos & Johnson, 2007). The National Education Association (2003) randomly samples teachers’ views every five years. When the survey was first administered in 1956, respondents chose having “cooperative/competent teachers colleagues/mentors” as one of the top six factors that “helped [them] teach well.” Since 1996, teachers have ranked this factor as more important than all others.

Studies about school reform conducted by Rosenholtz (1989), Louis et al. (1996), Bryk et al. (1999), McLaughlin and Talbert (2001), Little (1982), and Bryk and Schenider (2003) all document the importance of collegial work to strengthening instruction and advancing school improvement. However, large proportions of newly hired teachers report that they continue to be isolated in their classrooms. Qualitative research on new teachers has found that they are more likely to stay in teaching and at their schools if they perceive those schools to be places that promote frequent and reciprocal interaction among faculty members across experience levels, recognize new teachers’ needs as beginners, and develop shared responsibility among teachers for the school and its students (Johnson & The Project on the Next Generation of Teachers, 2004; Kardos et al., 2001). Indeed, national survey research has found that the largest reductions in teacher turnover are “associated with activities that tied new teachers into a collaborative network of their more experienced peers” (Smith & Ingersoll, 2005, p. 704). Despite new teachers’ need for collegial exchange, random sample survey analysis (Kardos, 2004; Kardos & Johnson, 2007) has shown that new teachers report that their work is solitary and that they mostly plan and teach alone. Furthermore, they are expected to be expert and independent from the start. For example, about half (49 percent) of new teachers in the 4 states included in the study report that they usually plan and teach alone, and only 44 percent report that extra assistance is available to them (Kardos, 2004; Kardos & Johnson, 2007).

**Curriculum resources and accountability**

Curriculum is central to teachers’ day-to-day work with their students (Cohen & Ball, 1996). The need for a comprehensive curriculum and the resources to support its use is particularly great for novice teachers who are just learning their craft. With heightened standards for student performance and public demands for accountability, teachers increasingly expect a curriculum that is aligned with state frameworks and assessments. However, recent surveys reveal that often teachers lack both.

Although studies document teachers’ support for higher standards (Doherty, 2001; Public Agenda, 2003), fewer than half of teachers surveyed in one study said they “have ‘plenty’ of access to curriculum guides or textbooks and other materials that match state standards” (2001, p. 45). In an interview study of 50 new Massachusetts teachers, the majority reported that they “either had no curriculum at all—leaving them without
guidance about both what to teach and how to teach it—or a curriculum that included only lists of topics and skills—suggesting only very generally what to teach but not how to teach it” (Kauffman et al., 2002, p. 280). The materials they had often were not aligned with the frameworks or assessments. In 2003, Kauffman (2004) surveyed elementary school teachers in Massachusetts, North Carolina, and Washington. Three-fourths (75.4 percent) reported that they had not received sufficient curricular direction in at least one core subject, with the problem being more severe in science (56.2 percent) and social studies (69.2 percent), than in mathematics (20.5 percent) and language arts (31.7 percent). Grossman and Thompson (2004) report similar findings in their four-year study of novice language arts teachers. Research also suggests that, although most beginning teachers want to have rich and detailed curriculum materials, they expect to use them flexibly and resent efforts to regulate how they teach (Kauffman, 2004).

Whether or not schools provide an ample and aligned curriculum, many require teachers to spend substantial time on test preparation and they intensify pressure for higher test scores (Banicky & Noble, 2001; Doherty, 2001; Olson, 2001; Wong et al., 1999). Tye and O’Brien (2002) report that among graduates of one teacher education program, those who left teaching “ranked the pressures of increased accountability (high-stakes testing, test preparation, and standards) as their number-one reason for leaving” (p. 27).

Not only do new teachers seek guidance about what to teach, they also need instructional resources to conduct class day to day. Qualitative studies and popular accounts of teachers’ work repeatedly report that teachers lack basic supplies, such as textbooks, paper, pencils, paperback books, and supplies for science experiments (Corcoran et al., 1988; Johnson, 1990; Moulthrop et al., 2005). One study concluded that in 2001 teachers spent an average of $443 each on instructional resources (The National Education Association, 2003, p. 51), while another reported that first-year elementary teachers spent far more—$701 (Quality Education Data, 2002).

School organization and leadership

There is strong evidence that schools differ in the extent to which they support good teaching and learning, and that new teachers’ decisions about whether to remain in their school or in teaching often hinge on how well that school is organized and led (Johnson et al., 2004). Researchers frequently conclude that the success or dysfunction of schools results from the quality of the principal’s leadership (Rosenholtz, 1989; Louis et al., 1996; Bryk et al., 1999). Analysis of surveys of teachers new to Boston in 2003 showed that those who returned in September 2004 “felt that they received better support from their principals-headmasters than those who left after their first year” (Boston Plan for Excellence, 2005, p. 5). Analyzing data from the national Teacher Follow-up Survey, 2000–2001, Luens et al. found that over one-third (38.2 percent) of teachers who transferred to new schools reported that their dissatisfaction with “support from administrators” was either a “very” or “extremely important” reason for leaving their school. Research in Philadelphia also shows that new teachers leave schools that have neglectful or arbitrary principals (Useem, 2003).

The principal is important not only as the teacher’s direct supervisor, but also as the broker of working conditions throughout the school, linking it with the district office and local community and, in the process, garnering resources and ongoing support or generating opposition or unwarranted scrutiny. The principal often sets the tone for the school, be that one of collaboration and confidence or blame and defeat (Blase & Blase, 2004; Bryk & Schneider, 2003; Drago-Severson, 2004; Murphy, 1994).
Students

Since Lortie’s classic study of teachers in 1975, it has been clear that students introduce the greatest source of uncertainty in teachers’ work. Teachers repeatedly report that they enter teaching because they want to “help young people learn and develop” (Feistritzer, 2005) or to “work with young people” (National Education Association, 2003). In one study conducted by Public Agenda (2000), the primary source of satisfaction for new teachers who said they planned to continue teaching was their confidence that they were making a difference in the lives of their students. New teachers leave the profession when they find that they cannot achieve a “sense of success” with their students (Johnson & Birkeland, 2003).

Little effective teaching or learning can occur when schools are disorderly or dangerous. Over half of the teachers responding to a 2004 survey by the Public Agenda reported that there was a “somewhat serious” or “very serious” discipline problem in their school. One-third of the respondents said they had “seriously considered quitting the teaching profession because student discipline and behavior was such a problem” and the same proportion reported knowing someone who had left teaching for the same reasons (Public Agenda, 2004, pp. 43–44). Useem (2003) found that 52 percent of the third-year Philadelphia teachers in her sample who planned to leave teaching cited dissatisfaction with student behavior as the primary factor in their decision.

Some schools support effective work with students by endorsing strong, positive norms for behavior, providing extensive supports for students, and maintaining well-conceived, effective approaches to discipline (Johnson & The Project on the Next Generation of Teachers, 2004). Further, research suggests that when a school works closely with parents, there are instructional benefits for students and teachers (Bryk & Schneider, 2002; Dauber & Epstein, 1993; Rosenholtz, 1989).

Facilities

The literal workplace of teachers—the buildings and classrooms within which they teach—affects what they teach and their sense of security and comfort on the job. Although it would seem obvious that schools in disrepair are unfit for instruction, a surprising number of school facilities remain hazardous and ill-equipped, particularly in low-income communities (Carroll et al., 2004; General Accounting Office, 1995; Public Education Network, 2004).

Recent quantitative studies by Schneider (2003) and Buckley et al. (2004) focus exclusively on the role that facilities play in teachers’ work in Chicago and Washington, D.C. In addition to reporting wide dissatisfaction with the buildings, “more than one-quarter of the Chicago teachers and about one-third of the Washington teachers reported suffering health problems rooted in poor environmental conditions in their schools” (Schneider, 2003, p. 2). The researchers surveyed teachers about their career plans and found that “the probability of retention increases” as the “perceived quality of the school facilities improves, ceteris paribus” (p. 7). Although there is little evidence that teachers leave their school solely because it is in poor repair, Carroll et al. (2004) have found that such dissatisfaction contributes to turnover.

Thus, a seemingly straightforward factor—the state of repair of a school building—interacts with much more complex factors, such as the effectiveness of a principal’s leadership or the character of work with colleagues, to determine the overall quality of working conditions. Given the importance that teachers place on achieving success with students, poor working conditions that interfere with good teaching are particularly
noteworthy. Dissatisfaction with working conditions often fuels the discontent teachers already feel about low pay and prestige, and the combined result is increased turnover. When teachers of the retiring generation were disturbed by the pay and circumstances of their work, they had little option but to endure. However, today’s new teachers have many alternative options for employment, and early evidence suggests that, as a cohort, they are unwilling simply to cope while waiting for better times.

PROMISING APPROACHES TO RETAINING GOOD TEACHERS

Some approaches to attracting and retaining good teachers are obvious. If strong candidates are to enter and remain in teaching, they must be paid a decent salary that is competitive with what they might earn in a comparable field. Their teaching assignment must be fair and reasonable, making good use of their knowledge and skills. In deciding what and how to teach, new teachers need a curriculum that is well-aligned with standardized assessments, and they must have the resources required to teach that curriculum. They should be able to count on strong, knowledgeable and collaborative principals, who can ensure that the school is orderly and has the supporting services required to meet students’ needs. The buildings they work in must be safe, clean, and well-equipped. These are the basics.

However the priorities of the new generation of teachers suggest that more must be done if the best among them are to commit a substantial part of their career to public education. Given their inclination to make quick decisions about their career, more must be done to ensure that the school where they begin teaching offers a good match for their professional priorities. Given their need for collegial support and their preference for team-based work, profound reforms are called for in the egg-crate structure of their schools. Given their expectations for ongoing professional growth and expanded responsibility, new opportunities for career development are in order. Given their interest in linking performance and pay, efforts should be made to rework the standard salary scale. Currently some promising policies and practices are underway that begin to address each of these needs.

Timely and information-rich hiring

For many years, school districts—particularly large ones—screened and hired their teachers centrally and then assigned them to schools (Murnane et al., 1991). Implicit in this practice was the assumption that schools and teaching positions are essentially the same within a district, one placement being much like another. However, educators today recognize that schools differ in important ways, and that a teacher who is just right for one school might be out of place in another.

There is evidence that new teachers often decide whether to remain in the profession on the basis of their early experience; many of those who are dissatisfied with their first school simply leave teaching (McCarthy & Guiney, 2004). Although more districts today are moving to school-based hiring, which might lead to better matches between teachers and schools, recent research nevertheless suggests that the hiring process is often delayed and deficient (Liu, 2004).

Studies show that, on average, new teachers are hired late. A survey of new teachers in four states (Liu & Johnson, 2006) found that only one-third had their jobs more than a month before school started; one-third accepted jobs during the month before school opened; and one-third were hired after school began. Thus, most teachers had little time
to prepare for their new courses, curriculum, and students. Late hiring is especially common in large, urban districts (Levin & Quinn, 2003; Useem & Farley, 2004). In 2003, almost half of the new teachers in Boston were hired after September 1, and only 11 percent were hired before August 1 (Boston Plan for Excellence, 2005).

In addition to being late, hiring tends to be “information-poor,” with little exchange of information about what a school would expect from and offer a new teacher or what the new teacher might contribute to the school (Liu & Johnson, 2006). Inevitably, when hiring is late, rushed, and conducted haphazardly, poor matches result. Liu (2005) found that teachers who experience “information-rich” hiring and report having a good preview of their job, are more satisfied than teachers who did not.

Many changes in hiring practice are underway, particularly in large urban districts. These reforms are designed to increase the capacity of human resource offices to track candidates and make timely job offers, to streamline seniority-based transfer procedures that delay hiring, and to prepare schools for more effective site-based hiring (Johnson & Donaldson, 2006; Useem & Farley, 2004).

Mentoring and support

Formal mentoring programs for new teachers are often used to moderate teacher isolation and to support new teachers in their early years. Analysts conclude that, in fact, mentoring is good for new teachers (Berry et al., 2002; Evertson & Smithy, 2000; Feiman-Nemser, 1996; Humphrey et al., 2000; Ingersoll & Kralik, 2004; Wilson et al., 2001). Thus, policymakers, central office administrators, and school leaders have sponsored mentoring programs to induct new teachers, improve their effectiveness, and reduce their attrition. Recent analysis of NCES’s School and Staffing Survey data shows that induction and mentoring practices for new teachers have greatly expanded over the past decade (Smith & Ingersoll, 2004).

Studies show that new teachers who are mentored early in their careers are more effective (Evertson & Smithy, 2000; Feiman-Nemser, 1983; Humphrey et al., 2000) and are likely to remain in their schools or in teaching longer than those who are not (Humphrey et al., 2000; Smith & Ingersoll, 2004). In the ideal scenario, new teachers have mentors who help them meet the challenges of being a beginning teacher (Feiman-Nemser, 1983, 2001; Gold, 1996; Veenman, 1984). Mentors assist novice teachers as they decide what to teach and how to teach it, and help them manage classrooms and develop strategies for succeeding with particular students. At their best, mentors observe new teachers in their classroom, model good teaching, and share materials and ideas. In short, the ideal mentor’s work with the new teacher focuses on the central components of teaching: classroom instruction, curriculum and lesson planning, and classroom management (Darling-Hammond, 1999; Evertson & Smithy, 2000; Feiman-Nemser, 1983; Holloway, 2001; Humphrey et al., 2000; Smylie, 1994; Wilson et al., 2001). Mentors also help new teachers acclimate to the modes of professional practice in the school and acculturate them to the particular norms of their school and the families it serves (Kardos et al., 2001; Villani, 2002).

However, mentoring programs vary in origin and design. They can be statewide, district-wide, school-based, or informal (Feiman-Nemser, 2001). Some programs are shortsighted and ill-conceived and therefore difficult to implement, monitor, and evaluate. While most U.S. new teachers are currently assigned mentors, large proportions of them are inappropriately matched, are rarely or never observed in their classroom, and hardly ever discuss issues of instruction and lesson planning with their mentors (Kardos, 2004; Kardos & Johnson, 2007).
Researchers who study mentoring caution against assuming the simplistic view that the new teachers’ school-site induction needs will be fully met if only each is assigned an experienced teacher as mentor (Johnson & The Project on the Next Generation of Teachers, 2004; Kardos, 2004; Little, 1990; Stansbury & Zimmerman, 2000). However, thoughtful, carefully implemented, school-based mentoring programs can serve new teachers extremely well (Berry et al., 2002; Feiman-Nemser & Floden, 1986; Gold, 1996; Johnson & The Project on the Next Generation of Teachers, 2004; Villani, 2002; Wilson et al., 2001). The New Teacher Center, for example, which sponsors various initiatives to support new teachers, reports measurable success in their mentoring program (www.newteachercenter.org).

It appears that mentoring programs having certain features and being embedded in certain contexts are more likely to provide new teachers with the type of support they need. For example, mentoring programs are more likely to succeed if new teachers are matched with their mentors according to their subjects (Smith & Ingersoll, 2004). They are more likely to be successful if they are embedded in a professional culture that anticipates new teachers’ need for help, and not only encourages them to seek it out but also provides easy access to it (Feiman-Nemser, 1996; Johnson & The Project on the Next Generation of Teachers, 2004; Kardos et al., 2001; Little, 1990; Rosenholtz, 1989). New teachers are more likely to get the support they need when they experience mentoring as one feature among many in the context of an ongoing, comprehensive, school-based induction program (Johnson & The Project on the Next Generation of Teachers, 2004).

Differentiated roles and career growth

The prospect of a static and stagnant career in the classroom dissuades many from teaching, while the reality of a fixed and undifferentiated role for all teachers drives others from the classroom. Early research shows that few in the new generation expect to remain full-time classroom teachers over decades, even those who anticipate having a long-term career in education (Peske et al., 2001). Yet, the teaching roles that these new entrants seek—academic coaches, team leaders, mentors, or curriculum specialists—are only beginning to emerge as schools respond to new demands for student success (Mangin, 2005; Neufeld & Roper, 2003).

Career ladders for teachers, including differentiated roles for master or lead teachers, were first introduced in the 1980s. Despite great enthusiasm for their potential to improve schools and enrich the career of teaching (Carnegie Forum on Education and the Economy, 1986), they proved difficult to establish and sustain. Successful implementation of differentiated roles or a career ladder requires a district to create a credible, reliable selection process; establish roles and training for lead teachers or coaches; schedule teachers’ time to accommodate new approaches to professional development; and to ensure sustained funding and public support. Some studies show that career ladders have positive effects on teachers’ morale, commitment, satisfaction, and sense of efficacy (Ebmeier & Hart, 1992), while others report negative effects of increased stress, misdirected energy, and opportunism (Henson & Hall, 1993).

Although there is evidence that poorly implemented career ladders can introduce new problems (Rosenholtz, 1987), it is clear that many new teachers today seek the kind of differentiated role that career ladders might provide. Hart and Murphy (1990) found that new teachers with high promise and ability assess career ladders more favorably than those with lower promise and ability, suggesting that effectively implemented career ladders might be a mechanism for attracting and retaining strong teachers.
Career ladder programs sometimes falter because they have no means of selecting expert teachers for differentiated roles. However, the National Board for Professional Teaching Standards, which had certified 32,000 “accomplished” teachers by November 2005 (www.nbpts.org), offers a new method of selection that would be untainted by local patronage and politics and, in many states and districts, provide salary bonuses that might be integrated with a career ladder. Notably, over half of the teachers whom the Board had certified by 2004 were early in their careers, suggesting that there is a core of teachers in the new generation of teachers who seek recognition and compensation for their instructional expertise as well as the potential to influence education beyond their classroom (Berg, 2005).

Performance-based pay

New teachers regularly report their dissatisfaction with the standardized pay scale. Why, they ask, should effective and ineffective teachers be paid the same? (Johnson & The Project on the Next Generation of Teachers, 2004). However, like career ladders, merit pay plans have been hard to implement. Those introduced in the 1980s widely failed because they did not have defensible approaches to assessment, were poorly funded, or turned out to be no more than extra pay for extra work (Murnane & Cohen, 1986). New teachers express great interest in pay plans that would reward them on the basis of performance, but they remain skeptical that even-handed judgments will be made (Public Agenda, 2003).

Public support for merit pay is high today, although policymakers often recommend or mandate performance-based pay policies without resolving the difficulties and shortcomings experienced by failed plans of the 1980s. Nationwide, a few schools, districts, and states have implemented performance-based pay plans, although most are relatively small programs (see the web site of the University of Wisconsin’s Consortium for Policy Research on Education: www.wcer.wisc.edu/cpre). Large unionized districts have encountered more difficulty designing and gaining approval for such reforms. For example, in 2000, Cincinnati approved a comprehensive performance-based pay plan in collective bargaining. However it was abandoned two years later, before it was fully implemented when the teachers challenged the quality of the evaluation process on which the plan was based (Keller, 2002). Currently, the Denver Public Schools, in partnership with the local teachers union, is implementing a pay system that rewards teachers with bonuses for a variety of skills and behaviors, including completing relevant courses or degrees, earning National Board Certification, receiving a satisfactory evaluation, teaching in hard-to-staff schools or subjects, and teaching in classes and schools where students demonstrate progress on standardized tests (Jupp, 2005). Each accomplishment adds additional pay to the teacher’s base salary and there is no limit on the number of bonuses that can be earned or on the number of teachers who can qualify. Denver piloted and refined this program over four years and subsequently teachers voted to approve it. In November 2005, Denver voters approved a property tax increase needed to fund the program. Although initial experience with the plan is encouraging (Slotnik, 2005), it is not yet clear whether this plan can be sustained over time financially, organizationally, or politically.

Ideally, merit pay plans for teachers would rest on evidence of students’ learning, although currently there are no measures of student learning that all parties agree are legitimate. Critics contend that standardized tests are flawed because they provide only narrow or misguided measures of teaching and learning (Kohn, 2000). Nonetheless, the introduction of “valued-added” measures of teachers’ performance, which analyze the
standardized test scores of their students over a number of years (McCaffrey et al., 2003; Sanders & Rivers, 1996) offer the prospect that teachers eventually might be paid on the basis of their students’ performance (Carey, 2004).

CONCLUSION

If public education is to ensure that all students have able and committed teachers, policymakers and practitioners must comprehend the enormous challenge of attracting and retaining a new generation of teachers. Because of transformations in the job market and society, there is no longer a steady supply of men of color and women to replace the large number of teachers due to retire by 2010. Public schools must now compete with all other workplaces for talented employees, and the evidence suggests that they are ill-equipped to do so. Prospective teachers today, who have many employment options in various lines of work, critically assess their opportunities. What will they earn and what kind of work environment will they have? In order to successfully recruit these individuals, schools must respond to their desire for a workplace that supports successful teaching and learning. Those who enter the classroom expecting more than they find may well leave after a short time. Moreover, because workers nationwide are far less likely today than 30 years ago to commit to a lifelong career in any field, schools must change in order to accommodate the frequent entry and exit of teachers.

Schools are remarkably resilient organizations that generally do not change rapidly or deeply, and are more likely to adopt reforms reluctantly and gradually, if at all (Tyack & Cuban, 1995). Therefore, it seems unlikely that they will respond quickly or adequately to the current labor market for teachers or to the priorities of those entering teaching today. Some reforms being adopted by various states, districts, and schools offer promise, but there is no certainty that schools can fulfill the public’s goal of truly educating all students.

INTRODUCTION: FRAMING THE ISSUE

The current teacher education context

Without a doubt, the issue of teacher quality is currently one of the most pressing concerns expressed by policy makers, the media, the public at large, and by educators themselves. Within the national educational discourse, there are a multitude of opinions about how teacher quality should be defined, and these opinions are not only varied but often contradictory. We are immersed in debates regarding what teachers should know and be able to do, the qualities and preparation teachers should have, where teacher preparation should take place (if at all), and what this preparation should include—or exclude (Berry et al., 2004; Cochran-Smith, 2001b; Cochran-Smith & Fries, 2005; Lasley et al., 2002). The widespread perception that teaching ability is more innate than learned continues to fuel arguments that pedagogy is unnecessary and that good teaching relies primarily on content knowledge and “verbal ability” (Goldhaber & Brewer, 1995; Hess, 2004; Kanstroroom & Finn, 1999; U.S. Department of Education, 2002; Walsh, 2001). In contrast, others—particularly educators—are of the opinion that learning to teach is complex and difficult and requires the acquisition of specialized knowledge and professional methods through formal study and apprenticeship (Cochran-Smith, 2004; Holt-Reynolds, 1999; Monk, 1994; National Commission on Teaching and America’s Future (NCTAF), 1996, 1997; Shulman, 1987).

It would be difficult to succinctly characterize or categorize the wide range of opinions, debates and public policy discussions surrounding what constitutes teacher quality. However, these discussions all appear to uniformly define learning to teach and teacher assessment as a process of inputs and outputs. Inputs include academic credentials and professional knowledge such as GPA, content majors, subject matter knowledge, pedagogical knowledge, field experience, instructional methods; outputs include so-called indicators of teacher knowledge and quality such as performance on teacher tests, students’ standardized test scores, artifacts and work samples and teacher certification. Such variables are assumed to be indicators of quality and consequently, much of the research seeking to identify predictors of teacher quality has focused on describing what candidates know or the characteristics and skills they do or need to possess before certification (inputs), and what candidates do or how they perform after certification (outputs) (Zumwalt & Craig, 2005).

Undoubtedly, the relationship between teachers’ knowledge and skills prior to or upon certification, and teachers’ performance post-certification is critical to understanding what separates a quality teacher from those unqualified. This kind of “impact research”
has been called for, yet such research is far from plentiful or definitive (Cochran-Smith & Zeichner, 2005; Zumwalt & Craig, 2005). Indeed there continues to be differences of opinion about whether teacher certification does have an impact on student outcomes. Thus, research and scholarship supporting the positive impact of teacher certification and preparation on student achievement sits alongside reports that argue the exact opposite (Darling-Hammond, 2000, 2001; Darling-Hammond et al., 2002; Darling-Hammond & Youngs, 2002; Fetler, 2001; Goldhaber & Brewer, 2000; Walsh, 2001; Wilson & Youngs, 2005; Zumwalt & Craig, 2005). Still, these differences of opinion aside, teacher certification continues, apparently, to be perceived as a gatekeeping mechanism that controls who can enter into the profession, and as a key indicator of teacher quality. Thus, even those who have called for the dismantling of formal or university-based teacher preparation, have also implicitly supported teacher certification. For example, former secretary of education Rod Paige defines teacher certification as “broken” but still recommends that “states will need to streamline their certification system” (U.S. Department of Education, 2002, p. 40), and the language of the No Child Left Behind Act of 2001 (NCLB) (Pub. Law 107–110) underscores the need for quality teachers, defined in large part as state certified teachers (Cochran-Smith, 2004).

As teacher educators who prepare candidates to be certified, we agree that teacher certification is a crucial aspect of any definition of teacher quality, and through our work we enact our belief that a teacher with certification is ultimately more qualified than someone who practices without certification. Of course we acknowledge that possession of teacher certification does not imply a certain (or minimum) level or length of preparation—or any preparation at all—given the existence of alternate routes to certification which vary greatly in terms of requirements and standards. Still, in this discussion, it is important for us to position ourselves from the outset as teacher educators who have been classroom practitioners and who work in a university-based teacher preparation program. Thus, we stand behind the necessity for formal, professional study prior to entry into the classroom (and certification), and see teaching as work that demands specialized knowledge and skills. So our purpose in this piece is not to debate the value of formal teacher education—we believe it is essential to the development of good teachers, a stance that consciously underlies our chapter. However, we worry that measures of teacher quality that rely solely on inputs and outputs leave unexamined a major dilemma in teacher preparation—how do teacher educators know when a preservice student teacher is ready for independent practice or certification? Given our on-the-ground work in the preparation of teachers, our perspective regarding teacher quality naturally encompasses the space between inputs and outputs, and causes us to ask different questions about teacher quality. What indicators do teacher educators look for? What kinds of gatekeeping mechanisms are in place—at entry, during coursework, during fieldwork and at completion? Do certain characteristics or dispositions figure into whether a teacher candidate is ready to—or can—teach?

In this chapter, we wrestle with the question of teacher quality from the perspective of teacher educators who must decide during the learning-to-teach-process which teacher candidate can continue in the program through to a recommendation for certification, who might continue given additional support and intervention, and who must be barred from teaching practice. These questions illuminate the issues and dilemmas teacher educators must resolve on the journey towards certification which represent a missing component of the national discussion about teacher quality. Yes, it is important to know about what happens when teachers finish their program, but we argue that it is equally important to analyze the decision-making points and assessments that teacher educators use to answer the question, who is ready teach? However, little scholarship currently
exists to help policy-makers and researchers understand the local practices that programs routinely use to separate competent from incompetent teachers. Our chapter then, targets two major areas: (1) front end requirements for entrance into programs; and (2) assessment and support mechanisms related to readiness to teach. Each area connects to a specific question—who is fit to teach? who is ready to teach?—and takes us across university sites to examine the role teacher educators play as gatekeepers for the teaching profession.

Our chapter begins with an overall description of the structure, role, and function of teacher education programs vis-à-vis the certification process, both historically and contemporarily. We then present practices, procedures, policies, and assessments that teacher preparation programs employ as they make decisions about teacher candidates’ readiness to teach and the dilemmas and issues teacher educators face as they make these decisions. For this documentation and analysis, we rely upon three sources: (1) peer-reviewed scholarship from the last ten years; (2) data from structured interviews with 12 teacher educators representing a range of institutional types and geographic regions; and (3) examples from our own teacher education program. Using these bodies of information, we present ways in which the field can conceptualize what we are calling the gatekeeping function of teacher educators. Our chapter ends with recommendations for research.

The structure, role and function of teacher education in the teacher certification process

There is no shortage of condemnation of teacher education—what it should or should not do and whether it should even exist (Ballou & Podgursky, 2000; Berliner, 2000; Hess, 2004; U.S. Department of Education, 2002; Walsh, 2001; Weitman & Colbert, 2003; Zeichner, 2006). However, almost from the start of formal teacher preparation, criteria and requirements for teacher licensing and certification have been mandated from outside the academy by boards of education and state departments (Conant, 1964; Hodenfield & Stinnett, 1961; Koerner, 1968; Wilson & Youngs, 2005), a practice that has continued through to the present (Darling-Hammond & Cobb, 1995; Goodlad, 1990; Tom; 1996; Wayne & Youngs, 2003). In fact, a look at current state certification mandates reveals a move towards additional regulation, so that “new regulations represent unprecedented moves to establish external control of nearly every aspect of teacher preparation” (Cochran-Smith, 2001b, p. 264). Thus, it could be said that teacher educators find themselves the brunt of criticism for a situation not entirely of their own making and not entirely within their control as they respond to standards and curriculum guidelines laid down by bodies that govern teacher certification rather than by those who engage firsthand in the preparation of teachers.

This external governance of teacher education is the likely reason why teacher education programs across states are remarkably similar in terms of structures and requirements, and remarkably dissimilar in terms of certifications offered, individual practices and interpretations of standards. Typically, teacher preparation programs encompass four components: general or content knowledge, the foundations of education, professional knowledge and methods, and field experience. But the implementation and practical enactment of these four components can—and does—differ widely across and within states, because neither course titles nor program descriptions can truly indicate what individual faculty do in their own classes or within their own programs. This perhaps explains why there is widespread disapproval of teacher educators’ work at the same time that “for most of the 20th century, candidates were eligible for certification
as long as they completed a state-approved teacher preparation program” (Wayne & Youngs, 2003, p. 90).

This should not be construed as criticism of teacher educators or of state authorities. The reality is that no matter how tightly regulated teacher education is, short of prescribing every aspect of the teacher preparation curriculum, state agencies are not in the position financially or personnel-wise to oversee every minute aspect of every program (even if they were inclined to do so). Thus, state departments and teacher education programs enter into an explicit agreement—states agree to certify those individuals that teacher education programs endorse if teacher education programs comply with preparation requirements dictated by the state. In essence then, teacher educators become gatekeepers for the state as well as for the profession, assuring the state that candidates recommended for certification will have met the state’s criteria for “quality.” This means that programs must articulate to varying state mandates as they engage in the day-to-day work of judging the fit and readiness of individual candidates, which, in turn, requires teacher educators to erect several gatekeeping hurdles in the form of varying experiences, requirements, assessments, and supports for students as they progress through the program.

**Examining gatekeeping: integrating the literature with data from the field**

As we began this work on the practices of gatekeeping, we were struck by the dearth of literature, documentation or research on these varying experiences, requirements, assessments, and supports for students employed by teacher educators in their individual programs to determine fitness to teach—who gets into teacher preparation—and readiness to teach—who is allowed out into the profession. Spanning the last ten years, literature that does address this issue, while minimal, offers some important insights about teacher exams, field-based assessments, and approaches to understanding and theorizing student teacher competence and incompetence. Seeking to expand upon this literature and to portray some typical programmatic practices around fit and readiness to teach, and then analyze common issues surrounding these decisions, we held twelve telephone conversations with teacher educators around the United States focused on questions of program structure, decision-making, and practices that fall under the rubric of “gatekeeping.” Although not designed as a representative sampling, or even a systematic research project, we did use three criteria in generating our list of twelve program contacts: (1) a focus on elementary education programs as a way to delimit our inquiry (given our own program experience); (2) regional diversity, knowing that state mandates differ widely and are often the source of at least some requirements related to fit and readiness; and (3) variety of institutional types, using AACTE’s (American Association of Colleges for Teacher Education) categories.

Table 27.1 portrays the regions and institutional types we contacted by telephone. Promising confidentiality to our colleagues, we are not including the name of the institution, although we did have conversations with people from New York, New Jersey, Massachusetts, Pennsylvania, Florida, Kentucky, Ohio, Illinois, California, Utah, and Alaska. The programs ranged in size from very small, certifying 25 or 30 new teachers a year, to those which were quite large and prepared several hundred teacher candidates per year. Conversations lasted anywhere from 20 minutes to over one hour and were based on a list of questions (Appendix 1) that we had sent each respondent ahead of time. Many of these colleagues were people we know, but some of the people with whom we spoke were solicited because of the institutional type (using Peterson’s on-line index) or region (using AACTE’s categories).
What emerged, and what we present below (interwoven with a review of the literature) was a fascinating portrait of a wide range of program practices, some influenced by state requirements, many emerging from the students enrolled in their programs, some in place because of long-standing collaborative relationships with school districts, some due to organizational structures of the wider universities, and a few based on long-range planning by faculty involved in the teacher education program. Although we found it quite interesting to compare practices and problems across programs, we do not present a list and description of these practices, but rather, we seek to analyze issues that cross the various contexts.

FIT TO TEACH? CONTENT KNOWLEDGE AND ACHIEVEMENT

The importance of content knowledge and academic achievement has been much debated and discussed in reference to teacher preparation in the United States. Although no one will disagree that knowledge of content is central to good teaching, it is much harder to determine which content knowledge is of most value and then agree on valid and reliable measures of achievement. While this critical debate is beyond the scope of our chapter, it is important to note that many teacher education programs emphasize content knowledge and achievement by requiring specific university coursework, using student GPAs for admission or continuation in their programs, and stipulating higher scores than the state’s cut-off on teacher exams. The programs we spoke with are no exception: most require minimum GPAs of 2.75 (the range was 2.5 to 3.0); more than half have course prerequisites (typically involving a practicum or field placement) or require applicants to achieve a minimum grade in specific courses prior to admissions (usually, these are basic skills courses such as English and mathematics); eight of the twelve require applicants to take or pass some form of standardized test such as Praxis I to demonstrate basic skills or content knowledge (primarily), or in lieu of SATs or ACTs.

State requirements and teacher exams

While teacher education programs within particular states can show great variation in their interpretations and implementations of state guidelines for approved teacher education programs, the requirement of passing standardized teacher examinations is one that
is most common, least open to interpretation, and in most cases is not subject to negotiation. Although 42 states have licensing exams required for certification (Cochran-Smith & Zeichner, 2005), many also require teacher education programs to measure fitness to teach through the Praxis Series, developed by the Educational Testing Service. As of 2003, 30 states and the District of Columbia required the Praxis I—or Pre-professional Skills Test (PPST)—for either entrance into teacher education programs or licensure (Educational Testing Service, 2005).

Common practice notwithstanding, researchers of teacher education have raised critical questions about the usefulness and validity of Praxis I as a tool to sort qualified from unqualified teachers and teacher candidates (Cobb et al., 1999; Garcia, 1987; Mitchell & Barth, 1999). Although the PPST was developed and is used to identify students likely to succeed in teacher education programs, the subtests themselves—which states often specify with specific “cut-scores” (Educational Testing Service, 2005)—have not proven valid for separating students who succeed in teacher education programs from those who fail (Memory et al., 2003; Mikitovics, 2002; Wilson & Youngs, 2005). Furthermore, three studies undertaken to explore the relationship between students’ PPST scores and student teaching evaluations could find none (Mikitovics, 2002).

Most disturbingly, however, the PPST does function as an identifier by ethnicity, and the “supply of minority teacher candidates appears to be negatively affected by the use of PPST as a screening device” (Mikitovics, 2002, p. 221; see also Wilson & Youngs, 2005; and Zumwalt & Craig, 2005). Although few programs or states use only a standardized assessment measure to determine entry or licensure, cut-scores and passing scores are often set by state regulations, leaving individual teacher preparation programs little leeway in balancing performance assessments with standardized ones. Strong warnings have been sounded by researchers such as Strosnider and Blanchett (2003) that such practices not only violate the recommendations of the American Association of Colleges for Teacher Education (AACTE 1992, 1999), but can also be seen as resulting in discriminatory practices. With this, and other state-mandated requirements, we can see how teacher education programs function within certain constraints that do not necessarily place the teacher educators as the creators of the gatekeeping mechanisms. We are, however, mandated by our agreements with state licensing authorities to enact the decisions of regulatory agencies.

Still, admission is not the only gatekeeping point in teacher education programs: in our sample, the programs in Florida, New Jersey, Kentucky, Alaska, Massachusetts, Illinois, and California also use teacher tests such as the Illinois Assessment of Professional Teaching, as well as basic skills tests such as the MTEL (Massachusetts Test for Educator Licensure) literacy test for entrance into student teaching or for certification recommendations to the state. Thus, one very strong gate that we do see in teacher education programs is attaining a particular score on a state-mandated standardized exam. Said one teacher educator in our sample, “(the basic skills test) keeps them from getting in (to the teacher preparation program), and the general knowledge test keeps them from getting out (i.e. graduating and getting certified).”

Accordingly, many programs offer a variety of “test-prep” supports. Some programs in our sample offer tutoring to individual students, and others offer non-credit classes for students to develop their test-taking skills. However, such measures are not always sufficient to ensure that all candidates are able to move forward. One program coordinator explained that although students are sometimes able to pass the first standardized test which admits them into the College of Education, they are not able to pass the next exam which allows them to student teach, or the final exam that is required for the capstone course that follows student teaching. As she explained, all students are required to pass
each test before moving forward. No exceptions are granted. She termed this state mandate the “100 percent solution,” and added that if a student fails the test three times, it is very unlikely that she or he will ever pass it.

Academic difficulties beyond testing and GPA

Assessing teacher candidates’ content knowledge and achievement through tests and GPA is no guarantee that they will be able to be successful in teacher education courses that often require extensive writing and critical analysis, or K-12 classrooms that require a wide range of skills and knowledge. Such skill deficits are fairly easy to spot (based on weak papers and course assignments, or frequent errors with students) but are quite troubling and perplexing for teacher educators to handle. Thus, related gates tend to be more idiosyncratic and local; for instance, many universities have writing programs or tutorials designed to help students with the demands of academic writing. One program director with whom we spoke described students who were required to take time away from the program and remediate basic skill deficits through community-college programs. However, most of the pin-pointing of academic skill deficits is conducted on an ad hoc basis, and remedial interventions are similarly ad hoc.

The issue of academic performance is sometimes intertwined with a diagnosis of learning disabilities. Complying with the Americans with Disabilities Act (P.L. 101–336), campuses have varying levels of supports for students with diagnosed disabilities. Yet, there is little research or documentation of how programs think about fitness and readiness to teach of teacher candidates with disabilities. Of course, under Section 504 of the Rehabilitation Act of 1973 (P.L. 93–112), employers are required to make reasonable accommodations. Yet if an elementary teacher cannot read out loud, will the school district be willing to have the teacher use recordings or guest readers? What is the role of teacher education programs in advising students with disabilities who seek to become teachers?

One group of researchers studying preservice teachers with learning disabilities points out that field placements may require special consideration. They advise that preservice students be exposed to the realistic demands of teaching, but be placed in classrooms where their strengths can be maximized (Wertheim et al., 1998). This entails a careful needs assessment of both the student teacher and the receiving classroom. Additionally, these same authors have a set of important recommendations for the student, including ways to foster honest and on-going communication with the cooperating teacher, supervisory and teacher education faculty about specific and individual needs.

This careful attention to clinical experiences is often required with other disabilities such as deafness and blindness. For instance, a Deaf student teacher who recently graduated from Teachers College did her general education placement (required by New York State for special education certification programs) in an elementary classroom with only hearing children. Two interpreters worked full-time with this preservice teacher, one voicing what she signed to the students, and the other signing what the children said. Is this a “reasonable accommodation” as required by Section 504? Although there are some court cases that set precedent and can offer guidance for program faculty, in most cases, we make these decisions at a very local level.

Sometimes such decisions are made in the midst of crisis; in our own program we have found an increase in the number of students who are receiving medication and/or psychotherapy for mental health issues. Even students without disabilities are often seriously challenged by the rigors and stress of student teaching. As Shively and Poetter note, “Student teaching can be overwhelming, extremely difficult, even harrowing. Difficulties
in one or two areas can seem to drag down the entire experience” (2002, p. 294). When student teachers are unable to meet program demands due to mental health issues, what is a reasonable accommodation? There is little guidance forthcoming on this issue from the law, the states have not yet weighed in with regulations in this regard (nor would we want them to!), and yet, many teacher education programs face decisions each year about how best to respond to and accommodate preservice teachers whose mental health is compromised during (and perhaps due to) student teaching.

When asked what particular student problems, challenges, and dilemmas they face, many of the twelve faculty with whom we spoke mentioned psychiatric disorders, mental health issues, or emotional needs. Frequently, we heard stories of students’ crises from the field. Often, program decisions are made with the assistance of legal counsel, who let the program know if removing the student from the program is an option, or if they need (legally) to be given another field placement because the case is not strong enough to support removal. In almost all cases, faculty spoke of interventions and counseling services that are recommended or required. In many cases, once the student receives the appropriate treatment, s/he is able to re-enter the program and successfully complete the certification program. In a recent case from our own program, after an emergency hospitalization, increased family support, and a change in medication, the student was able to complete her field work requirement successfully.

Language proficiency and fitness to teach

As the number of immigrants in this country continues to rise, the number of English Language Learners enrolled in teacher education programs increases. Many programs across the United States—particularly in larger East and West Coast cities—have students who speak a first language besides English. Various programs have a language requirement or courses related to English or speech; one program from our conversations—located in a high-immigration area—requires the TOEFL (Test of English as a Foreign Language) as a requirement for entrance for all students whose first language is not English.

At one university, the elementary program includes an interview as a requirement for entrance into the program, a requirement mirrored by several other programs in our sample. At this particular university, the interview was developed in the 1990s to find out about spoken language ability, not as a gate for program acceptance, but rather as a way to recommend remediation. Currently, however, due to an increase of students in their program, the interviews are group interviews and the possible English language services are weak or non-existent. Since the university does not have “good mechanisms for language remediation,” and faculty are not comfortable turning students down because of English language proficiency, this is a very “sensitive issue.” Thus, students are admitted into the program and most do quite well in the university-based coursework; however, when they become student teachers, their English language production sometimes becomes a barrier to successful ratings from cooperating teachers and supervisors. When this occurs, students are given a different placement or are required to spend additional semesters student teaching.

ADVOCACY vs. GATEKEEPING

Given our discussion thus far, it is easy to see how decisions about fitness and readiness to teach resist simple formulas, scores on exams, or grade point averages. These questions
are entangled with cultural/political values and with program organization, design, and resources (for example, would all programs be able to provide two full-time American Sign Language interpreters for a Deaf student teacher?). Clearly teacher education programs have responsibilities to not only determine fitness and readiness to teach, but to also scaffold students’ fitness and readiness. As the above examples demonstrate, there are many students who need extra support, resources, and accommodations because of individual circumstances. Thus, teacher educators assume the dual role of helping students construct their teaching identities and knowledge and skills of teaching, while at the same time serving as gatekeepers for the state and the profession.

This dual role is explored in some detail by Paris and Gespass (2001) who document the tensions that arise when teacher educators must measure student teachers’ discrete behaviors against set standards while attempting simultaneously to be learner-centered. They conclude that ultimately teacher educators’ gatekeeping role dominates, resulting in a “technical rationality that emphasizes the uncritical performance of generalizable teaching strategies” (p. 398).

Similarly, seeing the potential conflict between scaffolding the developmental process of learning to teach and simultaneously having to recommend—or not recommend—for licensure, researchers from Minnesota (Page et al., 2004) used case studies of student teachers to explore the relationship between gatekeeping and advocacy in teacher preparation. They explain the gatekeeping role of the teacher educator is to, “clarify and enforce programmatic expectations; implement learning plans and probationary procedures; [and] counsel candidates into other areas of study” (p. 37). Concerned that their gatekeeping did not prematurely dismiss students from the program, and that their advocacy did not license inadequate teachers, the authors analyzed specific student teachers’ cases along two dimensions: ability (GPA, course exams, performance tasks) and teachability (openness to feedback and self-reflection). With students who present as having low ability and also low teachability, teacher educators must assume the role of gatekeeper. It is the combination of low ability and low teachability that can result in students not meeting minimum program expectations.

The judgment of minimum standards or program expectations requires summative evaluation by program faculty. Yet, Raths and Lyman (2003) claim that teacher education programs do not necessarily always do a good job of ferreting out incompetent teachers. Many evaluations throughout teacher education programs are formative in nature (e.g. portfolios and observations) and often the roles of formative assessor and summative assessor are conflated, which is one reason why incompetent students are sometimes recommended for certification (Raths & Lyman, 2003). Other explanations include: those making summative judgments about student teachers often occupy “minor roles within the larger teacher education setting”; pressure from students, parents, and lawyers to back down on decisions made that have career altering consequences; and a “rhetoric of excellence” that often pervades student teaching evaluations with benchmarks such as superior and excellent (p. 208; emphasis in original).

One reason why teacher educators conflate formative and summative assessment may be a key assumption undergirding teacher educators’ work—that learning to teach does not rest on techno-rational skills (Hinchman & Oyler, 2001; Paris & Gespass, 2001) or proceed in a linear, predictable fashion. Rather, we know that learning to teach is complex, contextually specific, autobiographically grounded, and informed by socio-political understandings (Goodwin 2002a, 2002b). Accordingly, we do not expect to see students progressing at predictable rates or steps during field placements. We spoke with many faculty (and see evidence in the literature) of strong gates to exit student teaching successfully. However, the other program assessments are not typically used to keep students
from graduating, from certification, or from continuing in the program. Rather, they are used to scaffold students’ success, thus acting as advocacy mechanisms, rather than gatekeeping devices. We are referring here to typical program assessments such as portfolios, disposition checklists, action research projects, reflective journals, and culminating projects. Students, of course, experience these assessments as stressful, often challenging, and sometimes anxiety-producing. However, we have found no evidence in the literature, nor in our informal conversations with colleagues, that such assessments are ever gates that keep students from moving on. Therefore, much of our own efforts in scaffolding field-based experiences in learning to teach must center on designing specific interventions when difficulties do arise.

**READINESS TO TEACH: FIELDWORK AS A GATE**

Evaluations of students’ progress in teacher education programs must be understood in relationship to the multiple stakeholders with whom teacher educators work. Our programs are: subject to agreements with our respective state departments of education, usually dependent on approval by national accrediting agencies (such as NCATE), and always functioning within larger college or university guidelines and standards. Preservice students must be evaluated by us for both licensure and degree requirements, and both of these are dependent on successful completion of fieldwork.

This responsibility—that embeds decisions about graduation and licensure in evaluations of clinical experiences—increases the significance of teacher education assessments and requires that they not be only formative in nature, but demands they also be summative. However, there is little research available that documents or analyzes our assessments in light of high-stakes decisions, such as graduation and licensure. Instead, teacher educators have been strangely silent on this matter.

**Student teaching: measuring competence, deciding incompetence**

State Departments of Education do not typically outline how to measure satisfactory performance in the required field work experiences. Although states usually specify the minimum number and length of field experiences, they have not explicitly defined what it means to be a competent student teacher. Yes, many states have developed standards to which they hold individual teacher education programs and individual teacher candidates responsible, and some states even require that teacher candidates submit evidence to their programs of satisfactory performance in each standard. However, it is obviously much harder (if not impossible) for states to judge the performance qualifications of individual teacher candidates. It is that judgment that has been placed in the hands of teacher educators via state-approved programs.

Certainly, the student teaching experience is understood by teacher educators and teacher candidates as a centerpiece of the preparation experience. Although some literature exists delineating what makes a “good” student teaching experience (Beck & Kosnick, 2002; Cochran-Smith, 1991; Koerner et al., 2002; LaBoskey & Richert, 2002), there is little research documenting how programs evaluate teacher candidates’ performance and subsequent readiness to teach during and immediately after the student teaching experience, elaborate practices (supervisors, observations, check-lists, evaluation forms, etc.) notwithstanding.

A few case studies or narrative accounts of student teaching difficulties have been published or presented that illustrate some of the challenges and decision-points that
teacher educators face in assisting students along the developmental continuum to become a teacher (Dubetz et al., 1997; Gray, 1998; Oyler et al., 2001). Still, cases of individual students being removed from field placements are scarce in the research on learning to teach, or are mentioned but not elaborated upon.

When students are evaluated as not successful in student teaching, various studies report that they may be asked to withdraw from student teaching, or may be allowed to re-enroll in student teaching in a different semester (Farkas & Johnson, 1997; Johnson & Yates, 1982; Knudson & Turley, 2000; Raths & Lyman, 2003; Sudzina & Knowles, 1993). However, as Sudzina and Knowles noted (1993), “teacher educators rarely talk about ‘failure’ in their programs,” . . . perhaps because it is “unwelcome, unanticipated, and often embarrassing” (p. 254). Thus, incompetence, and the reasons behind it, is not well theorized, operationalized, or explored in the scholarship from inside teacher education.

Accordingly, Raths and Lyman (2003) offer a “classification scheme of teaching behaviors—ranging from the most egregious to those representing good practices” (p. 210). Their continuum includes: criminality, malpractice, lack of basic skills, incompetence in teaching, plain teaching, and teaching with best practices (p. 214). Clearly, it is the categories in the middle (lack of basic skills, incompetence, and plain teaching) that offer the greatest challenge to teacher educators. To that end, these authors also include a 2-page chart with “Indicators of Incompetence in Student Teaching” (2003, pp. 212–213) designed to help teacher educators counsel out preservice teachers who are not exhibiting evidence of competency in the field.

How students are identified to be “at risk” was the focus of a study conducted in California (Knudsen & Turley, 2000). In this study of two teacher education programs at one university, the supervisor was the person who raised a concern in 50 percent of all cases. The reasons that students were red-flagged differed depending on the point in both the program (first or second placement) and in the semester, but included: problems with instructional strategies, difficulties with either the supervisor, the cooperating teacher, or the university requirements, not managing time well, difficulties establishing management skills or rapport with students, lack of knowledge of subject matter, or incompatible ideas of what it meant to be a teacher.

Interventions

Making the decision to not recommend a candidate for certification is a difficult one. Although not all the programs with whom we spoke had experience with this, the ones that did all remarked about the time and energy involved in this process. In our own program, we spend enormous numbers of hours developing special intervention programs for and with student teachers experiencing difficulty in field work. What is clear to us from both our interviews with colleagues and our own experience, is that the needs of certain preservice teachers often consume much additional time, require greater program flexibility, and challenge the capacity of typical university services. As one colleague told us, “For one student with a problem, it could take 50–100 hours to resolve.”

The judgment of when it is “appropriate” to intervene, and what interventions are developed is, of course, a local program decision. Although state mandates are clear regarding teacher certification exams, and sometimes even detail standards to meet, the day-to-day decisions about readiness to teach remain squarely in the hands of teacher education programs.

How programs intervene to assist “at-risk” student teachers, is an area that has received little focused attention in studies of preservice teacher education. According to Sudzina
and Knowles (1993), “A major weakness in the literature on “failure” is the lack of attention to collective programmatic actions and the consequences of particular preservice teacher education practices within institutions” (p. 256). Depending on the severity of the issue, students may be required to demonstrate they have taken specific courses, or received specific treatment as a condition of continuing in the program; for instance, one student teacher who went to two different placements obviously inebriated and was removed twice from student teaching, was required to show evidence of substance abuse treatment before being considered for re-admission.

When the problem that surfaces is most egregious—what Raths and Lyman (2003) would term criminality or malpractice, the decisions are more straightforward. They often involve consultation with university lawyers, but offer little confusion to faculty regarding an appropriate line of action. The student is removed from the placement, often exited from the program, and sometimes dismissed from the university. Of course, we also realize that given the large number of “back-door” routes to teacher certification, it is possible that students we have failed and even dismissed find other ways into teaching.

Drastic cases involving such egregious behavior are thankfully rare (according to our anecdotal evidence; again this has not been a subject for systematic inquiry), and call for fairly unambiguous decision-making. Much more commonly, when we need to intervene, it is with a student who falls into one of the next categories of Raths and Lyman’s typology (2003): unethical behavior; lack of basic skills; incompetence as a teacher; and even “plain teaching,” defined as strong in one or two areas, but overall “mediocre, uninspiring, and tedious” (p. 214).

Similar to the majority of programs with whom we spoke, when a student is rated below satisfactory for student teaching, in our program we will require a third, or sometimes, even a fourth placement. Completing this additional placement, however, is no guarantee of success. Although continued poor ratings from new supervisors and new cooperating teachers does help make the teacher educator’s case stronger, it provides little comfort for the prospective teacher. Particularly challenging in these cases is the large amounts of time and money that have been invested up to the point of final decision. Because of this, over half of the programs with whom we spoke have developed, or are developing, degree programs that offer graduation without certification. This is typically an “Educational Studies” degree and the program recommendation for certification is withheld.

However, this action is not without consequence. Students in possession of a university degree that includes education course work can—as we mentioned earlier, and our colleagues echoed—still find ways to achieve “certification” via emergency, temporary, or alternative routes, and/or enter the classroom, especially in hard-to-staff schools or shortage areas such as special education or science. A number of our colleagues, especially at the undergraduate level, also related stories of angry parents, anxious university administrators, and subsequent communication from lawyers seeking to overturn the negative decisions. Accordingly, the most common practice when dealing with students experiencing difficulty at any point in our teacher education programs (but particularly at the fieldwork stage) is the strategy of “counseling out.”

“Counseling out” is a skill that many teacher educators hone over the years and refers to the common practice of advising preservice students of other academic and career options available besides the certification programs in which they are enrolled. Again, we could find no systematic data or study of this practice, although in our conversations with all the teacher educators, this was a practice in which we had all engaged, and was recommended by researchers of teacher education (Sudzina & Knowles, 1993) as “direct exit counseling” (p. 261).
Other steps short of not recommending for certification and counseling out, are developed by the individual teacher education programs and may include changing supervisors or cooperating (mentor) teachers, or bringing in faculty for the creation of individual action plans. One university has developed a “Communication of Concern” form that can be filled out by university professors, PDS faculty-school liaisons, or the cooperating teacher. These forms are placed in the students’ files and serve as data if “Intensive Action Plans” need to be created for individual students.

Whatever the student teaching problem, and regardless of the planned intervention, this is time- and emotion-intensive work. As Raths and Lyman write (2003), “The challenge of making judgments about student teaching is akin to those facing a jury. There are rarely ever tight and precise definitions of what composes guilt or innocence in a jury trial. . . . however the process still calls for informed judgments” (p. 215).

Negotiating field placements and school partners

These informed judgments are not made by university-based teacher educators alone, but must be made in collaboration with our school partners. Teacher education programs are inextricably dependent upon field placements for student teachers. Yet the issues of control over the placements and communication with the placement often present challenges that can have a direct impact on teacher educators’ gatekeeping practices. It is a rare program that hand-picks cooperating teachers and makes individual matches between mentor teacher and student teacher. Although we could locate no large-scale studies that document student teaching placement practices, we do know that programs have a range of agreements with the field and a variety of administrative supports at the university level.

The majority of the programs in our sample reported little control, or even input, over the decisions about which cooperating teachers to use. Some of the programs have centralized, field placement services. Often, these offices have agreements with schools or school districts and it is personnel at the school end that either make the matches or develop the lists of classroom teachers. As one of our colleagues related, “We have lots of students in placements that are not ideal . . . we tried to maintain a list of teachers we didn’t want to use again, but they would re-appear on the lists.” (This experience was repeated by a number of faculty with whom we spoke.)

This lack of control of placements has implications for how much field-based information can be used by teacher educators to make gatekeeping decisions, and how much of a role the school-partners can and do play as gatekeepers. One faculty coordinator of a large program explained that, “school partners are not at the place where they truly see themselves as gatekeepers.” Another faculty member told of a case of a student from his social studies methods course who submitted a unit plan she had taught in an area high school. This professor assessed the unit plan as unacceptable, as the lessons did not maintain sufficient boundaries between church and state. However, the student teacher’s field evaluations were exemplary and the cooperating teacher rated the unit and the woman’s teaching most highly. Frustrated by the lack of influence on school-based curriculum planning, this faculty member characterized the lack of decision-making about placements and the weak link between field and campus as a “major program issue.” Other researchers (Knudsen & Turley, 2000) have explained some cooperating teachers’ reluctance to critique inadequate student teachers as a result of the close personal relationship that often develops. Cooperating teachers know more about the personal lives of the student teacher and might even make excuses for a student teacher’s lapses or lower their expectations.
Smaller programs or universities that use a Professional Development School (PDS) model, are often able to build strong communication systems, including faculty-school liaisons who develop long-term relationships with a small number of teachers or schools. In these situations, faculty report that cooperating teachers move from a less critical stance toward a more rigorous stance after working with the program for a few years. Clearly, the ongoing presence of faculty in the schools, and conferences about specific problem students, helps create a sense of shared gatekeeping responsibility among the school-based partners.

MONKEY IN THE MIDDLE OR PARTICIPATION IN THE ABSENCE OF CONTROL

Any random glance at the educational history of this country, especially over the past half century or so, reveals schools and teachers as lightening rods for all manner of social critique. Crime, economic instability, teenage pregnancy, loss of a global competitive edge, and so on, have been laid at the feet of schools and teachers who have been blamed wholesale for a host of societal failings and ills. Likewise, teacher educators and their university-based programs have become the sole scapegoat for all that is wrong with teachers and schools, with no acknowledgement of the vast enterprise that surrounds the preparation of teachers. There are many groups and constituencies engaged and invested in teacher preparation for reasons beyond ensuring quality teachers, including financial profit, political advancement, access to public and private funding, or personal notoriety. Thus, as teacher preparation has become highly politicized and political, it becomes more apparent that teacher quality is less a matter of competence versus incompetence, and more a fundamental battle for control in/of the gatekeeping process. Our examination in this chapter of the role of university-based teacher preparation in deciding who can or should teach illuminates the major dilemma facing teacher educators—they are held accountable for ensuring quality and blamed for teacher incompetence, but have little input in defining what quality means and minimal control over who enters and who is kept out of the profession. This lack of control is the consequence of a variety of factors and historical circumstances including teacher preparation as a collective enterprise, the place of teacher education in the academy, and the impact of the external socio-cultural context.

Teacher preparation as a collective enterprise

University-based teacher preparation is an enterprise that relies on the joint efforts of several different groups, some of whom are in the academy but sit outside the field, others of whom are in the field but are outside the academy. Thus teacher educators depend on arts and science colleagues, and school partners such as district administrators and teachers, to maintain their programs and enact their curricula. This alliance across these three groups is, and has historically been, uneasy, typically characterized by a lack of respect in the academy for education as an intellectual, or even a bona fide discipline, and mistrust of university-based educators on the part of school-based practitioners. Thus, teacher educators are placed in the unhappy position of working with reluctant or critical collaborators who may not always uphold the same goals or assume responsibility for quality teacher preparation, even while teacher preparation cannot occur without their participation.

Thus, several of the teacher educators we spoke with shared their frustration of having
almost no hand in the selection of student teaching placements and cooperating teachers, resulting in “lots of students in placements that are not ideal,” despite the reality that the field placement is a critical component of teacher preparation. Others described needing to rely on school partners such as principals or cooperating teachers for candid assessments of student teachers—particularly candidly critical assessments—in order to make a poor or failing grade “stick,” despite having little leverage to hold these partners accountable for student teacher quality. As one teacher educator stated, incompetence on the part of a student teacher will not necessarily affect certification in the absence of “a very vigilant supervisor, a teacher concerned about quality, [and] a principal who will back you up.”

Much of the discussion about teacher quality has emphasized subject matter preparation and teacher education has been criticized for devoting the majority of its programs to professional preparation over content knowledge. In reality, the opposite is true: historically, general education requirements or “academic” courses consume the majority of credits (as much as 75 percent) required for elementary or secondary teacher certification, and reform in university-based teacher preparation curricula over the past 50 years has consistently resulted in more academic courses and fewer education courses (Conant, 1964; Goodlad, 1990; Howey, 1983), and these academic courses are offered by arts and sciences faculty, not those in teacher education. Still, teacher educators continue to be faulted for new teachers’ lack of content knowledge, or their inability to pass subject matter tests, even while they are not directly responsible for candidates’ academic preparation, and have little authority over those who do.

The place of teacher education in the academy

The movement of teacher education from normal schools into the universities as a state-initiated reform resulted in an implicit agreement between teacher educators and states that has positioned teacher education as subordinate to the state for the past 100 years (Goodlad, 1990; Haberman, 1983; Melnick, 1996).

The state’s role in helping to establish teacher education departments in universities, became a legitimate license to exercise power and control over the curriculum in schools of education. . . . Once schools of education relied on the support of state education agencies for recognition and approval of their teacher education programs, they were compelled to accept the role and authority of the state in order to justify their own existence.

(Schneider, 1987, p. 215)

University-based teacher preparation programs cannot exist without state sponsorship and therefore are not always in a position to resist or question state mandates. Indeed, “no higher education specialty approaches teacher education in the degree of influence exerted by outside agencies, particularly state agencies controlling entry into public school teaching” (Goodlad, 1990, p. 93), an observation echoed, as we noted earlier, during different eras by numerous scholars. Ironically, it is the promise of certification that makes university-based programs marketable. By approving teacher education programs as conduits for teacher certification, states in essence protect or enhance program viability and attractiveness to students, yet teacher certification is an outcome that can only be granted by the state; teacher preparation programs do not control the certification process nor can they offer certification or deny it. They can, and do, offer or withhold their endorsement for certification, but the absence of their endorsement does not
necessarily keep low performing student teachers out of the classroom since graduates can still—often easily—achieve certification regardless via alternate routes, certification through testing, emergency licenses, etc. Even school districts are now in the business of certifying teachers, bypassing university-based teacher preparation altogether. Teacher educators find themselves caught in a paradox—over-regulation on the part of state agencies alongside vociferous calls for the de-regulation of teacher preparation (Cochran-Smith, 2001a).

It is not surprising then that our conversations found teacher educators to be the keepers of gates without locks. Thus, many of the faculty with whom we spoke characterized most of the gates through which students pass as “not rigorous,” not in terms of the robustness of individual assessments, but in terms of a gate’s ultimate capacity to keep students out of the profession or out of the teacher preparation program. Those gates that have the most teeth are those linked to state certification requirements—teaching test scores and indications of content knowledge, i.e. GPA, which measure concrete and discrete knowledge and skills. In all of the programs we canvassed, it was students not meeting minimum grade requirements or test scores who were most likely to be barred from entering—or exiting—the teacher preparation program.

Those gates that seemed to have very little teeth were invariably those conceptualized or developed by teacher educators themselves—disposition charts, teaching/INTASC standards, reflections on ethics and philosophy, observations and assessments of classroom performance. In fact, the majority of the programs with which we spoke include the assessment of candidates’ dispositions as a significant aspect of their teacher preparation and evaluation; in conversations with teacher education colleagues, all except one named dispositions such as flexibility, reflectivity, openness to learning, commitment to multiculturalism, as key qualities for student teachers to possess. Such skills, knowledge, and dispositions are often not easily quantifiable or discrete and do not lend themselves to standardized or mass assessment, yet they encompass professional knowledge and behaviors that teacher educators believe are essential to good teaching. Therefore, the gates built around this set of knowledge and skills must similarly be fluid and open-ended, offering students more than one opportunity to “get it” and offering teacher educators many different avenues for assessment. Thus, the designation of these gates as “lockless” is not meant to be pejorative but instead is an indication of a philosophical mindset that pervades teacher education and views teachers as advocates, and learning to teach as a developmental and complicated process. These gates do not, however, represent what the state and the public underscore as essential teacher knowledge, and therefore, do not necessarily lock individuals out of the teaching profession even while the teacher educators with whom we spoke do use them to keep applicants out of their programs and to stop students from continuing through to university endorsement for certification.

The impact of the external socio-cultural context

Teacher education is not, of course, immune to a changing socio-cultural context; no profession is. However, some of the changes have further affected, complicated or even eroded the level of control teacher educators exert as gatekeepers for teaching. First, as attested by our conversations with colleagues across the country, continued legislation to widen access to education has meant greater diversity among teacher candidates, more of whom exhibit complex and serious needs that must be accommodated if they are to grow into teachers. We certainly applaud ongoing efforts, both grass-roots and bureaucratic, that render schooling and professional study more inclusive. However, the question of
who can teach or who is ready to teach becomes even more difficult to address and requires teacher educators to balance ever more precariously their role as advocates with their responsibility as gatekeepers.

Teacher education programs have also been experiencing a period of growth in enrollments, beginning in the late 1980s. However, despite dramatic increases in enrollments, most teacher education programs have not yet recovered from the severe budget cuts that accompanied the teacher surplus of the 1970s. Teacher education programs continue to be under-resourced and rely heavily on adjuncts, doctoral students, and non-tenure-line faculty to operate even while they are pressured by university administrators to admit additional students given their continued ability to attract applicants. Several faculty with whom we spoke invoked the image of teacher education as “cash cow,” either in direct statements, or by implication when they talked about “pressure to keep enrollments high” or “not turning [applicants] away.” Pressure to admit students means that admissions criteria may or may not be applied to keep out candidates of questionable quality, yet once in the program, teacher educators are held accountable for ensuring that these very same candidates achieve minimum standards. This pressure may also, in part, represent a reaction to for-profit or alternative teacher certification routes that threaten to pull potential students away from university-based teacher preparation.

Finally, in a social environment characterized by consumerism, teacher educators’ ability to gatekeep with conviction may be thwarted by students (and their representatives) advocating for themselves, rejecting professional assessments, or threatening litigation. As discussed earlier, almost all of our colleagues spoke of parents becoming “heavily involved” in difficult decisions surrounding students’ apparent lack of fitness for teaching, of students resisting intervention options, or of needing the advice of legal counsel before making a decision to discontinue a student or take a particular action.

WHAT NEXT?

According to Cochran-Smith and Fries, researchers on teacher education have “worked from quite different constructions of the problem” and “that simply asking a different question about the quality and depth of the research base on teacher education can produce a different answer” (2005, p. 99). This chapter offers a perspective on and analysis of learning to teach that suggest there are some different questions we as teacher educators can ask that may expand our research agenda to allow the possibility of alternate explanations for and definitions of teacher quality. The questions we posed at the beginning of our discussion bear repeating. What indicators of teacher quality do teacher educators look for as they engage in the daily work of teacher preparation? What kinds of gatekeeping mechanisms are in place in teacher education programs—at entry, during coursework, during fieldwork and at completion—to ensure teachers of quality are selected and then certified? Do certain characteristics beyond GPA, test scores and race (including, for instance, academic difficulties, disabilities, mental health, standard English language proficiency) or dispositions (such as commitment to diversity, openness to learning and change, an ethical stance, etc.) figure into whether a teacher candidate is ready to—or can—teach?

Research on teacher education over the past 50 years has focused on teacher education as a training problem, a learning problem, and a policy problem (Cochran-Smith & Fries, 2005). The intersection of these three research strands, gatekeeping in teacher education, and the questions we pose above allow us to make specific recommendations about future empirical work. Teacher education as a training problem emphasizes
“transportable training procedures that [have] an impact on teacher behaviors” (Cochran-Smith & Fries, 2005, p. 16). Thus, gatekeeping in teacher education as a training problem points to the need to document and examine the practices, interventions, and programmatic structures embedded in teacher preparation programs that serve as major assessment points and mechanisms throughout the learning-to-teach process. We need to know what kinds of strategies teacher educators use—and when—and how these strategies, interventions and gates impact, support or impede teacher learning and teacher success. We also need to know what works and what does not and under what circumstances—what kinds of gates should be in place in teacher education programs so as to ensure teacher quality.

Teacher education as a learning problem looks at how teachers acquire the “knowledge, skills and dispositions needed to teach, and how they [interpret] their experiences in teacher preparation courses” (Cochran-Smith & Fries, 2005, p. 29). When gatekeeping is inserted as a variable, teacher education as a learning problem must ask how teacher educators measure, recognize, and remediate student teacher learning and quality, and what factors teacher educators weigh as they ultimately decide who is fit or ready to teach. Some of these factors may involve student teacher characteristics and dispositions that have received very little attention from the research community. Yet teacher educators would argue that dispositions play an important role in fitness to teach, while certain characteristics that student teachers present require supports and accommodations that are difficult to provide and also raise ethical dilemmas because the rights of students must be balanced against the rights of teachers who are also students.

Finally, teacher education as a policy problem aims to “provide evidence about how teacher education as an overall enterprise can be successful and cost effective” (Cochran-Smith & Fries, 2005, p. 47). Studying gatekeeping practices in teacher education could provide much data about the supports, decisions, policies, and interventions that need to be (or are) in place during the learning-to-teach process that likely enhance success in teacher education. It follows that effective gatekeeping practices increase cost effectiveness because resources and time are targeted to specific student teacher needs, and decisions regarding appropriateness and fit are embedded into programs and are made deliberately and consistently—another lens through which to examine teacher education. Gatekeeping in teacher education as a policy problem also suggests that we need to study assessment and accountability policies across institutions in order to understand how gatekeeping policies support the work of teacher educators, make explicit definitions of teacher quality, and keep weak teacher candidates out of the profession. Given the current push for evidence-based judgments, such studies should also focus on gathering data that illuminates whether gatekeeping policies currently in place in teacher education programs actually ensure teaching readiness on the part of graduates in their initial years of practice.

Our recommendations are not intended to be comprehensive or exhaustive. Rather, we offer them as a way to highlight how little we know about what goes on in teacher education programs or what teacher educators do in their daily work with student teachers, how notions of teacher quality, fitness, and readiness are fluid, contingent and program-specific even while there appears to be more in common across programs and practices than is acknowledged or recognized, and how the current policy debate about quality teachers focuses on the big picture of state standards, teacher tests, and subject matter knowledge, but attends minimally to the space between entry into teacher preparation and exit into the profession, where teacher candidates are actually engaged in the process of becoming teachers.
NOTE

1 “Cooperating teacher” (CT) is the term we use throughout this paper; we realize the terms “mentor teacher” and “associate teacher” are often used, and that these terms convey subtle differences of program philosophy.

APPENDIX 1

Gatekeeping in teacher education

Conversations protocol

Approximate number of students your institution admits each year to teacher preparation programs:

Approximate number of teachers your institution certifies each year:

Who makes admissions decisions (for teacher preparation programs)?

Who makes student teaching placement decisions—selection and assignment?

1 Requirements and process for entrance in the elementary teacher preparation program

- What are the minimum requirements for acceptance into your program (e.g. GPA, GRE/SATs, other test scores, experience with children, experience in urban settings, strong writing, dispositions, certain/prerequisite coursework, faculty recommendation, other)?
- If there are any special steps involved in the acceptance process (interview, entrance portfolio, group exercise, etc.), what are they?
- If you had to say the two most important qualities/characteristics/dispositions, and/or experiences, you look for in prospective teachers, what would these be?

2 Gatekeeping as students progress through the elementary teacher preparation program

- What are the gates (assessments that determine continuation in the program)?
- Have there been students who did not continue in the program and/or were not recommended for certification? At what points/stages in the program were they asked/did they choose not to continue?
- Have there been students who did complete the program and were recommended for certification, but required special support/intervention/extra time in order to be successful? What did these interventions entail? (List.)

3 Problems, dilemmas, and challenges

- What types of problems/dilemmas/challenges have you dealt with in the past few years related to candidates readiness to teach? (List.)

4.1 Meeting the highly qualified teachers challenge

The secretary’s annual report on teacher quality

U.S. Department of Education
Rod Paige
Secretary
2002 Executive Summary

THE TITLE II REPORTING SYSTEM

Under the 1998 reauthorization of Title II of the Higher Education Act, the secretary of education is required to issue annual reports to Congress on the state of teacher quality nationwide. Meeting the Highly Qualified Teachers Challenge is the inaugural report on this important issue. The 1998 reauthorization also established a reporting system for states and institutions of higher education to collect information on the quality of their teacher training programs. Data collected under the Title II reporting system are available at www.title2.org and include information on state teacher certification requirements, the performance of prospective teachers on state licensure tests and the number of teachers hired on temporary or emergency certificates.

THE VITAL ROLE OF TEACHERS IN LEAVING NO CHILD BEHIND

As President Bush said recently, “We give our teachers a great responsibility: to shape the minds and hopes of our children. We owe them our thanks and our praise and our support.” Because of the vital role that teachers play in the lives of our children, the No Child Left Behind Act requires that all teachers in core academic subjects be highly qualified by the end of the 2005–2006 school year.

As part of the new law, Congress defines highly qualified teachers as those who not only possess full state certification but also have solid content knowledge of the subjects they teach. For example, beginning Fall 2002, all new elementary school teachers will have to pass tests in subject knowledge and teaching skills in math, reading, and writing, while new middle and high school teachers must pass rigorous subject-matter tests or have the equivalent of an undergraduate major, graduate degree or advanced certification in their respective fields. As this report details, research suggests teachers with strong academic backgrounds in their subjects are more likely to boost student performance.

The Title II reporting system reveals that states have a long way to go in meeting these requirements, largely because of states’ outdated certification systems. Many academically accomplished college graduates and mid-career professionals with strong subject matter
backgrounds are often dissuaded from entering teaching because the entry requirements are so rigid. At the same time, too many individuals earn certification even though their own content knowledge is weak. States’ systems seem to maintain low standards and high barriers at the same time.

A BROKEN SYSTEM

The data collected for this report suggest that schools of education and formal teacher training programs are failing to produce the types of highly qualified teachers that the No Child Left Behind Act demands. Some highlights from the Title II reporting system:

- Only 23 states to date have implemented teacher standards tied to their respective academic content standards for grades K-12.
- Academic standards for teachers are low. On one popular teacher licensure test used by 29 states, only one state set its passing score near the national average in reading, while 15 set their respective passing scores below the 25th percentile. On math and writing tests, only one state set its passing score above the national average. Not surprisingly, more than 90 percent of teachers pass these tests.
- Forty-five states have developed alternative routes into the profession to bypass some of the burdensome requirements of the traditional system. While performance on licensure tests is higher among alternative route teachers than traditionally prepared teachers in most states, alternative routes are still larded with a variety of requirements.
- States are increasingly relying on teachers who are hired on waivers and lack full certification (a practice that is to be phased out under the new law). Nationwide, 6 percent of teachers lack full certification, but the share of uncertified teachers is higher in high-poverty schools and certain fields like special education, math and science.

ENSURING A HIGH QUALITY TEACHER IN EVERY CLASSROOM

Data collected for this report, and outside sources, confirm that states have a long way to go in aligning their certification regimes with the requirements of the No Child Left Behind Act. In order to comply with the new law, states and universities may well have to transform their preparation and certification systems, by basing their programs on rigorous academic content, eliminating cumbersome requirements not based on scientific evidence and doing more to attract highly qualified candidates from a variety of fields.

Across the country, there are several promising experiments that recruit highly qualified candidates who are interested in teaching but did not attend schools of education and place them quickly into high-need schools, providing training, support and mentoring. If states are to meet the requirements of the No Child Left Behind Act these programs should become models for the future, as states make it less burdensome for exceptional candidates to find teaching positions in our nation’s schools.

In order to leave no child behind, we need a highly qualified teacher in every classroom. Clearly, states and universities have much work to do in the years ahead. This report points the way.
INTRODUCTION

Background on the secretary’s report

Few adults are as important in the lives of children as teachers are. Ensuring that all students have access to highly qualified teachers is of paramount importance, especially for disadvantaged children. Filling the promise of leaving no child behind rests on our ability to staff our schools with the best teachers our nation can produce.

Recognizing the vital role that teachers play: Congress recently required the secretary of education to issue an annual report on the state of teacher quality and teacher preparation in the 50 states. This is the first full report submitted to Congress on these topics.

This report contains a variety of data collected under the requirements of Title II of the Higher Education Act. Last amended in 1998, Title II requires three annual reports on teacher preparation. First, institutions of higher education are to report various data to states. These data include the pass rates on state certification and licensure examinations of students completing their teacher-training programs.

Second, using reports from institutions of higher education as well as other sources, states are to report the following information to the U.S. Department of Education:

- state certification and licensure requirements for completers of traditional and alternative teacher preparation programs;
- statewide pass rates on the most recent state assessments of graduates of teacher preparation programs, pass rates disaggregated by institution, and quartile rankings of their institutions based on their pass rates;
- the number of teachers on waivers or emergency and temporary permits;
- information on teacher standards and their alignment with student standards; and
- criteria for identifying low-performing schools of education.

Finally, the secretary of education is to report to Congress on national patterns and their implications (the topics of this document and related material found at www.title2.org).

Outline of the secretary’s report

This report attempts to do more than present the key findings from the Title II reporting system. It also seeks to place these findings within the context of state and federal policy and rigorous scientific research. Here is a brief overview:

Chapter 1: “The Quest for Highly Qualified Teachers.” This chapter will provide a summary of the sweeping reforms enacted by the No Child Left Behind Act, especially the new requirement that all teachers be “highly qualified” by 2005–2006. It also draws upon solid research to answer the question: What do we know about highly qualified teachers?

Chapter 2: “Preparing and Certifying Highly Qualified Teachers: Today’s Broken System and Its Alternative.” Chapter 2 investigates how teacher recruitment, preparation and certification systems in place today impede the development of highly qualified teachers and presents a more promising model for the future.

Chapter 3: “Are States Doing Enough to Produce Highly Qualified Teachers? Lessons from the Title II Reporting System.” Chapter 3 presents findings from the Title II reporting system, as well as rigorous evidence from other sources, about the “state of the states” vis-à-vis the preparation and certification of highly qualified teachers.

Chapter 4: “Looking Forward: A Highly Qualified Teacher in Every Classroom.” The concluding chapter presents some final insights into the state of teacher quality today and offers suggestions
for states as they seek to meet the requirements of the No Child Left Behind Act to provide a highly qualified teacher in every classroom.

CHAPTER 1: THE QUEST FOR HIGHLY QUALIFIED TEACHERS

The No Child Left Behind Act is the most fundamental transformation of federal education policy in at least 35 years. Upon its signing, President George W. Bush said: “Today begins a new era, a new time in public education in our country. As of this hour, America’s schools will be on a new path of reform and a new path of results.” Congress signaled its support by passing the law by an overwhelming bipartisan majority.

The No Child Left Behind Act brings new thinking and new resources to the challenge of educating all of the nation’s children. Many of the new ideas and new funds are directed at the issue of improving teacher quality. Here is a snapshot of some of the most important initiatives in this area:

**Teacher quality state grants:** under the new law, states and school districts will be eligible for almost $3 billion in flexible grants to improve the quality of teachers and principals using research-based strategies. In return, districts must demonstrate annual progress in ensuring that all teachers teaching in core academic subjects are highly qualified.

**Reading first:** this major new initiative is aimed at helping every student become a successful reader by the end of third grade. The president has requested $1 billion for this program in 2003. Most of these funds will support professional development in research-based reading instruction.

**Troops to teachers and transition to teaching:** both programs seek to streamline the entry of talented mid-career professionals into the classroom through alternate routes to certification.

Other formula-based programs will also provide substantial resources for professional development, including Title I ($11.4 billion proposed for 2003), Educational Technology State Grants ($700 million) and the English Language Acquisition State Grants ($665 million). Access to information about all U.S. Department of Education teacher quality grants is available through a searchable database at [http://www.ed.gov/offices/OESE/TPR/index.html](http://www.ed.gov/offices/OESE/TPR/index.html).

In addition, the president’s budget for 2003 calls for a major expansion of loan forgiveness for teachers serving in high-poverty schools, from the current maximum of $5,000 to a maximum of $17,500.

**Demanding highly qualified teachers**

These bold initiatives represent the federal government’s serious commitment to improving teacher quality. But perhaps the most dramatic policy shift in No Child Left Behind is the new requirement that all teachers of core academic subjects be “highly qualified.” What are the consequences of this new requirement? For school districts receiving Title I funds, the consequences are dramatic and immediate. Starting in the coming school year—that is, Fall 2002—Title I funds may not be used to hire new teachers in targeted assistance Title I programs who do not meet the definition of “highly qualified.” Though final regulations are forthcoming, the Department has indicated that Title I schools using a schoolwide approach may not hire any new teachers to teach in the core academic areas who are not highly qualified. Schools using a pullout approach may not use their Title I funds to support teachers who do not meet the definition of “highly qualified.” School districts that are out of compliance could lose their Title I dollars.

Non-Title I schools will be affected as well. States must ensure that by the end of the 2005–2006 school year, all teachers teaching in core academic subjects must be highly qualified. In addition, states must ensure that districts make annual progress toward that end.

With such large consequences at stake, understanding the definition of “highly qualified”
The term “highly qualified”—
(A) when used with respect to any public elementary school or secondary school teacher teaching in a State, means that—
   (i) the teacher has obtained full State certification as a teacher (including certification obtained through alternative routes to certification) or passed the State teacher licensing examination, and holds a license to teach in such State, except that when used with respect to any teacher teaching in a public charter school, the term means that the teacher meets the requirements set forth in the State’s public charter school law; and
   (ii) the teacher has not had certification or licensure requirements waived on an emergency, temporary, or provisional basis;
Therefore, except for charter school teachers, all teachers of core academic subjects must have full state certification or licensure to be considered “highly qualified.” But new teachers of core academic subjects face even stricter requirements:

[The term “highly qualified”——]

(B) when used with respect to—
   (i) an elementary school teacher who is new to the profession, means that the teacher—
      (I) holds at least a bachelor’s degree; and
      (II) has demonstrated, by passing a rigorous State test, subject knowledge and teaching skills in reading, writing, mathematics, and other areas of the basic elementary school curriculum (which may consist of passing a State-required certification or licensing test or tests in reading, writing, mathematics, and other areas of the basic elementary school curriculum); or
   (ii) a middle or secondary school teacher who is new to the profession, means that the teacher holds at least a bachelor’s degree and has demonstrated a high level of competency in each of the academic subjects in which the teacher teaches by—
      (I) passing a rigorous State academic subject test in each of the academic subjects in which the teacher teaches (which may consist of a passing level of performance on a State-required certification or licensing test or tests in each of the academic subjects in which the teacher teaches); or
      (II) successful completion, in each of the academic subjects in which the teacher teaches, of an academic major, a graduate degree, coursework equivalent to an undergraduate academic major, or advanced certification or credentialing;
Notice that these additional requirements focus entirely on rigorous subject matter preparation, demonstrated either through adequate performance on a test or through successful completion of a major, graduate degree, or advanced credentialing. Next, the law provides further detail on the definition of “highly qualified” as it applies to existing teachers of core academic subjects:

[The term “highly qualified”——]

(C) when used with respect to an elementary, middle, or secondary school teacher who is not new to the profession, means that the teacher holds at least a bachelor’s degree and—
   (i) has met the applicable standard in clause (i) or (ii) of subparagraph (B), which includes an option for a test; or
   (ii) demonstrates competence in all the academic subjects in which the teacher teaches based on a high objective uniform State standard of evaluation that—
      (I) is set by the State for both grade appropriate academic subject matter knowledge and teaching skills;
(II) is aligned with challenging State academic content and student academic achievement standards and developed in consultation with core content specialists, teachers, principals, and school administrators;

(III) provides objective, coherent information about the teacher’s attainment of core content knowledge in the academic subjects in which a teacher teaches;

(IV) is applied uniformly to all teachers in the same academic subject and the same grade level throughout the State;

(V) takes into consideration, but not be based primarily on, the time the teacher has been teaching in the academic subject;

(VI) is made available to the public upon request; and

(VII) may involve multiple, objective measures of teacher competency.

Again, the focus of the law is on “content knowledge.” Congress has made it clear that it considers content knowledge to be of paramount importance. The law also implies, through these detailed definitions, that Congress suspects that current state certification systems are not doing enough to ensure preparation in solid content knowledge—otherwise the definition could have ended after subparagraph (A). As we will learn, from both research and the Title II data, these concerns are well founded.

**What we know about highly qualified teachers**

By adding strict new mandates about “highly qualified” teachers, Congress indicated the importance of teacher quality in improving the nation’s schools. By focusing its definition of “highly qualified” teachers on preparation in content knowledge, as opposed to components such as pedagogy or teaching practicums, it expressed its opinion of what matters most. Is teacher quality an important indicator of school success? Does content knowledge relate to academic achievement? Aren’t other things, like methods courses or practice teaching, essential as well? Let us turn to the scientific evidence for guidance.

**Evidence that good teachers matter**

For many years, research has found teacher quality to be a key determinant of student success. Large-scale studies suggest that teacher quality is more closely related to student achievement than other factors, such as class size, spending and instructional materials. As part of his landmark 1966 study, *Equality of Educational Opportunity*, sociologist James Coleman noted that among African American students, there was a correlation between student achievement and teachers’ scores on vocabulary tests. Among students generally, however, Coleman found no discernable pattern.

But Coleman’s evaluation was aggregated at the school level, meaning important variations among individual teachers and classrooms within the same school were not measured. In recent years, a new approach to measuring teacher quality has been developed, focusing on the value that teachers provide to individual students in their classrooms. By testing students annually and comparing the growth of individual students and individual classrooms, researchers can pinpoint the effect teachers are having on their students. Because the analysis is focused on learning gains, and not absolute test scores, the influence of background characteristics like socioeconomic status can be parsed out. Not surprisingly, researchers have found that some teachers are much more effective than others.

Value-added measures also permit researchers to examine the cumulative effects a string of high-quality versus low-quality teachers can have on student performance over several years. Some of the best research on this subject has been done by statistician William Sanders in
Tennessee. The state of Tennessee evaluates all of its teachers based on the learning gains individual students make while in their respective classrooms. Using this information, Sanders categorized the state’s teachers into quintiles based on the performance of their students. As part of his research, he tracked two comparable sets of third-graders: one group which had three successive teachers from the top quintile, and the other that had three successive teachers from the bottom quintile. By the end of fifth grade, the set with the least effective teachers posted academic achievement gains of 29 percent, compared to gains of 83 percent by the set assigned to the most effective teachers—a gap of more than 50 percent. Moreover, Sanders found that the effect was both additive and cumulative, denying students the full opportunities they might have had to acquire an excellent education.

Similar studies in Boston and Dallas have confirmed these findings. According to some estimates, the difference in annual achievement growth between having a good teacher and having a bad teacher can be more than one grade level of achievement in academic performance. The implication is that not only does teacher quality matter—it matters a lot. Students unfortunate enough to face several bad teachers in a row face devastating odds against success.

Evidence of the importance of verbal ability and content knowledge

Ever since the publication of the Coleman report, studies have consistently documented the important connection between a teacher’s verbal and cognitive abilities and student achievement. Teachers’ verbal ability appears to be especially important at the elementary level, perhaps because this is when children typically learn to read. Stanford University economist Eric Hanushek, who has conducted extensive academic literature reviews on teacher quality, said, “[P]erhaps the closest thing to a consistent conclusion across studies is the finding that teachers who perform well on verbal ability tests do better in the classroom [in boosting student achievement].”

More recent studies suggest that subject-matter background can also have a positive effect on student performance. Research has generally shown that high school math and science teachers who have a major in the subjects they teach elicit greater gains from their students than out-of-field teachers, controlling for student’s prior academic achievement and socioeconomic status. These same studies also suggest that possessing an undergraduate major in math and science has a greater positive effect on student performance than certification in those subjects. Research has not always produced consistent results on the effects of teachers having a masters degree, but in the better designed studies the effects are weak, at best.

Yet even as research demonstrates the importance of content knowledge, new data from the National Center for Education Statistics (NCES) suggests that too many students, especially in the middle-school grades, have teachers who are not fully qualified in their subject areas. For example, in 1999–2000, 15 to 22 percent of middle-grade students in English, math and science had teachers who lacked a postsecondary major, minor or certification in the subject taught. In biology and life science, physical science and English as a Second Language (ESL) or bilingual education classes, the data are even more troubling. Between 30 and 40 percent of middle-grade students had teachers who lacked a major, minor or certification in these subjects.

The evidence on pedagogy and education degrees

This report shows that verbal ability and content knowledge of teachers have been linked to higher student achievement, but what about other attributes, like knowledge of pedagogy, degrees in education, or amount of time spent practice teaching? After all, these are the requirements that make up the bulk of current teacher certification regimes.
There is a great deal of contention surrounding the evidence on these components, with some studies linking these requirements to improved student achievement. However, the quality of many of these studies has been called into question. A report by the Abell Foundation evaluated approximately 175 studies spanning the past 50 years, all of which purported to demonstrate a connection between certification and improved student outcomes. The analysis found that virtually all of these evaluations were not scientifically rigorous, did not use generally accepted statistical techniques to gather data and relied too much on anecdotal evidence.

Scientific evidence also raises questions about the value of attendance in schools of education. In a recent study, economists Dan Goldhaber and Dominic Brewer found that while certified math and science teachers outperformed those who lack certification (as measured by their students’ achievement), there was no statistical difference in performance between teachers who attended conventional training programs and received traditional teaching licenses versus those who did not complete such programs and were teaching on emergency or temporary certificates.

Conclusion: the challenge of highly qualified teachers

As this chapter made clear, the federal government is serious about raising the quality of the nation’s teaching force. And because the best available research shows that solid verbal ability and content knowledge are what matters most, it is clear that Congress wrote its definition of “highly qualified teachers” wisely.

What are the implications of this new law for state policy? How can states design preparation and certification systems that produce enough highly qualified teachers for every classroom? These and other questions will be answered in Chapter 2.
4.2 Assessment of diversity in America’s teaching force

A call to action

Presented by the National Collaborative on Diversity in the Teaching Force

INTRODUCTION

In late 2001, Congress passed the reauthorization of the Elementary and Secondary Education Act (ESEA), also known as the No Child Left Behind Act (NCLB). The goal of this legislation is to improve the academic performance of all students, while simultaneously closing achievement gaps that persist between students from different ethnic groups and economic backgrounds. The law includes a number of elements considered essential for reaching this goal, including ensuring that all teachers are “highly qualified.” Yet, despite this focus on teacher quality, little attention has been paid to the issues of cultural competence and diversity in the teacher workforce—critical factors in improving the performance of students of color.

To examine the relationships among educational opportunity, educational achievement, educator diversity, and teacher quality, more than 20 of the nation’s leading education and advocacy organizations came together in November 2001 for a three-day conference entitled “Losing Ground: A National Summit on Diversity in the Teaching Force.”

Focusing specifically on the roles ethnicity and cultural competence play in student achievement, participants reviewed research on the impact of culturally responsive pedagogy on children. They also studied demographic data on the growing diversity of America’s schoolchildren and the static composition of the teaching force. After this review, participants voiced widespread concern about these demographic disparities and their negative impact on the quality of education for all children. In addition, participants noted that although teacher quality has been accepted and internalized as a mantra for school reform, the imperative for diversity is often marginalized rather than accepted as central to the quality equation in teaching.

As a result, the participating organizations agreed on the need to create the National Collaborative on Diversity in the Teaching Force (the Collaborative). The Collaborative’s primary mission is to infuse the issues of teacher diversity and cultural competence into the education policy debate, at both state and national levels, with the same vigor and frequency as the issue of teacher quality.

Since the 2001 Summit, partner organizations have worked to achieve that mission. While the organizations vary in size, years of existence, number of staff, geographical location, and budget, they are committed to the following goals:

- coalescing and increasing the research base on culturally responsive teaching;
- identifying and eliminating obstacles to expanding the pool of prospective teachers of color and to increasing the cultural competence of all teachers;
insisting that resources needed for successful teaching be equitable, no matter what school the teachers work in; and
demanding that significantly greater resources be targeted to the recruitment, preparation, and support of a teaching cadre that is fully qualified, ethnically diverse, and culturally competent.

However, as controversies continue to swirl around NCLB and achievement gaps continue to widen in too many communities, the Collaborative is more concerned than ever that the issues of diversity and cultural competence in the teaching force have not received the attention they deserve from policymakers.

Recognizing the dearth of meaningful research on the number and impact of teachers of color, as well as on state efforts to recruit and retain teachers of color, the Collaborative commissioned three significant reports (These reports are available online at the primary partners web sites):

- *The Presence and Performance of Teachers of Color in the Profession* (Gay et al., 2003)

These reports, along with the expertise and vision of the members of the Collaborative, form the foundation of this assessment, which is organized into the following sections:

I The Current State of Diversity and Cultural Competence in the Classroom briefly addressed the representation of teachers of color in the teaching force and their impact on student achievement.

II The Future of Diversity in Public School Classrooms looks at efforts taken by states to recruit a diverse teaching force, trends in test scores for teacher candidates of color, and the implications of NCLB.

III Conclusion and Implications for Research and Policymakers summarizes the beliefs of the Collaborative and provides a list of recommendations for increasing the percentages of teachers of color in the workforce.

IV The appendices include a list of 2001 Summit participants and a list of the Collaborative’s primary partners.

Taken together, these findings present an important first step toward creating a truly qualified, diverse teacher workforce that meets the needs and potential of all public school students. Additional research is needed, but time is passing quickly, and action is vital. We cannot continue to wait as more children of color fail to reach their potential and as fewer teachers of color join and remain in the education community.
I THE CURRENT STATE OF DIVERSITY AND CULTURAL COMPETENCE IN THE CLASSROOM

The challenges of ensuring teacher excellence and diversity are not new. However, only recently have these issues begun to garner the public attention needed to bring about actual change in the composition of the teacher workforce.

Representation of teachers of color in the workforce

According to the National Center for Education Statistics (NCES, 2003), the number of minority teachers (teachers of color) nationwide is not representative of the number of minority students (students of color). For example,

- In 2001–2002, data shows that 60 percent of public school students were White, 17 percent Black, 17 percent Hispanic, 4 percent Asian/Pacific Islander, and 1 percent American Indian/Alaska Native.
- In contrast, 2001 data shows that 90 percent of public school teachers were White, 6 percent Black, and fewer than 5 percent of other races.
- Some 40 percent of schools had no teachers of color on staff.

Digging beneath the surface of the data (NCES, 2003), further trends emerge.

- The percentage of teachers of color does not even approximate the percentage of students of color in any state with a sizable population of diverse residents except Hawaii. The District of Columbia also is an exception.
- Across the states, the larger the percentage of students of color is, the greater the disparity with the percentage of teachers of color. Ironically, these are the areas with the greatest need for teachers of color.
- Teachers of color come closest to having proportional representation in large, urban school districts.
- Most teachers of color are employed in schools that have 30 percent or more students of color. For American Indians/Alaska Natives, these schools are located in rural areas and small towns, rather than urban centers.
- Teachers of color tend to teach in schools that have large numbers of students from their own ethnic groups.
- Teachers of color are found in states and regions of the United States with large percentages of their own ethnic groups. Thus, the highest percentages of African American teachers are found in the Southeast, Latinos in the West and in the Northeast, American Indians/Alaska Natives in the central and western regions, and Asian Americans in the West. Attendance at colleges and schools of education follow similar patterns.
- Teachers of color largely are geographically isolated from each other and from their White colleagues, in terms of both where they enroll in teacher education programs and where they are employed.
- Within ethnic groups, teachers of color are about equally represented in elementary and secondary schools.

Furthermore, statistical projections show that while the percentage of students of color in public schools is expected to increase, the percentage of teachers of color is not expected to rise—unless action is taken on the state and national levels.
The impact of teachers of color on student achievement

Policymakers, teacher educators, members of ethnic communities, and school leaders agree that the education profession needs more teachers of color. More teachers of color would

- increase the number of role models for students of color;
- provide opportunities for all students to learn about ethnic, racial, and cultural diversity;
- be able to enrich diverse students’ learning because of shared racial, ethnic, and cultural identities; and
- serve as cultural brokers, able not only to help students navigate their school environment and culture, but also to increase the involvement of other teachers and their students’ parents.

Although their contributions are sometimes identified as having more of an impact on the social and relational areas than on academic performance, increasing the percentage of teachers of color in the workforce is connected directly to closing the achievement gap of students.

Most of the data currently available on connections between teachers of color and student performance are generated from small-scale qualitative research involving single or multiple case studies. These data focus on a number of significant, though under-recognized, school achievement markers, including attendance records, disciplinary referrals, dropout rates, overall satisfaction with school, self-concepts, cultural competence, and students’ sense of the relevance of school.

While additional data about the positive impact of teachers of color on student achievement need to be gathered, the limited number of studies indicate that

- Students of color tend to have higher academic, personal, and social performance when taught by teachers from their own ethnic groups. (However, this finding does not suggest that culturally competent teachers could not achieve similar gains with students of color from different ethnic groups.)
- Teachers from different ethnic groups have demonstrated that when students of color are taught with culturally responsive techniques and with content-specific approaches usually reserved for the gifted and talented, their academic performance improves significantly.
- Teachers of color have higher performance expectations for students of color from their own ethnic group.

II THE FUTURE OF DIVERSITY IN PUBLIC SCHOOL CLASSROOMS

Efforts by states to recruit and retain teachers of color

States across the country are recognizing the urgent need to recruit and retain teachers of color and are implementing a variety of programs and policies that complement traditional teacher recruitment methods. Some of these approaches include the following:

- Alternative programs, in which teacher candidates are appointed as the teacher-of-record in a classroom after initial training of six months or less. These alternatively trained teachers tend to complete their preparation program while employed as teachers.
- Early outreach/precollegiate programs, which are designed to expose middle and high school students to teaching as a profession.
- Community college outreach programs, which steer teacher candidates toward completion of an associate’s and then a bachelor’s degree. Community colleges have proven to be a
highly effective resource for preparing new teachers—approximately 20 percent of the current teacher workforce began their education in community colleges.

- Paraeducator (often referred to as paraprofessionals or teachers’ aides) outreach programs, which target and recruit paraeducators to become fully licensed teachers. In some states, these programs are called “career ladder” approaches.
- Scholarships, grants, and fellowships, which provide financial incentives and are among the most popular strategies to recruit teachers.
- Loans and loan forgiveness programs, which are offered by several states to help prospective teachers defray the cost of their education.

### Testing among teacher candidates of color

Most states and schools of education require some form of standardized testing for entry into teacher education programs. As an exit criterion, a large number of states also require standardized testing of teacher candidates to assess their knowledge in subject matter areas that must be passed in order to become a licensed teacher. The majority of states use the Praxis series created by the Educational Testing Service—Praxis I is a basic skills test used for entry into teacher education programs and Praxis II is designed to assess the knowledge of beginning teachers in a specific subject or content area. It is important to understand that passing scores alone do not guarantee teachers will be highly effective, nor does failing the tests automatically mean teachers will be ineffective. However, the tests do assess what a beginning teacher should know.

Limited data are available on the testing results of teachers of color, partly because the national pool of teachers—both in the classroom and in the pipeline—contains far fewer teachers of color than teachers who are not of color. However, the data does reveal specific trends:

- In most instances, fewer than 50 percent of African Americans pass teacher tests. This pattern prevails across time, location, and types of tests.
- Overall, more teacher candidates of color pass Praxis II subject matter content tests than Praxis I basic skills tests. The pass rates on Praxis II are greater for secondary than for elementary teachers.
- All teacher candidates of color (African Americans, Asian Americans, Latino Americans, and American Indians/Alaska Natives) who passed both Praxis I and II scored much higher on the SAT than their ethnic group peers who did not pass. They also scored higher on the SAT than those in the general population who took Praxis I and II.
- There are positive correlations between SAT and ACT scores, grade point averages, and performance on teacher tests for all ethnic groups.
- Teacher candidates of color who took the SAT tend to perform better on the Praxis I certification tests than those who took the ACT college entrance examination. The reverse is true for Praxis II for all ethnic groups, except African Americans.

Clearly, much more research is needed on the impact of practices that may facilitate or obstruct the entry of teachers of color into the profession. Additional research is needed to find out why these disparities exist and what the best solutions are to closing this gap. The Collaborative is firmly committed to identifying and decreasing the obstacles that currently impede efforts to expand the pool of prospective teachers of color.

### The implications of No Child Left Behind legislation

Since the No Child Left Behind legislation was passed in 2001, several substantive changes have been made, and additional revisions no doubt will take place in the coming years. Members of
this Collaborative support the legislation’s goals of improving student performance and closing achievement gaps. They particularly are interested in the timely, adequate provision of resources necessary for improving student achievement.

However, one of the resources necessary for improving the performance of students of color is a teacher workforce that is culturally competent and diverse. Even though the legislation calls for “highly qualified” teachers and leaves the actual implementation and assessment to each state, the logistics of this complex legislation continue to create significant barriers to recruiting teachers of color. The Collaborative is concerned about the long-term implications of this legislation if future revisions do not remove these barriers and clearly spell out cultural competence and diversity as critical elements of a highly-qualified teacher workforce.

III CONCLUSION AND IMPLICATIONS FOR RESEARCH AND POLICYMAKERS

The Collaborative believes that:

- Diversity and cultural competence are key factors in improving the quality of America’s teaching force.
- The issues of teacher diversity and cultural competence must be infused into state and national education policy agendas.
- Teachers of color and culturally competent teachers must be actively recruited and supported.
- Barriers for candidates of color across the teacher development continuum must be identified and reduced.
- Institutional resources to meet the growing need for teachers of color must be increased.
- Toxic institutional and program practices—including institutional and individual racism—in schools and colleges must be eliminated.
- Highly qualified teachers must be equitably distributed to ensure that students in high-poverty and high-minority schools receive their fair share of the best and experienced teachers.

To do this, significantly greater resources need to be targeted to the recruitment, preparation, and support of a teaching cadre that is fully qualified, ethnically diverse, and culturally competent. Although the members of the Collaborative recognize that there is no “one-size-fits-all” solution, the following recommendations are a major step toward addressing this problem.

Federal, state, and local governments should:

- enact more legislation to increase and support the number of teachers of color both in the pipeline and in the classroom.
- provide additional, meaningful resources and financial support to programs that result in the successful recruitment and training of teachers of color.
- create policies to strengthen professional development programs for public school teachers in high-poverty, high-minority areas, with particular emphasis on cultural competency and mentoring.
- examine trends in teacher performance within different content areas.
- ensure that future teachers are trained with a solid, substantive curriculum, particularly in the social foundations of education. (Without understanding the historical, social, and political underpinnings of how disenfranchised groups have been systematically excluded from receiving a fair and equitable education, there will continue to be a shallow approach to understanding diversity issues.)
- encourage higher education institutions to use responsible recruitment strategies to increase the number of faculty of color in colleges and universities, particularly in colleges of education.
- provide a supportive environment at institutions of higher learning for culturally and linguistically diverse students and faculty.
- conduct research on how different ethnic groups are performing on different teacher tests as well as on who is not taking the tests and why they are not. In other words, are some prospective teachers of color leaving the field before testing because they are afraid of failing? Are some not even considering the profession because of the negative press around rates of failure by candidates of color?
- conduct research on successful efforts to increase the rate of test passage by teacher candidates of color and work with higher education institutions to develop, implement, and evaluate appropriate resources to help more teacher candidates of color pass tests.
- promote strategies for increased retention of both diverse students and diverse teachers.
- increase the amount and quality of research on all issues related to the presence, preparation, and performance of teachers of color and to culturally responsive teaching.
- include and maintain more detailed variables on race and ethnicity for all groups in research, policies, and practices about teacher education and student achievement.

The Collaborative urges all those involved in education and education policy to consider carefully the current research, to recognize the value and validity of diversity, and to join us in calling for a qualified and diverse teaching force for America’s public schools.
4.3 African American Teacher, Samuel R. Ward

“. . ., Samuel R. Ward, who had himself taught in blacks schools in both New Jersey and New York. He emphasized that blacks should insist on black teachers because blacks ought to support black talent.”

(Mabee, 1979, p. 95)
4.4 First Mexican School

The first Mexican school in El Paso during the 1880s. Mexican American parents developed a school to teach English to Mexican students with limited English proficiency because the local El Paso school officials refused to teach English to Spanish-speaking students. The community turned to an elderly man named Olivas Villanueva Aoy, who agreed to open a private school with the sole purpose of teaching Mexican children English to prepare them for public schools. Historian Mario Garcia (1981) notes that by the 1890s Aoy, with the help of two Mexican assistants, was able to teach close to one hundred first and second graders.

4.5 The Carlisle School

A Native American teacher at the Carlisle School during the early 1900s teaching American Indian weaving. The school during this period began to hire more Native American teachers and they often infused into the school curriculum the cultural and ethnic backgrounds of the students.

(Text by Anthony L. Brown)

Permission to reprint from Cumberland County Historical Society, Carlisle, PA.
The teachers in the Chinese-language schools have a good many advantages over public school teachers in a matter of practical education for the Chinese children. They speak the children’s language. They approach the parents easily and understand the pupils’ home conditions, if they would like to do so. By their experience in China and in America, they should also be able to understand the needs of the children with regard to their future cultural and vocational possibilities. As Chinese parents generally respect the teachers, according to Chinese tradition, the teachers in the Chinese school should be in the position to determine what will be most practical and useful for the children to learn in school.

(Chang, 1934, pp. 542–543)

4.7 INTASC model standards

INTASC, “Model standards for beginning teacher licensing, assessment and development: a resource for state dialogue”

Principle 1: Content knowledge
The teacher understands the central concepts, tools of inquiry, and structures of the discipline(s) he or she teaches and can create learning experiences that make these aspects of subject matter meaningful for students.

Principle 2: Child development and learning
The teacher understands how children learn and develop, and can provide learning opportunities that support their intellectual, social, and personal development.

Principle 3: Diverse learning styles
The teacher understands how students differ in their approaches to learning and creates instructional opportunities that are adapted to diverse learners.

Principle 4: Instructional strategies
The teacher understands and uses a variety of instructional strategies to encourage students' development of critical thinking, problem solving, and performance skills.

Principle 5: Learning environment
The teacher uses an understanding of individual and group motivation and behavior to create a learning environment that encourages positive social interaction, active engagement in learning, and self-motivation.

Principle 6: Communication
The teacher uses knowledge of effective verbal, nonverbal, and media communication techniques to foster active inquiry, collaboration, and supportive interaction in the classroom.

Principle 7: Instructional planning
The teacher plans instruction based upon knowledge of subject matter, students, the community, and curriculum goals.

Principle 8: Assessment
The teacher understands and uses formal and informal assessment strategies to evaluate and ensure the continuous intellectual, social, and physical development of the learner.

Principle 9: Professional development and reflection
The teacher is a reflective practitioner who continually evaluates the effects of his/her choices and actions on others (students, parents, and other professionals in the learning community) and who actively seeks out opportunities to grow professionally.

Principle 10: Collaboration and relationships
The teacher fosters relationships with school colleagues, parents, and agencies in the larger community to support students' learning and well-being.
4.8 Schoolteacher

Dan C. Lortie

RECRUITMENT AND REAFFIRMATION

The attractions of teaching

We can find what occupational characteristics attract people to a given line of work by using a model of career decisions as choices among competing alternatives. In such a model a particular occupation is presumed to "win out" over competitors because it offers greater advantage to those making choices. To identify which characteristics elicit commitments, I questioned those within the occupation, asking them to describe the attractions they saw in it and to identify those which made it more attractive than the alternatives they seriously considered. I developed this approach during earlier work on legal careers (Lortie 1958).

This section has two major parts. In the first we will review data in which teachers described the attractions they saw in teaching; the data consist of intensive interviews in five towns in the Boston metropolitan area, hereafter referred to as "Five Towns" . . ., and national surveys conducted by the National Education Association (NEA). Although the interviews were conducted and analyzed before I encountered the NEA surveys, there is sufficient convergence for joint use. The second part of the section concentrates specifically on the material benefits of teaching and their differential meaning for men and for women.

Five attractors to teaching

The interpersonal theme

One of the most obvious characteristics of teaching is that it calls for protracted contact with young people. To cite this as an attraction seems almost tautological, but this is not so when we compare teaching with other kinds of work; very few occupations involve such steady interaction with the young. It led the list of attractions among Five Towns teachers, although it is interesting that some respondents did not specify that the interactions were primarily with children—they simply said they liked "to work with people."2

"Desire to work with young people" led the selections of NEA respondents: 34 percent of the 2,316 teachers answering the questionnaire chose it. It appealed equally to men and women in the total sample, but 10 percent more elementary than secondary teachers checked it as their predominant reason for choosing teaching careers (NEA 1967, p. 47).

Contact with young people helps teaching in its competition for members; on reflection, we observe that it occupies a favored competitive position in this regard. Unlike other major middle-class occupations involving children, such as pediatric nursing and some kinds of social work, teaching provides the opportunity to work with children who are neither ill nor especially disadvantaged. Those who want such contact can visualize it taking place under "normal" conditions
which do not include sickness, poverty, or emotional disturbance. The psychological needs which underlie an interest in working with children are undoubtedly varied and complex, and there is no research which justifies the concept of a single personality type among teachers (Getzels and Jackson 1963). The care of youngsters is generally said to be especially consistent with the social definition of women’s work in our society. It is interesting therefore that the data do not show that women have a marked preference for this attraction. Perhaps it is a matter of intensity rather than extensity; but we will need subtler measures before we can settle this point.

Some Five Towns teachers preferred to talk about teaching as “work with people,” not emphasizing the age differences involved. This rhetoric suggests that they perceive interpersonal work as valuable. Rosenberg (1957) found that a large proportion of college students sought work which offered much contact with people. It is provocative, moreover, that the highest-ranked occupations in our society (high government office, the learned professions, and positions of business leadership) reveal a gregarious cast. “Working with people” carries a certain aura, and to so define the work of teachers adds dignity and enhances the self-esteem of members of the occupation.

Teachers are involved with knowledge and its diffusion; their work has also been described as an “art” requiring special sensitivity and personal creativity. Involvement with knowledge and the call for creativity could quite logically serve as foci for attraction to teaching. It is therefore interesting that neither of these aspects of the role receives as much attention as the interpersonal. More than twice as many NEA respondents chose the interpersonal theme as chose “interest in a subject-matter field,” the alternative closest to expressing intellectual interests. The NEA survey did not include interest in creativity as an option, an omission which is itself suggestive. And at most a handful of Five Towns teachers gave responses which could be construed as concern with creativity. Perhaps this points to conventionality in the sense that classroom teachers are closer to popular culture and less differentiated than, for example, artists and certain categories of intellectuals.

**The service theme**

Although their status has been shadowed, teachers have been perceived as performing a special mission in our society, and we see the continuation of that conception among those engaged in the work today. The idea that teaching is a valuable service of special moral worth is a theme in the talk of Five Town teachers. Respondents in the NEA national survey chose the option “opportunity for rendering important service” in 28 percent of the instances, making it the second most frequent response. Women were a little more inclined to stress it than were men, selecting it 29 percent of the time compared with 25 percent among men; and elementary teachers were even more inclined to favor it with a percentage of 32 compared with 23 percent of the secondary teachers.

One can argue that teaching as service is grounded in both sacred and secular aspects of American culture. To Christians, Jesus is “the Great Teacher”; teaching has been an honored vocation within the Roman Catholic church for centuries; the Jewish tradition is steeped in the love of learning. Thus those who define work as an expression of their religious faith can connect teaching with their beliefs; this gives teaching a resource of considerable potency. As we saw in Chapter 1, Americans respect the secular version of the service ideal, ranking occupation partially in such terms. The definition of teaching as service to others is a recruitment resource of some significance.

The service appeal of teaching, however, cannot be described as universal, for to see teaching as service, one must attach a certain degree of efficacy to it. It makes little sense to define teaching as service if one is skeptical about its conduct or value. One might, of course, enter teaching to change it; but as we shall see later, it is difficult to find members of the occupation who
so describe their entry. One can infer that teaching as service is more likely to appeal to people who approve of prevailing practice than to those who are critical of it.

The continuation theme

Sociologists normally depict schools as socialization agencies charged with preparing students for adult roles in other parts of the society. It is clear, however, that some who attend school become so attached to it that they are loath to leave. Five Towns teachers talked of such attachments and referred to them as attractions to the occupation. Some said they “liked school” and wanted to work in that setting; others mentioned school-linked pursuits and the difficulty of engaging in them outside educational institutions. A teacher might, for example, have affection for a hard-to-market subject like ancient history or be interested in athletics but not have the ability needed for a professional career in sports. Each can find in teaching a medium for expressing his interests. Some high school teachers told how teaching “came close” to a primary, but blocked, aspiration; an English teacher, for example, may substitute directing school plays for an earlier hope to act. Teaching can serve as the means of satisfying interests which might have originally been fostered and reinforced in school; this attraction has a built-in quality.

The NEA survey did not ask about continuing such interests, but perhaps some of those selecting “interest in a subject-matter field” fall into this category. That response drew many more high school than elementary teachers (23 percent versus 5 percent), but that could be a result of the wording, which designated specialized interest in one subject rather than general attachment to school.

A mass system of public schooling means that millions of young people move through the schools, it is hardly surprising that some develop lasting affiliations. Widespread contact with each generation is a powerful recruitment resource possessed by few occupations. Yet we must recall that the attraction of continuation is not universal among the young. The concept will probably be unattractive to those who look forward to new experience and novel challenges; to “stay in school” will strike some as surrendering their passport to engage in specifically adult activities. Is it not likely, therefore, that fewer of those who opt to continue with school will have a strong interest in the new and untried? It also seems probable that those who feel positive enough about school to stay with it will be more likely to approve of existing arrangements and will be less motivated to press for change. The continuation theme, in short, appears to have a conservative bias.

Material benefits

There are reasons why teachers underplay the role of material rewards in their decision to enter the occupation. Historically the status has been defined as under rewarded; teachers addressing others may hesitate to cite material benefits when in the public eye such rewards are said to be inadequate. But I suspect that the emphasis on service, on teachers as “dedicated,” is a more potent source of inhibition, since many people both inside and outside teaching believe that teachers are not supposed to consider money, prestige, and security as major inducements. Such normative pressures make it probable that material benefits influence teachers’ decisions more than their answers indicate. There is indirect evidence, at least, that such normative inhibition is at work; we will discuss it after summarizing the direct data.

More Five Towns teachers were willing to list material benefits as attractions to teaching than as key factors in their decision to teach (these benefits include money, prestige, and employment security). The NEA study included two benefits as possible “predominant reasons”; 6 percent chose “security” and only 2 percent “financial rewards.” Men were slightly readier to cite security (8 percent versus 5 percent) and women, money benefits (2.1 percent versus 0.6 percent). The NEA options did not include prestige.
There are two aspects of teaching which make the few references to material benefits puzzling. Viewed in the context of occupations with a large proportion of women, teaching salaries are not notably deficient, particularly when the relatively fewer working days per year are taken into account. The usual alternatives considered by women teachers normally offer no greater income and may, in fact, offer less. The other fact that leads one to expect greater emphasis on material rewards is that a significant proportion of men who teach come from homes marked by economic insecurity and low social status.

The thought that normative inhibitions reduce teachers' readiness to include material benefits among the major attractions gains support from indirect data gathered in Five Towns. Respondents were asked why other teachers were in the occupation—they were asked to project motivations onto unnamed others rather than to talk about themselves (question 39, Appendix B-1). Using categories for money, security, and prestige and an additional one for time compatibility, we find provocative differences in the distributions of self-ascribed and other-ascribed motivations. The theme of service increases on the "projective" item, suggesting that if normative inhibitions are indeed less there may be more references to idealistic considerations: 42 percent of the answers about others refer to service compared with 17 percent in the self-descriptive, major factors question. The most striking difference, however, refers to material benefits. In the projective item, the general category had to be subdivided to accommodate the more frequent mentions. Although all material benefits together were mentioned only 6 percent of the time on the self-descriptive item, each single benefit elicited frequent mentions in the projective question (money, 37 percent; security, 34 percent; and prestige, 12 percent). Respondents who were reluctant to depict material benefits as influential in their own cases show no such hesitation when interpreting the behavior of teachers in general. Interpretation of such a difference is hazardous—it might, for example, imply depreciation of colleagues rather than a projection of personal feelings. But it does at least suggest that these respondents are aware of the drawing power of material benefits.

The differences by sex in the question about other teachers' interests are also provocative. A category had to be included for those who said, one way or another, that "teaching is a good job for women." (The 19 percent involved both men and women.) But men and women differed in their emphasis on money as an attraction; 54 percent of the women and 39 percent of the men alluded to it. The fact that more than half the women teachers saw money as a positive feature in attracting and holding others indicates that we should be skeptical about the 2 percent statistic in the NEA study. One is forced to wonder, in fact, at the reliability of subjective testimony on this matter. I suspect that the research we need to estimate the effects of material benefits on recruitment should focus on the decisions people make rather than on their later interpretation.

The theme of time compatibility

The working schedules of teachers have always been special; although the length of the school year has increased steadily over the last century, most Americans are required to work considerably more days per year than the average teacher. Teachers are sensitive to criticism about this, and one senses that reaction in the statistics their national association gathers to show that teachers actually work longer hours than formal school schedules require (NEA 1972, p. 34). The fact remains, however, that the teacher’s schedule features convenient gaps which play a part in attracting people to the occupation. Work days which are finished in midafternoon, numerous holidays, and long summer vacations do not go unnoticed by young people comparing teaching with alternative possibilities.

As with material benefits, more Five Towns teachers listed the work schedule as an attraction than were ready to accord it a major role. It figured prominently, however, in the question where respondents were asked to interpret the behavior of other teachers; in that context, 44 percent mentioned it, and women did so often than males—54 percent versus 26 percent.
Five Towns respondents who said that schedules attracted them related working hours to other obligations and pursuits. The dominant obligations referred to were those associated with wifehood and motherhood; the schedule permits time for shopping, household duties, and so on, and matches the schedules of school-age children. Although a few men mentioned compatibility with family life as an attraction, more pointed out that teaching schedules allowed them to undertake further study or do other kinds of work.

The compatibility of teaching schedules is probably a potent recruitment resource; few occupations can offer men and women with other interests such flexibility. Yet it has some disadvantages. Teachers are sometimes criticized for having “easy jobs” (Vidich and Bensman 1958). Occupational leaders do not seem inclined to use this attraction to obtain recruits; they probably feel that it is inconsistent with the occupation’s status as a service field and that treating teaching as a means to other ends tends to reduce its intrinsic value. One suspects, moreover, that those who are drawn into teaching primarily by this attractor are less likely to identify strongly with the occupation and its interests. One would not expect people who selected teaching because it made limited claims on their time to give long hours of extra service. If this is so, compatibility is also indirectly conservative in its effects; change in an occupation normally requires extra effort from its members.

The testimony of classroom teachers makes it clear that the occupation possesses potent attractors. Teaching is special in at least two respects: few occupations can offer similar opportunities for protracted contact with normal children, and few can provide such compatible work schedules. The definition of teaching as service (the aura of its mission) sets it apart from many other ways to earn a living. Schools instill interests and attitudes which help recruit the next generation of faculty members. Although muted, material benefits play their part in drawing persons into the occupation.

Analysis of the appeal of the several attractors, however, reveals important limits on their scope; taken together, they affect the distribution of values we would expect to find among new entrants. There is a reiterated emphasis on conserving the past rather than changing educational institutions, implicit in the themes of service and continuation. The tendency of teachers to stress the interpersonal suggests conventionality rather than a special, deviant point of view; the operation of time compatibility is probably indirectly conservative. We are speaking, of course, of propensities and probabilities rather than of absolutes, of a bias toward continuity rather than of a uniform predisposition common to all teachers. What makes these propensities of special interest, however, is that they reappear when we examine the circumstances which facilitate entry to teaching. Those circumstances and the accompanying facilitators will be discussed immediately after the next section.

Material benefits and sex differences

The reluctance of teachers to link their entry to material benefits need not deter us from trying to understand how such attractions affect recruitment and, in particular, influence the sex composition of the occupation. In Chapter 1, I pointed out that the types of material benefits proffered by teaching are likely to operate somewhat differently for men and women. Although each attracts members of both sexes, each appears to vary in the meaning (and possible intensity) it has for them. I will review three kinds of material benefits from this point of view, using data from Five Towns and from national surveys.

Money income and alternatives foregone

Occupational choice is an either-or decision where one selection rules out others, most likely permanently. Economists have a useful concept which they use as part of the calculus of rational
choice—the idea of “alternatives foregone.” We can extend the concept and think of any given selection as being more of less subjectively costly to individuals (and categories of individuals) when we take into account the aspirations set aside when, for whatever reasons, they enter a given line of work. When we make this transposition into a social psychological definition, we need not assume that rational choices were made or, in fact, that the sacrificed aspirations were indeed assured. Approached this way, it turns out that entering teaching is subjectively more costly for men than for women.

Approximately three-quarters of the Five Towns teachers considered another occupation before entering teaching (question 9, Appendix B-1). All the alternatives they mentioned were middle-class and upper-middle class occupations, and 59 percent were interpersonal work with some element of public service. They were not aiming low in their work aspirations. But men and women did not choose teaching from the same list of possibilities. Whereas the men considered business administration and the professions, women thought about semiprofessions (nursing, library work, and social work), office positions, and the performing arts. Except for a small number of women who entertained hope of working in the high-prestige professions, there was no overlap in the alternatives men and women considered. Teaching is the one occupation on which both sexes converged.

It is evident that men and women will feel that they sacrificed different levels of income (and prestige) in order to teach. With the exception of the performing arts, the women’s alternatives are marked by similar or lower earnings. One can become rich and famous in the performing arts but such success is rare. Young women who opt for teaching (or parents who influence them to do so) are not usually following a course which involves material sacrifice. Men who enter teaching, however, find it less difficult to avoid feeling that their teaching careers have brought them less than the alternatives would have yielded; the lifetime earnings of business executives and professionals (and their social positions) clearly exceed those of classroom teachers.

Economists will argue that what has been said will make teaching less attractive to men than to women and that this will perpetuate female dominance of teaching ranks. Granted. What I wish to point out, however, is that some men do become teachers and that their sense of loss has a depressing effect on the recruitment of younger men. We can reason that male teachers will have greater material motives for regretting their fates and are thus less likely to project high enthusiasm for their work. We will see later that identification with teachers plays an important part in recruitment and that young men and women tend to identify with members of the same sex. To the extent that a subjective sense of deprivation makes male teachers less acceptable as models, there is a systematic tendency for the occupation to attract more women than men. The differential distribution by sex of material rewards of money and prestige therefore probably has effects beyond its role in the original calculus of choice.

Social mobility

The special mission of teachers gives their occupation a standing somewhat higher than we would expect solely on the basis of income. We have just alluded to the limits on the prestige of the occupation when it is compared with the highest ranked fields; it is useful, however, to examine the other side of the stratification equation. Teaching is clearly white-collar, middle-class work, and as such offers upward mobility for people who grew up in blue-collar or lower-class families.

Although it is a truism that teaching has benefited from its position as a mobility ladder, it remains difficult to obtain precise information on how many teachers have ascended by entering the occupation. There are thorny technical problems in making estimates on the matter, especially in classifying the original social rank of teachers whose parents were engaged in farming. We can, however, confirm the presence of considerable upward mobility by making conservative use of available data.
A national sample study conducted by the NEA reveals that “the social backgrounds of teachers come close to representing a cross-section of the American public,” except for a slight upward bias (NEA 1963, p. 15). Thirty percent of the teachers sampled came from homes where the father was a blue-collar worker. A crude index of mobility within teaching, therefore, is provided by the difference between offspring and their parents; since teaching outranks blue-collar occupations, the sons and daughters of blue-collar parents have climbed significantly by entering teaching (National Opinion Research Center 1953). The procedure is conservative, however, in that it disregards mobility among those who came from lower-status rural families. Using the 30 percent figure, we can estimate that in an occupation now numbering over two million members, somewhere around six hundred thousand persons have crossed the boundary between blue-collar and white-collar work. Teaching appears to be one of the more important routes into the middle class.

Men and women do not benefit equally from these mobility gains. The NEA data disclose that women teachers typically originate in higher-status homes than men in the occupation; for example, more men teachers’ fathers were blue-collar workers. Perhaps the disparity stems in part from the differential opportunities perceived by women and men. We noted that within the usual framework of possibilities considered by women, teaching ranks high; it can appeal, therefore, to relatively advantaged women. With their wider range of possibilities, men are less likely to choose teaching if they have socioeconomic advantages. But whatever underlies the disparity, teaching is a more important medium of upward mobility for men than for women.

The subtle differences in the meaning of mobility and prestige for men and women in teaching makes it risky to assign it much greater salience for one or the other. From available data we can infer that mobility as such draws in more men. Yet the acceptability of the occupation for women of higher social background also facilitates their entry. It seems, then, that the social rank of the occupation recruits differentially among men and women, influencing members of both sexes but producing recruits of somewhat different social class backgrounds.

**Employment security**

American work ideologies tend to denigrate impulses toward employment security, and occupations are sometimes derided by calling their incumbents “security-seekers.” This ideology seems a poor description, however, of the economic behavior of many who voice it: the readiness to take protracted risk does not appear abundant. Our task here, however, is not to analyze the gap between ideology and reality in American society, but to uncover some of the meanings security has for men and women in teaching. Employment security is basic to other work rewards; the unemployed earn none.

Anyone studying teaching during the sixties was bound to encounter men whose fathers were on the fringes of the economy during the Great Depression of the thirties. Teachers who grew up in those years (particularly in working-class homes) can have sharp recollections of the pain of economic insecurity. The NEA survey I have referred to makes it clear that a noteworthy proportion of male teachers came from homes where the breadwinner had little protection against unemployment or underemployment during the depression. It seems highly probable, therefore, that some of these men, upon being discharged from the armed services at the end of World War II, chose to use their educational subsidies to prepare for work which was more secure than their fathers’. The flow of veterans into teaching during the postwar years is therefore related to the depression; college education was an unexpected boon for some, and although they may have dreamed of higher-income occupations, it seems likely that they valued the security proffered by classroom teaching.

Women have somewhat different reasons to appreciate the security of teaching. Fewer women grew up in economically vulnerable homes and even fewer would have expected to play the role
of principal breadwinner. Employment security can, however, be meaningful to both single and married women. The single woman is assured of a predictable income without having to compete aggressively with men. For those who marry, the economic aspects of security are probably less important, but there are psychological and family-connected benefits. The absence of employment anxiety after tenure has been attained helps to make teaching compatible with marriage and motherhood. If these married women were forced to compete actively to hold their jobs, it would be considerably more difficult for them to balance rival claims of work and family. Employment security makes it easier for married women “to keep work in its place.” If they must miss time at work, as when a child is ill, they need not fear discharge. Given the complexities which confront women who combine marriage and motherhood with full-time employment, security gives leverage in an intrinsically delicate situation.

Security is an important recruitment resource for teaching, and I suspect that it exerts more influence than teachers are ready to accord it. The NEA survey indicated that more men than women were ready to assign it a key role in their entry, but the difference was only 3 percent. Since it serves valued purposes for members of both sexes, it is not critical in perpetuating the predominance of women. But we should not be surprised when teachers react strongly to perceived threats to their economic security—a case in point is the New York strike of 1968 (Mayer 1969).

Among the material benefits of teaching, it appears that money most clearly differentiates the appeal of teaching for men and women. Men place teaching salaries in a different comparative context, and they are thus considerably more attractive to women than to men. What makes great change unlikely is that the marginal utility of additional salary is greater for women than for men; attempts to draw in more men by raising general salaries are likely to produce a greater number of highly qualified women applicants. Employers are faced with a dilemma. Are there controlling reasons to hire men even where their qualifications are less impressive than those of available women? Even if some employers were so convinced, could they implement such policies in view of the adverse public sentiment symbolized by the Women’s Liberation Movement, laws proscribing discrimination against women, and the collective power of women in teacher organizations? It seems most doubtful. Traditional modes of compensating teachers are likely to enhance the continued preponderance of women in classroom teaching.

TWO GENERAL FACILITATORS

We observed in Chapter 1 that entry to teaching has been facilitated by such mechanisms as highly accessible training and nonelitist admission standards. Two other ways entry to teaching is eased have something in common—each broadens the pool of potential candidates for the occupation.

The wide decision range

Some occupations have a narrow “decision range” because they are not visible to the very young or because they require that the first of a mandatory series of decisions be made at an early point. Few youngsters, for example, are sufficiently aware of actuarial science to choose it at an early age; at the other end of the scale, it is difficult to become a concert musician or a physician if one has not taken the preparatory steps early in life. Occupations which discourage early decisions or constrict later ones will at any time have smaller pools of potential candidates than those with wide “decision ranges.”

People can decide to become teachers at any of a number of points. Since the occupation is ubiquitous and highly visible in the lives of children, it can easily figure in their fantasies about
adult occupational activity; even young children can make persisting decisions to enter teaching. At the other end of the continuum, it is possible to decide on teaching late and still implement the decision: in Five Towns, for example, several people decided in their thirties to enter teaching. There are supports for decisions made both early and late; since teaching is perceived as among the more accessible occupations, adults feel less pressure to protect youngsters who wish to teach against their possible disappointment; and training institutions have been ready to admit, and school systems to hire, “older” people.

There are indications in Five Towns and in other samples that variations in the age of decision are patterned by sex and school level. Thus 63 percent of the women teachers in Five Towns decided before they graduated from high school, but only 24 percent of the men did so; 41 percent of the men, in fact, waited until their last year in college or later to commit themselves to teaching (question 6, Appendix B-1). Kronus found a similar sex difference in her sample, and Benjamin Wright found that women considered teaching earlier than men did (Kronus 1969, p. 23; Wright, personal communication). With sex held constant, elementary teachers in Five Towns and in Wright’s sample decided earlier than secondary teachers. Women, especially those who select elementary teaching, are the most eager recruits; men are more hesitant.

A wide decision range has other consequences in addition to enlarging the candidate pool: one is heterogeneity in patterns of entry. One might expect early decisions to show more affective properties than those made by older people, who have more information; late decisions, on the other hand, may point to considerable “compromise” as hopes and plans are realistically assessed (Ginzberg et al., 1951). Some teachers, therefore, will talk about teaching in glowing terms, as a “calling” they chose early and have given unwavering commitment; others will talk about their choice as a compromise with reality’s demands. This is a potential source of cleavage among teachers since those at each extreme may be uncomfortable about the others’ valuations of teaching.

The heterogeneity of entry patterns indicates that teaching is not, in this regard, standardized by professional consensus, nor is its membership carefully screened through shared criteria for admission. Consequently there is considerable self-selection; the motivation, orientations, and interests candidates bring are not systematically assessed to eliminate those whose characteristics fail to fit a particular model. As we shall note in later chapters, diversity so permitted has important consequences for the inner life of the occupation.

The subjective warrant

Licenses to practice regulated occupations are issued by governments after candidates have passed the stipulated examinations. But this is the culmination of a longer process during which individuals have played a critical part by qualifying or disqualifying themselves; those who sustain an ambition have tested and retested themselves in terms of a personal conception of what their goal will demand, and have in their own eyes passed those tests. We find examples in adolescent boys’ testing their dexterity to see whether they have “surgeon’s hands” or arguing with peers to see whether they might succeed in law. It is instructive to know what people think is required for success in a given work role, for this indicates the subjective filters associated with the occupation—its “subjective warrant.” Occupations with stringent warrants will lose more would-be members through self-discouragement than will those with permissive warrants.

Given the tendency to ease entry into teaching, we might expect to find that subjective tests are also less stringent. We can examine this possibility with data gathered in Five Towns, where teachers told what personal qualities they thought suited them for teaching (question 11, App. B-1). Analysis produced three types of answers: (1) statements of personal preference; (2) references to interpersonal capacities and dispositions; and (3) allusions to intellectual interests and abilities. A quarter of the responses fell into the first category, with such answers as
"I liked children and wanted to work with them." The model response, however, dealt with personal characteristics like patience, a sense of humor, leadership ability, and a calm and self-possessed nature (slightly over half selected those). The third category, intellectual strengths and interests, was mentioned least, getting fewer than a fifth of the responses. These responses included knowledge of a subject, intelligence, being well-organized, and enjoying learning. Interpersonal qualities and preferences were mentioned more than three times as often as intellectual attributes in Five Towns; such differences, even in a limited sample, command attention. This emphasis on the interpersonal is consistent with the themes of attraction we examined earlier.

The subjective warrant implied by the Five Towns data is not stringent. The preferential responses are logically circular: wanting to teach becomes justification for doing so. Interpersonal qualities, even though not possessed by everyone, suggest a plastic rather than a resistant warrant—one which an individual can shape to suit his purposes. It is difficult, after all, to be sure one does not possess the cited qualities. Intellectual criteria, on the other hand, are rendered "scarce" by academic grading systems which depend upon ranking. The question is not whether respondents selected "the best criteria" but rather the effects of using a particular set of criteria. The attributes teaches chose—preferences and interpersonal characteristics—were less likely to force self-elimination than would more stringent standards of self-assessment. The data suggests that there is a social psychological correlate to structurally eased entry; in both instances the hurdles are set at the lower notches.

A final comment. It is interesting that the permissive warrant fits so neatly with the existence of early and late deciders. It prevents those making early decisions from seeing the aspiration to teach as ridiculously high. It also helps those making late decisions to avoid worry about their lack of protracted and specialized preparation for the role: since personality and preference rule, other considerations are secondary. One also observes that the content of the warrant has a "feminine" ring; it emphasizes expressive qualities which, as Parsons and Bales (1955) point out, are presumed to differentiate women in the American division of labor between the sexes.

NOTES

1 This chapter was planned and written before the publication of the 1972 report from the National Education Association (Status of the American Public-School Teacher, 1970–1971 [Washington, D.C.: Research Division, National Education Association, research report 1972-R3]). It is based primarily on two earlier reports (NEA 1963-M2 and 1967-R4); I have, however, added observations from the later report in the notes where it seems appropriate.

2 The wording of the questions can be found in Appendix B [removed]; for Five Towns, see Appendix B-1. In this instance, the two questions are numbers 8 and 10 in the Five Towns interview. Henceforth, I shall indicate the relevant question in parentheses in the text.

3 On question 8 (attractions to teaching), 14.4 percent of the respondents made reference to teaching as valuable service. On question 10 (most important factors in your decision), 17.3 percent responded in this fashion.

4 6.7 percent said that they "like school" and wished to continue in work related to it; 12.2 percent said they were interested in a particular subject. The last NEA survey (1972-R3) asked specifically about "interest in a subject-matter field," and 34.5 percent of the respondents selected it as one of three reasons they decided to become teachers. Men chose it more often than women (46.6 percent verses 28.2 percent) and high school teachers more often than elementary teachers (57.0 percent compared with 14.3 percent). The survey does not break data down by sex within level of schooling, but it appears that interest in a particular subject is highly associated with level of schooling.

5 References to material benefits total 16.7 percent including money, prestige, and security in the attractions question and 6.2 percent in the key factors question.

6 The mean number of days teachers reported as scheduled for their regular school year in 1970–71 was
181 (National Education Association 1972, p. 134). Americans who work five days a week with three weeks vacation and eight holidays annually put in 237 days a year.

7 Although 13 percent included work schedule among the attractions, only 4 percent listed it among the major factors influencing their decision to enter teaching.

8 The most recent NEA survey included a reference to “long summer vacation”; 14.4 percent of all respondents included it as one of three reasons for entering teaching (NEA 1972, p. 160).

9 A refined estimate of social mobility would have to include measurement of net upward mobility—some teachers occupy statuses lower than their parents’. Given the data in hand, it is not wise to undertake anything more precise than the discussion in the text. Farmer fathers, for example, can be owners or renters, prosperous leaders in their communities or impecunious sharecroppers. The same problems hold for self-employed fathers, who can own major or minor enterprises.

10 In 1971, 43.9 percent of men in teaching had fathers who were unskilled, semiskilled, or skilled workers compared with 29.0 percent of the women (NEA 1972, p. 61).

11 In one of the pilot interviews I conducted, one teacher told of a fisherman father who, after four days at sea, was forced to sell his share of the catch for twenty-five cents.

Part 4
Commentaries
Few educational issues have received more attention in recent times than the problem of ensuring that our nation’s elementary and secondary classrooms are all staffed with quality teachers. There is a general consensus that the quality of teachers and teaching matter—both are undoubtedly among the most important factors shaping the learning and growth of students. Moreover, there is a general consensus that serious problems exist with the quality of teachers and teaching in the U.S. Beyond that, however, there appears to be little consensus and much disagreement over what teacher quality entails, who should and should not be allowed to teach, and especially what are the sources of, and solutions to, the teacher quality problem. In this commentary section, I will briefly discuss three related diagnoses and their attendant prescriptions: restrictive occupational entry barriers; shortages of teachers; inadequate teacher preparation. These three are not the only explanations given for the purported problem of low quality of teachers and teaching. Nor are these views universally believed—indeed each is the subject of much contention—and proponents of one are at times opponents of another. But all are prominent views, all are part of the conventional wisdom as to what ails teaching and all have had an impact on research, reform and policy.

The thesis of this commentary is, however, that each of these three views is largely incorrect. My theoretical perspective is drawn from the sociology of organizations, occupations and work. My operating premise, drawn from this perspective, is that fully understanding issues of teacher quality requires examining the character of the teaching occupation and the social and organizational contexts in which teachers work. In the following sections I briefly review each of the above views and explain why I believe each provides an inaccurate explanation of, and inadequate solutions to, the quality problems plaguing the teaching occupation.

OVERLY RESTRICTIVE OCCUPATIONAL ENTRY

There is much debate over the qualifications deemed necessary for entry into, and success in, the teaching occupation. How much and what kinds of preparation, training and certification should we require in order to yield quality classroom teachers? On one side of the debate, are those who argue that a primary source of low-quality teaching has been a lack of depth, rigor, and breadth in pre-service training and certification (Interstate New Teacher Assessment and Support Consortium, 1992; National Commission on Teaching and America’s Future, 1996, 1997). This viewpoint, to which I will return to in the last section of this commentary, holds that we simply have had too few requirements and too low standards. Accordingly, proponents of this view seek to upgrade and expand the education, training, and certification standards required of new teachers.
On the other side, are those who hold that entry into the teaching occupation is already plagued by unusually restrictive and unnecessary rigid bureaucratic entry barriers (Finn et al., 1999; Hanushek & Rivkin, 2004; U.S. Department of Education, 2002; Walsh, 2001). From this latter viewpoint, traditional teacher training and state certification requirements are akin to monopolistic practices. These critics argue that there is no solid empirical research documenting the value of such entry requirements. These regulations, such critics charge, are less motivated by an interest in protecting the public and are really about protecting the self interest of key constituencies involved with the education system. As a result, this view holds, large numbers of high quality candidates are discouraged from getting into the occupation. By doing away with these impediments, this argument concludes, schools could finally recruit the kinds and numbers of candidates they deem best and this would solve the quality problems that plague the teaching force.

There are a number of different variants of this anti-restrictive-entry perspective. One of the more popular favors a training model analogous to that dominant in higher education. The pre-service preparation of professors often includes little formal training in instructional methods. Similarly, from this viewpoint, having an academic degree in a subject is sufficient to be a qualified secondary school teacher in that subject. From this viewpoint, content or subject knowledge—knowing what to teach—is considered of primary importance for a qualified teacher. Formal training in teaching and pedagogical methods—knowing how to teach—is considered less necessary (Finn et al., 1999). Another variant of the anti-restrictive-entry perspective is motivated by concern for the demographic diversity of the teaching force. From this viewpoint, teaching’s entry requirements result in reduced numbers of minority candidates entering the occupation, either because the requirements are themselves racially or ethnically biased, or because they screen out otherwise worthwhile candidates who are unable to pass over particular hurdles because of an underprivileged background (National Collaborative on Diversity in the Teaching Force, 2004; Villegas & Lucas, 2004).

Proponents of these various anti-restrictive-entry perspectives have pushed a range of initiatives, all of which involve a loosening of the traditional entry gates, including alternative certification programs, and Peace Corps-like programs, such as Teach for America.

To be sure, there are at least two problems with existing teaching entry requirements. First, such requirements sometimes keep out capable candidates. In short, not everyone needs such qualifications to be a quality teacher. Second, and conversely, entry requirements sometimes do not keep out some who ought not be in this particular line of work. That is, having obtained credentials and completed exams does not, of course, guarantee an individual will be a quality teacher, nor even a qualified teacher.

But, these two problems are true in all occupations and professions. For example, there are no doubt otherwise highly capable individuals who cannot practice law because they did not complete a law school program and pass a state bar exam. Alternatively, there are no doubt individuals who completed law school, passed a bar exam, but who ought not to be lawyers.

It is useful to place teaching’s entry and training requirements in context. The restrictiveness of occupational entry requirements is relative and when evaluating the norms and rules governing a particular occupation the question must always be posed—compared to what?

One useful comparison is cross-national. Compared to the U.S., how restrictive and rigorous is entry into the teaching occupation in other developed nations? Interestingly, one recent comparative study has concluded that the filters and requirements embedded in the process of becoming a teacher in the U.S. are less rigorous, less arduous and less
lengthy than those in a number of other nations, including Australia, England, Japan, Korea, Netherlands, Hong Kong, and Singapore (Wang et al., 2003). This warrants further investigation—a project I am now undertaking.

Another useful comparison is cross-occupational. Sociologists of work, organizations and occupations have traditionally characterized teaching as a relatively complex form of work, characterized by uncertainty, intangibility, and ambiguity, and requiring as high a degree of initiative, judgment, and skill to perform at a high level as do some of the traditional professions (Bidwell, 1965; Kohn & Schooler, 1983; Lortie, 1975). However, in contrast to the deregulation perspective, sociologists of work, organizations and occupations have also traditionally characterized teaching as a relatively easy-in/easy-out occupation, with a relatively low entry bar, and a relatively wide entry gate, especially in comparison to the traditional professions (Etzioni, 1969). In his classic study of the teaching occupation, Dan Lortie (1975) drew attention to a number of aspects and mechanisms that facilitate ease of entry. Most of those who desire to enter the teaching occupation are free to do so—a characteristic Lortie labeled the “subjective warrant.” In contrast, the opposite prevails in many occupations and most traditional professions. Especially in the latter, occupational gatekeepers have a large say in choosing new members and not all who desire to enter are allowed to do so.

Ironically, although teaching’s entry training and licensing requirements are lower than those for many other occupations in the U.S., and lower than in some other nations, they appear to be subject to far more scrutiny than those in other occupations. There is an extensive body of empirical research, going back a couple of decades, devoted to evaluating the effects of teacher credentials on student performance and, not surprisingly, the results from this literature are often contradictory (Allen, 2003). But, a number of studies have indeed found teacher education or licensure, of one sort or another, to be significantly related to increases in student achievement (Greenberg et al., 2004; Greenwald et al., 1996; Raudenbush et al., 1999).

Scrutiny of the added value of entry requirements is, of course, useful from the perspective of the public interest. But, it can also be useful to place this research itself in a cross-occupational comparison. Typically for most occupations and professions, there is little or no empirical research done assessing the value added of practitioners having a particular credential, license or certification (American Educational Research Association, American Psychological Association, & National Council on Measurement in Education, 1999; Kane, 1994). Such research can be difficult to undertake; for instance, if licensure is mandatory in an occupation, it may be impossible to compare the performance of those licensed with those unlicensed. Nevertheless, occupational entry requirements, whether by precedent, or by law, are common. For example, almost all universities require a doctorate for full-time academic positions. However, there are very few examples of a “professor effects” literature that examines whether professors’ qualifications have a positive effect on student achievement or on research quality (Pascarella & Terenzini, 1991). In other words, in academia as in most occupations and professions, it appears that it is taken as a given that particular credentials are necessary to practice particular kinds of work. Hence, from a cross-occupational perspective, the interesting research question is not solely, ‘Do qualifications matter for teachers?’, but also, ‘Why do so many find this an important question?’ Is teaching held to up to more scrutiny and skepticism than other occupations and, if so, why?

Regardless of their impact on recruitment, the data also suggest that increasing or decreasing entry qualifications, alone, will not solve the problem of ensuring a quality teacher in every classroom if it does not also address the issue of teacher retention—the subject of the next section.
TEACHER SHORTAGES

A second and related explanation for the problem of low quality teaching in American schools is teacher shortages. In this view, the main source of the problem is that the supply of new teachers is insufficient to keep up with the demand. Restrictive entry requirements may exacerbate this condition, but the root of this gap, it is widely believed, is a dramatic increase in the demand for new teachers primarily resulting from two converging demographic trends—increasing student enrollments and increasing teacher retirements due to a “graying” teaching force. Shortfalls of teachers, this argument continues, have meant that many school systems have not been able to find qualified candidates to fill their openings, inevitably resulting in the hiring of underqualified teachers, ultimately lowering school performance.

The prevailing policy prescription and response to these school staffing problems has been to attempt to increase the quantity of teachers supplied through a wide range of recruitment initiatives. Some of these involve a loosening of entry requirements, some do not. Overseas recruitment, financial incentives, such as signing bonuses, student loan forgiveness, housing assistance, and tuition reimbursement have all been used (Hirsch et al., 2001).

The data, however, raise serious doubts for the success of these kinds of initiatives. In my own research I have shown that the main source of school staffing problems is not shortages—in the sense of too few new candidates being produced—but rather too many existing teachers leaving their jobs (Ingersoll, 2001, 2003b). Most of the demand for new teachers is not driven by student enrollment or teacher retirement increases, but from pre-retirement teacher turnover. The data portray a “revolving door” occupation in which there are relatively large flows in and out of a significant portion of schools each year. It is also an occupation that loses many of its newly trained members very early in their careers. The data indicate that as many as half of those trained to be teachers never enter teaching, and another 40–50 percent of those who do enter, leave the teaching occupation either temporarily or permanently in the first five years on the job. Moreover, the data tell us that the overall amount of turnover accounted for by retirement is relatively minor when compared to that resulting from other causes, such as teacher job dissatisfaction and teachers seeking better jobs or other careers.

These findings have large implications for current policy—they suggest prescriptions must focus less on recruitment and more on retention. In short, recruiting more teachers will not solve the teacher crisis if large numbers of such teachers then leave. The image that comes to mind is a bucket rapidly losing water because of holes in the bottom. Pouring more water into the bucket will not be the answer if the holes are not first patched.

THE PROBLEM OF UNDERQUALIFIED TEACHERS

A third prominent explanation of low-quality teaching focuses on the adequacy of the qualifications of prospective teachers. In this view, as noted earlier, a major source of low quality teaching is low quality pre-service education, training and certification standards (National Commission on Teaching and America's Future, 1996, 1997). In contrast to the deregulation perspective, this group seeks to expand the training and certification standards traditionally required of new teachers. In response, reformers in many states have pushed tougher certification requirements and more rigorous coursework requirements for teaching candidates.
Upgrading teacher preparation programs and teacher certification standards certainly may be necessary and helpful. However, like many similarly worthwhile reforms, these efforts alone will also not solve the problem of underqualified teachers because they do not address some key causes. One of the least recognized of these causes is the problem of out-of-field teaching—teachers being assigned to teach subjects which do not match their training or education. From a policy perspective, this is a crucial issue because highly qualified teachers may become highly unqualified if they are assigned to teach subjects for which they have little training or education.

In my own research I have found that out-of-field teaching is a chronic and widespread problem. For example, about one third of all secondary (grades seventh to twelfth) math classes are taught by teachers who do not have either a major or a minor in math, or related disciplines such as physics, statistics, engineering or math education. Almost one quarter of all secondary school English classes are taught by teachers who are not certified in English. Some out-of-field teaching takes place in well over half of all secondary schools in the U.S. in any given year. Each year over one fifth of the public seventh to twelfth grade teaching force does some out-of-field teaching (Ingersoll, 1999, 2004a).

Typically, policy-makers and analysts have assumed that the problem of out-of-field teaching is a result of teacher shortages. The conventional wisdom holds that shortfalls in the number of available teachers have led many school systems to resort to assigning teachers to teach out of their fields (National Commission on Teaching and America’s Future 1996, 1997). This is clearly a factor, but, out-of-field teaching cannot be entirely explained by teacher shortages. The data show, for example, high levels of out-of-field teaching exist in fields, such as English and social studies, long been known to have surpluses. Rather than deficits in the qualifications and quantity of teachers, the data point in another direction—out-of-field teaching is really an issue of human resource management and mismanagement. The data tell us that decisions concerning the allocation of teaching assignments are usually the prerogative of school principals (Ingersoll, 2003a). School managers are charged with the often difficult task of providing a broad array of programs and courses with limited resources, limited time, a limited budget, and a limited teaching staff (Delany, 1991). In this context, principals appear to find that assigning teachers to teach out of their fields is often more convenient, less expensive and less time consuming than the alternatives. For example, rather than find and hire a new part-time science teacher to teach two sections of a newly state-mandated science curriculum, a principal may find it more convenient to assign a couple of English and social studies teachers to each “cover” a section in science. If a teacher suddenly leaves in the middle of a semester, a principal may find it faster and cheaper to hire a readily available, but not fully qualified, substitute teacher, rather than conduct a formal search for a new teacher. When faced with a tough choice between hiring an unqualified candidate for a science teacher position or doubling the class size of one of the fully qualified science teachers in the school, a principal might opt for the former choice—resulting in a smaller class, but taught by a lesser qualified teacher. If a full-time music teacher is under contract, but student enrollment is sufficient to fill only three music classes, the principal may find it both necessary and cost effective in a given semester to assign the music teacher to teach two classes in English, in addition to the three classes in music, in order to employ the teacher for a regular full-time complement of five classes per semester. All of these managerial choices to misassign teachers may save time and money for the school, and ultimately for the taxpayer, but they are not cost free. They are a large, and until recently, under-recognized source of the problem of underqualified teachers in classrooms.

These findings have implications for current policy. The efforts by many states to
recruit new teachers, to enhance their training, to enact more stringent certification standards, and to increase the use of testing for teaching candidates, although perhaps highly worthwhile, will not eliminate out-of-field teaching assignments and, hence, alone will not solve the problem of underqualified teaching in our nation’s classrooms. In short, bringing in thousands of new candidates and mandating more rigorous coursework and certification requirements will help little if large numbers of such teachers continue to be assigned to teach subjects other than those for which they were educated or certified.

Rather than deficits in the quantity or quality of teachers, the data point in another direction. As with the two other views (restrictive occupational entry barriers and teacher shortages), the data indicate much of the conventional thinking on the sources of the teacher quality problem suffers from serious limitations. Rather the data suggest that if we want to fully understand and also address these problems, we must also examine the character of teaching as an occupation and the character of schools as organizations.

NOTE

1 This commentary draws from an earlier paper (Ingersoll, 2004b) published as chapter 1 in Mark Smylie and Debra Miretzky (eds.) 2004, Developing the Teacher Workforce, the 103rd Yearbook of the National Society for the Study of Education. Chicago: National Society for the Study of Education.

29 Changing the paradigm
Preparing teacher educators and teachers for the twenty-first century

Mary H. Futrell
George Washington University

Tell me, and I forget. Teach me, and I may remember.
Involve me, and I learn.

Benjamin Franklin

One of the longest reform movements in recent United States history has focused on the need to improve the quality of our education system. For more than 50 years, local, state and federal leaders have been engaged in a debate about why the education system should be transformed, how much and by whom. As early as the 1950s, when the Brown vs. Board of Education decision desegregated the public school system, followed by the minimum standards movement imposed by the states in the 1960s and 1970s, we have been engaged in heated discussions about educational access and quality in America. That debate continued in the 1980s with the release of the report, “A Nation at Risk: the Imperative for Educational Reform” (1983), and the National Education Goals (1989), both of which raised concern about the quality of P-12 education and, by association, the quality of teaching in America.

During this same period, The Carnegie Corporation issued its report, “A Nation Prepared: Teachers for the 21st Century,” in which it identified the need to more clearly define what we mean by accomplished teaching and how to recognize teachers who demonstrate those attributes. The report linked the quality of teaching to the successful reform of America’s schools. As a result, the Carnegie Corporation created the National Board for Professional Teaching Standards (NBPTS) in order to define highly accomplished teaching and to provide national certification to teachers who exemplify those qualities.

More recently, the issue of teacher quality has become a federal issue as government officials express growing concern about the future of the American workforce. The 2001 Congressional reauthorization of the Elementary and Secondary Education Act (No Child Left Behind, NCLB) catapulted the issue of teaching quality and teacher education to the top of the education reform agenda as a critical factor in improving student learning. The NCLB Act developed its own definition of what it means to be a highly qualified teacher in the core subject areas and mandated states to use its criteria in defining highly qualified teachers.

And just last year, Congress called for a study of teacher preparation programs, to be conducted by the National Research Council (NRC), the principal operating agency of the National Academies of Sciences and Engineering in Washington, DC (U.S. Department of Education, 2002). The NRC was asked to assess the state of the nation’s teacher preparation programs and publicly report its findings in 2007. Specifically, the NRC must synthesize data and conduct research on the academic preparation and
educational characteristics of candidates in pre-service, graduate, and alternative certification programs; the specific content and experiences that are provided to candidates for degrees and alternative certification in education; the consistency of the required course work and experiences in reading and mathematics across teacher preparation programs; and the degree to which the content and experiences are based on converging scientific evidence.

I can only presume that Congress commissioned this study because it believes, as do I, that the key to America’s future health and well-being is education. In order for America to be able to grow and thrive in today’s global society, it must rethink the way it educates and prepares its citizens—from pre-kindergarten through graduate school and beyond. From an economic standpoint, Americans today are competing for jobs with people from around the world and, therefore, in order to be successful, require an education that will better prepare them for a complex, more culturally-diverse environment. Further, the increased mobility of knowledge and capital, along with lower wages in many other countries, erodes the United States’ ability to keep industry and jobs on its own soil. Lockheed Martin Chief Executive Norman Augustine recently observed, “In the five decades since I’ve been working in the aerospace industry, I have never seen American business and academic leaders as concerned about this nation’s future prosperity as they are today” (The Washington Post, December 6, 2005). Augustine further argues that to address this issue, the United States must focus more on fundamentals such as recruiting more teachers, providing them with more financial support, and improving the skills of teachers through enhanced education and preparation.

The complexity of our education system and the nuances of what the future will bring mean that we need to be willing to change the education paradigm to more effectively prepare our graduates to be educationally and, thus, economically competitive. In other words, we need to address the inadequacies of our classrooms as well as the philosophy, practices and politics of teaching and learning. As a global pace-setter, the United States’ commitment to better-educating its citizenry will not only benefit its own future but will influence the educational and economic transformation of other countries. A century ago, America adapted its education system to the needs of a newly industrialized nation. The system must now evolve again, to reflect explosive growth in technology and communications, increased access to information and rapidly changing demographics. By commissioning the NRC study, Congress has acknowledged the vital role of schools of education in ensuring that the United States remains one of the most socially, economically and politically advanced countries in the world.

How can schools of education better prepare twenty-first-century teachers, counselors and administrators (hereafter referred to as teachers) to more fully equip citizens for the global society in which we live? Much has been written on this topic by organizations like the NBPTS, The Interstate New Teacher Assessment and Support Consortium (INTASC), the National Commission on Teaching and America’s Future (NCTAF), the National Council for the Accreditation of Teacher Education (NCATE) and other groups. Two main themes are stressed.

First, today’s teacher must be prepared for the increasingly diverse U.S. classroom and be committed to educating all children, especially those who have traditionally struggled to meet high academic standards—the economically disadvantaged, minorities and those for whom English is not the first language—and must recognize that all students are integral to America’s future.

Second, in order to ensure that each student is prepared to succeed, teachers should be able to teach in ways that promote deep understanding of the subject matter and have a repertoire of pedagogical strategies that addresses the needs of different learners. They
must be able to design a curriculum that is aligned with what students are expected to learn, as defined by state and national standards, and, as part of our global learning community, they must know how to use data to assess and then adapt lessons so that all students have an opportunity to achieve at higher levels.

Thus, a key question is whether we are preparing educators, especially teachers, for the knowledge-based, global society in which we now live, or whether we are still preparing them for the industrial era that is long past? The model of schools as cubicles—in which teachers teach their classes in isolation using the didactic method, or where subjects are taught as though they, too, are isolated disciplines—is no longer the most practical nor effective way to teach and learn. Today, students need to understand the interdisciplinary relationship between, for example, technology, English and biology. Such courses could be taught by teams of teachers using strategies like block scheduling to allow more time for students to develop strong social and academic foundations, and to learn how to learn together. In these environments, students would discover how to ask real world questions and research, synthesize and effectively communicate the answers. Thus, they would have more opportunities to become self-motivated and inquisitive, and to become leaders in their learning environment. Throughout their educational experience and beyond, students will be able to draw upon these valuable skills.

But, some would say our classrooms are actually becoming more didactic and our curricula more narrow in response to an increasing emphasis on standards-based testing. Indeed, this method of learning appears to be on a collision course with mediated and distance learning methodologies, and we, therefore, need to re-examine how we teach standards-based curricula and how the school day is structured to maximize learning. In order to allow more time for students to work in the aforementioned learning communities, schools need to introduce flexible formats that can accommodate integrated learning models, distance learning or other strategies designed to expand and strengthen the depth of their learning experiences. This means that teachers need to know how to use a variety of technologies as part of their repertoire of teaching and learning tools, how to design course offerings that reinforce high standards of learning for the individual student, as well as for the class as a whole, and must be able to teach in teams—either face-to-face or by using, for example, video conferencing.

But, before teachers can do so, schools need to be structured and equipped to ensure that they have the fiscal and physical capacity to accommodate these new learning tools. For example, teachers are expected to prepare students for an information-communications, technological society, yet, in too many schools, the electrical facilities are so outdated that, even if they had the technologies, it would be too dangerous to plug them in. Many schools, colleges and departments of education (SCDEs) also need to be modernized to assure that they, too, have the resources to prepare teachers for the realities of teaching and learning in a knowledge based and diverse society.

We often hear policymakers express concern about America’s teacher shortage (which, I might add, is a worldwide crisis) and the need for teachers to be better qualified. There are more than 3.1 million teachers in the U.S., of which about 50 percent are expected to retire or simply leave by 2015 (National Education Association, 2002). The shortage is expected to be even more dramatic for school administrators and higher education faculty. The shortage is even more acute among educators from minority groups and in communities whose student populations are primarily minority and/or poor. This means that, as America’s student population grows more diverse, the diversity within the teaching profession is diminishing at a time when we need to grow the size and quality as well as enhance diversity within the teaching profession. As we struggle with the issue of the
teacher shortage, we must also address the issue of the teaching paradigm and its effect on our ability to attract and retain highly qualified teachers in our schools.

I believe that we need to redefine the roles and responsibilities of teachers as key players in determining what we mean by quality education, accountability and effective teaching and learning. Communities should build upon the talents, knowledge and skills of their teachers as teachers, but also as mentors to teacher interns, curriculum developers, clinical practitioners, staff development providers, peer coaches for their teacher colleagues, researchers and leaders of reforms to improve teaching and learning in their schools (Futrell, 2004). Such distributive leadership can strengthen teaching, the school environment and the profession itself. Teacher educators, therefore, should prepare teachers for these differentiated, integral roles rather than continue year after year the paradigm of teaching as an isolated discipline. These are roles and responsibilities that I believe will enhance the learning community and teaching as a profession.

Before entering the classroom, future teachers must fully demonstrate mastery of their content area and pedagogical skills through well-mentored, diverse field experiences. Teacher candidates at The George Washington University, for example, are required to intern in two different settings, at least one of them urban, for a minimum of two semesters while being supervised and evaluated by faculty and veteran teachers. Through partnerships with eleven school districts—rural, suburban and urban—our students are exposed to a variety of experiences that enrich and strengthen their teaching and leadership expertise even before they graduate.

Once novice teachers are in the classroom, veteran teachers, administrators and teacher educators should work together to help keep them there. Attrition, particularly in urban school districts where the need for highly qualified teachers is the greatest, is a major contributor to America’s teacher shortage. Schools should work with school districts to create induction programs that more effectively mentor and retain new teachers. For example, novice teachers should not enter the profession through the traditional “baptism by fire” method in which they are assigned to teach the toughest classes with little, if any, support or mentoring. Rather, novice teachers should be inducted into the profession and the classroom over a period of one to three years through programs that are carefully designed and staffed by accomplished teachers who help them gain the self-confidence and the expertise they will need to become successful teachers.

This brings me back to the point of teacher educators and their capacity to help the United States maintain its leadership role in the world. Studies have repeatedly shown that teacher quality is one of the most important factors influencing educational success (Sanders & Rivers, 1996). Studies have also shown that the quality of preparation and support teachers receive will determine their effectiveness in the classroom, the confidence they have in themselves as teachers and whether or not they will remain in the profession (Alliance for Excellent Education, 2002; Lieberman & Miller, 1999; NCTAF, 2003; Southeast Center for Teaching Quality, 2003). The same logic applies to teacher preparation programs: we need to ensure that teacher educators have the institutional support to successfully recruit and prepare candidates who are highly qualified and committed to teaching as a profession. We also need to more clearly define and support the scholarship of teaching and learning, including field experiences and other forms of engagement.

Yet, in too many instances, despite the increasing national demand for more and better prepared teachers, SCDEs remain low on the higher education hierarchy. The institutional commitment to strengthening teacher preparation programs is weak, which is ironic because the quality of teacher preparation programs is a major determinant of the quality of the teaching force, which, in turn, affects the quality of the high school
graduates who will become the students attending these very same higher education institutions. Colleges and universities seem more willing to pay billions of dollars for remediation programs for students rather than invest in programs that enhance faculty development, improve teacher preparation and provide sophisticated teaching tools and environments on par with those their graduates will be required to use when they enter their chosen profession. And, as we induct teacher educators into the professoriate, we should consider the implications of the emerging societal challenges, the changing roles of faculty and what their priorities should be as they prepare tomorrow’s teachers, counselors, and school administrators.

The process of education reform is very complex, but it continues to evolve steadily. Schools, colleges and departments of education, especially teacher preparation programs, must maintain and improve ongoing efforts to redesign the teaching-learning paradigm to more effectively ensure that American citizens are well-educated and well-prepared for our global society. As part of the changing environmental context, we should celebrate our achievements, but also recognize that if we are to achieve the goal of a better educated America, we, too, must change, and we must have the institutional support to help us do so. As Wynn Calder, associate director of University Leaders for a Sustainable Future, said, the future calls on us to “. . . look forward . . ., to envision what we hope to achieve, and to create a strategy for getting there” (UNESCO Education Today Newsletter, 2006, p. 3).

The ability of teacher educators to successfully fulfill our mission of preparing highly qualified teachers will be a key factor in determining how we, the United States, as a nation respond to challenges facing us now and in the future, whether they are educational, political or economic. Citizens will need to understand the interrelated nature of those challenges and have the knowledge, diverse skills and leadership abilities to work together in order to address them. Our success also will be contingent upon how committed, determined and successful we are in redefining the philosophical, political and practical paradigm of teaching as a profession, from pre-school through graduate school. Teacher educators have played and will continue to play a key role in ensuring that Americans are educationally prepared to help sustain and strengthen the foundations of our nation’s democracy in a global society.

Calder, Wynn (March 16, 2006) quoted in Educating for tomorrow’s world. UNESCO Education Today Newsletter, p. 3. Paris, France; UNESCO.
National Education Association (2002) Attracting and keeping quality teachers (pp. 1–2) http://www2.nea.org/teachershortage/
“Why do you want to be a teacher?” When I first decided to pursue a career in teaching, I heard that question many times. My answer was always the same: “I love learning and I want to share my passion with others.” My family instilled that passion in me, and the teachers I was fortunate to have throughout my schooling shaped my vision of “good” teachers. Good teachers had great power—to inspire students to strive for success, to make ideas come alive in the classroom, and to respond to a wide range of student needs. My love of learning, combined with this favorable view of the teaching profession, influenced my decision to become a teacher. Despite my passion for the profession, I had not always considered teaching as a career. I graduated from a highly rigorous and prestigious university with a degree in psychology. It was not until my junior year that my love for teachers, children, and learning came back to me, and I decided to become a teacher.

Soon after I applied to graduate school for education, the questions began. I received mixed responses—some from my former teachers—ranging from surprise, to support, to flat-out discouragement. Many wondered why I would graduate from one of the nation’s top universities and choose “just to be a teacher.” The prevailing sentiment was that students who were successful in school, and could do “anything they wanted” should not settle for teaching as a career. To me, this seemed counterintuitive. Wouldn’t any profession—especially one charged with educating the next generation, need and want to attract men and women with strong educational backgrounds?

Teaching is referred to as a “profession” or a “career.” However, it is not held with the same regard as traditional professions, such as medicine, law or business. A reason for this is historically, teaching has been a “female” career. Women, who were barred from many other types of work, generally chose to be teachers. Since “teaching was largely a short-term career chosen by men on their way to another line of work and women who taught until they married or had children” (Johnson & Kardos, framing chapter in this section), wages were not comparable to other professions. Male teachers would move on to more lucrative careers, and after a woman got married, her husband would provide for her, eliminating the need to increase teacher salaries. Times have changed, and women now have a multitude of opportunities. They do not have to choose between a career and family. However, since women still make up the majority of the teaching force, many perceptions of teaching have not changed.

These perceptions have a major impact on who does or does not choose to teach. Teaching faces many hurdles in the twenty-first century. It does not pay a salary comparable to other professions which require specialized skills and knowledge. This, combined with the challenges of being a teacher today (high percentage of non-native English speaking students, youth violence and poverty, standardized testing, scripted curricula,
increased pressure, and decreased autonomy), speaks to why teaching must strive to change the “status quo” if it is to recruit a workforce comprised of individuals from diverse backgrounds and experiences. All U.S. schoolchildren deserve and require teachers who represent the diversity and cultural richness of our nation. The composition of the mostly white, female teaching workforce does not match the increasingly diverse student body in the United States. If our young people are to develop an appreciation and understanding of people from all walks of life, they must be exposed to a variety of experiences and people. Having a teaching workforce that more closely matches the students we serve increases the probability that we meet the social, emotional, and academic needs of all children and provide all children with a deep, rich education. While some critics contend that demographic diversity among teachers does not correlate with better test scores, the fact remains that students and the public at large need to see that knowledge belongs to all people, and that is best demonstrated through an economically and culturally diverse workforce. Thus, teaching needs to attract and retain teachers of color, male teachers, and candidates from the top of their graduating classes—individuals who normally do not consider teaching.

Teaching is an intellectual profession—and teachers are intellectuals. Accomplished teachers know how to effectively manage classrooms of upwards of 20 unique learners. Teachers are not only responsible for teaching factual knowledge, but must facilitate students’ acquisition of essential higher-order, analytical skills. Teachers must merge in-depth knowledge of the state/district curriculum with numerous other resources to deliver the content and skills students need to know in a developmentally appropriate way. Students are children, and children have interests, concerns, and emotions. A teacher must take in a multitude of inputs that include but are not limited to academic information, and make decisions to tailor their lessons to each child they teach. For example, these are some questions I have asked myself during one day of teaching: “Did Anita have breakfast this morning? Did Carmen fight with a friend? How will David’s parents’ divorce affect his motivation? How do I engage Jake in science? Are my materials provisioned correctly? Who needs to work on long division in a small group? Does Amjad miss his friends back in Bangladesh? Is Joey still worried about the gunshots he heard last night?”

If teaching continues to attract only a narrow slice of graduates, the status of the profession will remain what it is today—below that of other professions that require a similar level of intellect, resolve, creativity, and preparation. It is essential that teachers possess a certain level of intellect so that they are able to process information quickly and make instructional decisions based on their understanding of how essential skills are applied in a variety of settings. For example, a teacher who simply shows students how to conduct a science experiment is not as accomplished as one who leads students to a deeper understanding of the nature of inquiry. However, this intellect is not comprised solely of verbal ability and the teacher’s college GPA. While the teacher’s academic preparation is, of course, an asset to the students he or she teaches, a teacher must also have the ability to understand children, determine the vital concepts and skills they need to acquire, and construct a lesson sequence which engages students in meaningful experiences, leading them to discovery of said skills and concepts. While student-teaching first grade, I definitely possessed a high level of verbal ability and had a strong academic background. However, it took weeks of teaching, observation, and collaboration with my cooperating teacher and university advisor to effectively engage my first graders in instruction crafted to their unique strengths and needs. In addition, a teacher is a model of a learned person, someone who is passionate about knowledge and provides students with opportunities to see the world beyond the classroom, and beyond their
neighborhoods. A teacher is a scholar who, through personal rapport with students, can inspire them to set and achieve high goals. If the composition of the teaching profession were to more closely match the racial and ethnic demographics of students, as stated earlier, then there would be teachers providing students from all walks of life an authentic role model of an educated person.

The question remains as to how to attract and retain a wider range of individuals to the profession. In large part the answer is money. Our society equates money with status and prestige. If teaching wants to attract candidates on par with those considering medicine, law, business, and engineering careers, salaries must be competitive. The notions that teaching is “noble” and that “teachers don’t go into it for the money” are limiting to the profession, and propagate other common sayings, such as “those who can’t do, teach.” As Lortie states, “historically [teachers’] status has been defined as underrewarded . . . the emphasis on service, on teachers as ‘dedicated,’ is a more potent source of inhibition, since many people both inside and outside teaching believe that teachers are not supposed to consider money, prestige and security as major inducements” (1975, p. 30).

In the twenty-first century, employees perceive work differently than they did thirty years ago. According to Johnson and Kardos (this section), “the average American thirty-two year old has worked for nine firms.” I have worked with many accomplished teachers who have left their schools or even the profession because of low pay, high-stress and a stifling work environment. The creativity of teaching often takes a back seat to constant preparation for high-stakes tests, especially at low-income schools, increasing teacher “burn-out.” Other factors in addition to salary come into play when attracting and retaining accomplished teachers. Schools must be structured in a way that teachers’ expertise and intellect are utilized. Exceptional teachers must be rewarded and recognized for their accomplishments. If graduates perceive teaching as a profession in which they will be able to sustain a comfortable lifestyle and one in which they will enjoy autonomy and opportunity for professional advancement, they are more likely to choose teaching as a career.

In its 2002 annual report on teacher quality, the U.S. Department of Education states that, “the best available research shows that solid verbal ability and content knowledge are what matters most” (U.S. Department of Education, 2002, p. 18). However, teaching and learning are highly complex and therefore difficult to quantify; the absence of data to expand definitions of teacher quality beyond content knowledge (as measured by GPA or test scores) does not mean that teacher quality does not encompass numerous characteristics and skills. Teaching is an intricate act involving a range of skills—from seemingly routine tasks such as constructing seating charts and calculating grades, to making countless split second decisions based on student needs, planning instruction and assessment, and playing the role of psychologist, parent, mentor and disciplinarian (sometimes simultaneously!). These skills are not innate, or solely intuitive. They are skills that the teacher must learn prior to entering the classroom, and in the years of practice that follow.

While it is obvious to teachers, parents, and students that a good teacher possesses many qualities, there are many others who seek to distill “good teaching” into a simple formula. This simply cannot be done. Quantifying the science and art of teaching shortchanges it. There is more to being a good teacher than content knowledge and verbal ability. Teacher preparation programs do and must continue to emphasize teachers’ ability to work with young people effectively. Thus, teacher candidates graduating from teacher preparation programs must be deemed knowledgeable in their subject area, as well as in their ability to relate to the students they teach, to engage them in meaningful instruction, and to use assessments to inform appropriate instruction. I do not believe that content knowledge should be disregarded—broad content knowledge and academic
ability are essential aspects of accomplished teaching. However, they constitute only one part. When readiness to teach is indicated by a passing score on a simple standardized (often multiple choice) exam, we are afforded only a snapshot of a candidate’s abilities (Goodwin & Oyler, this section). A single test score cannot reveal how “good” of a teacher she or he will be. Thus, evaluation of a student teacher’s interaction with students should take a greater role. A teacher ill-prepared in managing a classroom of diverse learners with multiple needs will most likely leave the profession in frustration. In addition, highly able teachers will (and do) leave the profession if not given a chance to use their professional teaching knowledge to affect and inform educational change.

Two major aspects of my teaching career thus far have made my experience as a classroom practitioner a rewarding and fulfilling one. The first is the school in which I have worked for the last seven years. The second is achieving National Board Certification. I hope that by sharing my experiences, I can provide clear examples of how teaching can draw top candidates, retain talent and elevate the status of the profession in the eyes of the public.

Too often, promising young teachers leave teaching due to increased pressure from standardized tests, “teacher proof” curricula, and top-down mandates which hardly seem to relate to children at all. Research shows that it is often the best teachers who leave (Johnson & Kardos, this section). The pressures of state and government mandates (and resultant teacher turn-over) more acutely affect low-income schools, leaving the poorest children with the least experienced teachers. I teach fourth and fifth grade at a school outside of Washington, D.C. The student population is greatly impacted by poverty. About 90 percent of our students are eligible for Free and Reduced Meals (FARMS), which is an indicator of poverty, and 40 percent of the students receive “English for Speakers of Other Languages” (ESOL) services. Our mobility rate is high—over a third of our students change during the course of a year. Five years ago, only 13 percent of third graders scored at a proficient level on the Maryland state assessments, and only 5 percent were proficient in math. A large part of our student population is made up of brand-new immigrants from all over the globe. We face many challenges besides low test scores: adult illiteracy, neighborhood gang violence, students affected deeply by the war-torn homelands they left, students and parents’ beliefs that intelligence and academic success are innate, and of course, poverty. Communicating expectations of a U.S. school to parents who are unfamiliar with the role they play in their children’s education is also a challenge we face. Our students often lack the background knowledge that is taken for granted in middle-class schools. However, they do have rich cultural backgrounds and stories of their own. Unfortunately, standardized tests do not always take these experiences into account.

Due to our low test scores, the state threatened to reconstitute the school and hire an entirely new administration and staff. However, through a unique partnership between the teachers’ union and the school district, a teacher-led restructuring program began in 2001. The principal stayed, and teachers were given a choice to leave or stay. Twelve first-year teachers were hired that year. All teachers made a three year commitment to our school. We were required to work (and were compensated for) the equivalent of 15 extra days collaborating with colleagues, planning instruction, and analyzing student work. The focus of every decision was doing what’s best for children. With support from administration, the union, and the school district, teachers became “teacher-leaders.” Teachers were given a voice in the operations and structure of the school and the education it provided for students. For example, two years after the initial restructuring, the teaching and instructional support staff voted to departmentalize. Collectively, we felt
stretched thin, and chose departmentalization as an alternative structure that would benefit students, because teachers would be able to specialize in two content areas (math/science or literacy/social studies). We decided to structure our planning time to allow us to work in vertical (Pre K-5) teams as well as with our grade level content team (e.g. fourth grade math/science teachers). Staff also designed and implemented sessions on examining student work or studying professional books, and developed committees that focused on meeting the social/emotional needs of students, recognizing and instructing gifted-talented students, and initiating parent/community outreach. Everything we chose to do as a staff had a purpose—to positively impact our students’ learning and their lives as a whole.

Over the next five years, test scores improved dramatically, increasing to 75 percent of third graders proficient in reading and 67 percent of third graders proficient in math. Test scores weren’t the only improvement. Students and parents alike became accustomed to the school philosophy—that all children can learn, given enough time and support. Students began seeing the value of effort and its correlation with achievement. Our school’s “4 Key Messages” include, “Effective effort and strategies will lead to success.” The culture of the school is one of academic rigor and respect for students’ cultural backgrounds and the knowledge they bring to the classroom. I believe that the reason our school continues to succeed in educating our students is because teachers, instructional assistants, administration—even the cafeteria and custodial staff—are all accountable to each other and to themselves. Though the restructuring was initially driven by low test scores, the ownership of the process by staff has enabled our school to create professional accountability—not the kind that teachers shudder at the thought of (sanctions, penalties, programs imposed by outside agencies), but the kind that demands that everyone in the building takes responsibility for educating children, the kind which attracts and retains strong, accomplished teachers by giving them a voice in the way their school works. In the process of reforming our school, ten teachers achieved National Board Certification. We currently have five National Board Certified Teachers, including the 2006 National Teacher of the Year. Five additional teachers are currently pursuing National Board Certification.

In addition to strong, teacher-led schools, the profession needs to support teachers’ continual quest for knowledge and passion for learning. If we are to attract and retain lifelong learners to teaching, then we must allow teachers an opportunity to break out of the traditional salary lane, to advance professionally and intellectually. Sure, teachers love working with children, but this alone is not enough to keep them in the profession. The National Board for Professional Teaching Standards (NBPTS) set forth its Five Core Propositions in 1989 (NBPTS, 2002), articulating a vision of accomplished teaching. NBPTS states that proficient teaching calls for the teacher to have a broad knowledge of the liberal arts and sciences; to know the subjects and skills they teach students; to understand and utilize curriculum materials and assessments; to use a variety of teaching and assessment methods. Teachers must also possess “knowledge of students and human development; skills in effectively teaching students from racially, ethnically, and socio-economically diverse backgrounds; and the skills, capacities and dispositions to employ such knowledge wisely in the interest of students” (NBPTS, 2002, p. 2). The policy statement contends that:

This enumeration suggests the broad base for expertise in teaching but conceals the complexities, uncertainties and dilemmas of the work. The formal knowledge teachers rely on accumulates steadily, yet provides insufficient guidance in many situations. Teaching ultimately requires judgment, improvisation, and conversation
about means and ends. Human qualities, expert knowledge and skill, and professional commitment together compose excellence in this craft.”

(NBPTS, 2002, p. 2)

To achieve National Board Certification, there were many skills I had to demonstrate. As a teacher of upper-elementary students, I had to demonstrate in-depth content knowledge of national standards in literacy, mathematics, science, social studies, health and the arts. However, this was only one part of my certification requirements. In accordance with NBPTS standards, I had to demonstrate knowledge of students’ strengths and needs, monitor student learning, think systematically about my practice, engage parents in two-way communication, and be an active member of a learning community. Research conducted by numerous universities and independent agencies show that students of teachers who meet NBPTS standards improved an average of 7 percent more on their year-end math and reading tests than pupils whose teachers attempted but failed to gain certification. There were even more significant gains (up to 15 percent) with younger and lower-income students. This gain was statistically significant even when controlling for years of experience, degree level and scores on licensing exams (Goldhaber & Anthony, 2005).

So what does this all mean? First, if we, as a nation, are to provide a well-balanced, culturally relevant, cutting-edge education to all children, we must strive to attract and retain diverse, well-prepared, accomplished, vocal teachers. Those who choose to teach come for the kids, but stay because of the intellectual stimulation and ability to truly make a difference (in education as well as children’s lives). Second, all teachers must be empowered to speak out on what we know is good for learners. It is up to those of us working in the profession, and those preparing the next generation of teachers, to ensure that we work towards strengthening our profession by increasing teacher voice in policy-making decisions. It is only by bolstering teachers and teaching through better pay, increased opportunities for advancement, and a greater voice in curricular and policy decisions, that we will attract the highest quality candidates from varied backgrounds and experiences who will commit to teach our nation’s greatest resource: its children.

Does difference make a difference?

Diversity and teacher education

Editor: Ana María Villegas
Part 5
Framing chapters
31 Diversity and teacher education

Ana María Villegas
Montclair State University

The population of the United States has always been characterized by racial, ethnic, and linguistic diversity. While formal histories of the country have given center-stage to Anglo-Saxon English speakers, a large percentage of the populace has always been of other racial, ethnic, and linguistic backgrounds. These groups have included the Native people who were on this continent before Northern Europeans arrived; African people brought here as slaves; Spanish-speaking people (some of European heritage and some mestizos) in what was Northern Mexico before it was appropriated to become the American Southwest; the Chinese men who came to build the railroads; a large influx of European immigrants, mostly from Southern and Eastern Europe, who began arriving in the latter part of the nineteenth century; and more recently, an even larger and more diverse wave of immigrants from all over the world.

The need to unify these varied groups equitably into one political entity has made diversity an enduring and tension-laden issue in the United States. The public schools of this country are said to have a major role in bringing about this unification by providing a “common education” to students from diverse groups. Theoretically, the “great equalizer” of public education offers everyone the knowledge and skills they need for successful integration into American society, regardless of differences in backgrounds. The underlying assumption is that if students work hard in school and prove themselves deserving, they will ultimately reap the benefits of education in their adult lives. Despite these lofty ideals, American society has failed at the task of equitably integrating people of diverse backgrounds—particularly people of color—into its economic, social, and political structures. Neither have schools fulfilled their promise of providing an equitable opportunity for every person to prove his or her merit.

Until slaves were emancipated in 1862, people of African descent living in this country were prohibited by law and/or custom from formal education (Woodson, 1919). After emancipation, public schooling became available to Black children, but they were required to attend segregated schools, particularly in the South, where the overwhelming majority of the Black population lived. The “separate but equal” doctrine notwithstanding, segregated schools were clearly not equal. While the Brown decision of 1954 dismantled the legal basis for a dual system of education in this country, the pre-Brown legacy endures to the present in that many if not most U.S. schools remain largely segregated by race, ethnicity, and social class (Orfield & Lee, 2006). Like African Americans, Native American and Hispanic students have also suffered from a pattern of segregation and inequitable schooling. Such exclusionary practices have resulted in a considerable academic gap between students of color and their White peers over time. This contradiction between the espoused principles of equal educational opportunities on one hand and well-documented disparities in the treatment and educational outcomes of different groups of students on the other hand has framed
discussions of issues related to diversity in American education, particularly during the past 50 years.

Conflicting views of how schools should prepare children and youth from diverse backgrounds for social, economic, and political participation in American society reflect different conceptions of diversity that have coexisted in this country over the years. Historically, cultural and linguistic assimilation has been the prevalent goal of American education. From this perspective, a prime objective of schools is to eradicate cultural and linguistic differences and instill in all children a common set of values—namely, those of the White, Protestant, middle-class, English-speaking dominant group in American society. In its extreme form, this view is reflected in Federal policies of the post-Civil War era that called for Indian children to be removed from their families and enrolled in boarding schools where they were immersed in the language, values, and practical knowledge of the dominant society while being stripped of their traditional language and culture. Assimilationist thinking has also informed public school practices aimed at Americanizing immigrants, whether they came to this country voluntarily or became part of it through colonization or annexation (MacDonald, 2004). Underlying such assimilationist school policies and practices is a deep-seated fear that cultural and linguistic diversity threatens the unity of society. Implicit in this thinking is also the general belief that the language and culture of the dominant group in the United States are inherently superior to the languages and cultures of other groups, especially those of people of color.

Countering the assimilationist position is a pluralistic perspective that has gained some support in the United States over the past four decades. The latter viewpoint contends that diversity is a valuable aspect of U.S. society and the presence of a variety of cultures and languages enriches the nation as a whole. As such, advocates of pluralism encourage the preservation of linguistic and cultural differences, but not the separation of different groups from one another. To the contrary, they believe that respectful interaction and communication across differences is essential for the well-being of all. In its purest form, pluralism embraces the belief that no one group is superior to others and all cultures are equally valuable. From this perspective, a salient goal of schools is to incorporate and respond positively to the diverse ways of knowing, learning, and behaving of different cultural groups. This thinking is manifested in the concept of multicultural education articulated by the American Association of Colleges for Teacher Education (AACTE) in its 1972 position paper entitled No One Model American. Because this position paper has helped define issues of diversity in teacher education since its publication, it is included as an artifact in this section of the Handbook. Interestingly, Glazer (1993) contended that assimilation as an ideal came into disrepute in the late 1960s due to the country’s failure to integrate the Black population into its social and economic structures. Such failure, he argued, was based on racist attitudes and behaviors that have historically prevailed in the U.S. He further contended that the inability to integrate Black Americans equitably brought to surface the problems inherent in assimilationist thinking and lent political support to pluralist views, a shift in perspectives that he thinks resulted in calls for multicultural education. This provocative article is also included in the artifact portion of this section of the Handbook.

DIVERSITY AND TEACHER EDUCATION IN A CHANGING CONTEXT

This section of the Handbook focuses on how teacher education has responded to student diversity, attending specifically to developments of the past 50 years. Among several
key factors that have shaped this response, three merit special attention: (1) changes in the demographic makeup of the K-12 student population; (2) changes resulting from the Brown decision; and (3) changes in conceptions of learning.

**Changes in the demographics of the K-12 student population**

Since the 1970s, the K-12 student population has become increasingly diverse racially and ethnically. In 1971, students of color accounted for 22 percent of enrollments in elementary and secondary public schools. Today they account for over 41 percent of the total K-12 student population (NCES, 2004). It is projected that schools will become even more heterogeneous in the future, with students of color attaining the numerical majority by 2035 (U.S. Department of Education, 2002). Growth is particularly evident among Hispanics, who are already the single largest minority group in the United States, and Asians, who are the fastest growing minority group here. Numerical and proportional gains among these groups signal an increase in the number of young people who speak a language other than English at home, which is already having a significant impact in schools. For example, one in five students attending public schools in the United States today is an English language learner (NCES, 2005). These demographic changes are exerting considerable pressure on programs of teacher education to address issues of racial, ethnic, and linguistic diversity.

**Changes resulting from the Brown decision**

The Brown decision of 1954 also helped to define teacher education over the past half century. While the overall intent of the Brown decision was to provide equal educational opportunities for African Americans, school desegregation significantly changed the role of White teachers in elementary and secondary public schools. In the segregated system, White teachers had taught only White children. After 1954, however, they were also responsible for teaching the children of color assigned to their classes, an undertaking for which most were unprepared. This lack of preparation is evident in numerous studies conducted in racially/ethnically integrated classrooms during the 1960s, 1970s, and 1980s, the results of which showed that White teachers generally held lower expectations for students of color and often treated them less favorably. This sobering realization led to some modification of the teacher education curriculum with the overall goal of preparing White candidates to teach students from diverse backgrounds equitably and effectively. The addition of a multicultural education standard by the National Council for the Accreditation of Teacher Education (NCATE) in 1979 as part of the accreditation process for schools and colleges of education and its revision in 2000 provided support for these changes.

The Brown decision had another unintended consequence. Ironically, school desegregation dramatically reduced the presence of Black teachers in public elementary and secondary schools. Ethridge (1979) conservatively estimated that by 1970 at least 38,000 Black educators who had staffed Black schools prior to Brown lost their jobs through dismissal or non-renewal of contracts. According to Irvine (1988), the massive loss of Black teachers severed the cultural links between home and school that had existed for African American students prior to desegregation. Since the late 1980s, programs of teacher education have been pressed to recruit and prepare more people of color for the profession. (The Ethridge article is included as a section artifact to give insight into the historical roots of the existing shortage of teachers of color.)
Changing conceptions of learning

Changing conceptions of learning over the past three decades—from transmission to constructivist views—also have profound implications for the teaching of diverse student populations. Historically, transmission views of learning have guided the work of teachers and schools. Within a transmission framework, the role of students is largely that of “receiving” the knowledge comprising the curriculum. From this perspective, learning is viewed as the consumption, storage, and recall of information by individual students. The prevalent image of the learner is that of a receptacle or container waiting passively to be filled with knowledge. Accordingly, teaching involves transmitting the content of the curriculum to students. Because it is assumed that all students (should) learn the same way and that their background experiences play no appreciable role in learning, teachers are thought to need only knowledge of their subject matter and a uniform method of instruction.

Since the 1960s, transmission views of learning have been challenged by critics who argue that what is learned is always filtered through the learner’s frame of reference. From this interpretive perspective, learning is defined as the process by which students construct meaning in response to new ideas and experiences. In so doing, learners are said to use their prior knowledge and beliefs—which they have stored in memory as mental structures (described variously by cognitive scientists as knowledge frameworks, schemata, or personal theories)—to make sense of the new input (von Glaserfeld, 1995). Good teaching, therefore, involves helping students build bridges between their prior knowledge and experiences—both personal and cultural—and the material to be learned. This requires that in addition to knowing their subject matter, teachers need to know their students well in order to help them build these bridges. They also need to be able to use a variety of pedagogical strategies to involve students of diverse backgrounds in learning.

By acknowledging that children’s pre-existing knowledge and experiences—both personal and cultural—serve as the foundation for learning, constructivists position student diversity in a positive light. As constructivist views gain acceptance, teacher educators are necessarily pressed to question the pervasive belief that the language and culture of children who are different from the dominant mainstream group are problems to be remedied. Similarly, teacher educators are finding that they must address the deficit attitudes toward diversity that many White pre-service teachers have derived from a lifetime of socialization in a racist and mostly segregated society.

The aforementioned changes in the demographics of schools, in educational policies and practices resulting from the Brown decision, and in conceptions of learning inform the content addressed throughout the Diversity section of the Handbook.

ORGANIZATION OF THE SECTION

The section opens with three distinct but complementary framing chapters, each of which addresses issues of diversity in teacher education from a different angle. The chapters were conceptualized not only to provide much-needed updates on relevant issues, but also to make conceptually and practically important distinctions that tend to be obscured in the literature on preparing teachers for diversity. Because White teacher candidates and candidates of color enter teacher education programs with substantially different understandings of matters of diversity based on their life experiences, their preparation needs can differ dramatically. Unfortunately, most of the existing literature ignores such
differences. Since the vast majority of teacher candidates are White, most of the literature on the preparation of teachers to teach students of color focuses on the needs of White teachers—often without making that focus explicit. The section tackles this conceptual confusion by purposefully including separate chapters on the preparation of White teachers and on the preparation of teachers of color. This strategy enabled the authors of the two chapters to provide greater conceptual clarity regarding specific preparation issues of relevance to the particular population of teachers on which they focused their analysis. Similarly, the preparation of teachers to teach English language learners (ELLs) has tended to be subsumed under general discussions of teacher preparation for diversity or of preparing culturally responsive teachers. Teacher educators have had almost nowhere to turn to in the literature to learn about the language-related knowledge, skills, and dispositions classroom teachers need to teach ELLs successfully or to learn about ways to help preservice and inservice teachers develop in these areas. The third framing chapter in the section makes a major contribution to the field of teacher education by explicitly distinguishing linguistic diversity from other types of diversity and in examining the preparation of all teachers to teach linguistically diverse student populations.

In the following chapter, Christine Sleeter offers a detailed and thoughtful analysis of the preparation of White teachers for diverse students. Drawing on the available research, she makes a convincing case that preparing White educators for diverse student populations involves much more than equipping otherwise culturally neutral and unbiased candidates with pedagogical knowledge and skills. The chapter presents a comprehensive research-based framework that can assist teacher educators in rethinking the preparation of White teachers for diverse students from the preservice level through the initial year of teaching. The framework gives detailed attention to cross-cultural community-based learning and to coursework and preparation in classrooms, while promoting a coherent approach to teacher education. In addition to its unique and explicit focus on White teachers, Sleeter’s chapter is distinct from previous reviews of the literature on preparing teachers for diversity in its developmental conceptualization of the process for learning to teach from preservice preparation through the inservice years. The chapter offers implications for research and sketches recommendations for teacher education practice that are warranted by the existing research base.

In the next chapter, Villegas and Davis shift the focus of analysis from the preparation of White candidates for teaching diverse students to the recruitment, preparation, and retention of candidates of color for the teaching profession. Situating policies and practices aimed at diversifying the teaching force within the context of the racial/ethnic achievement gap, the chapter offers the most up-to-date review of a relatively small but expanding body of empirical studies that examine the relationship between teacher race/ethnicity and student learning. Based on this review, Villegas and Davis conclude that increasing the diversity in the ranks of teachers has the potential for changing the dynamics of classrooms and schools, and ultimately for improving the academic outcomes of students of color. The chapter also chronicles the shortage of teachers of color from 1971 to the present, explores the reasons for their short supply, and details policy and programmatic initiatives implemented since the early 1990s to remedy the problem. The authors present evidence that minority recruitment policies and programs in the past decade have succeeded in increasing the percentages of Hispanic and Asian teachers, but not the percentage of African American teachers. They warn, however, that while issues of minority recruitment into teacher education and teaching continue to attract the attention of educators, policymakers and researchers, relatively little is being done to prepare these recruits to use their insiders’ knowledge about the experiences of students from racial/ethnic minority groups in their own teaching and to retain them in the profession.
As mentioned above, the final framing chapter breaks new ground in its focus on the preparation of regular classroom teachers to teach ELLs, a topic addressed only superficially—if at all—in previously published reviews of the literature on preparing teachers for diversity. In this chapter, Lucas and Grinberg address three fundamental questions. Why should we devote attention to preparing all teachers to teach ELLs? What do classroom teachers need to know and be able to do to teach ELLs well? What do we know about how classroom teachers are currently being prepared to teach ELLs? The authors draw on empirical, theoretical, and descriptive literature to answer each of these questions. The chapter makes a case for the preparation of all teachers to teach ELLs; provides frameworks for thinking about the content, structures, and processes of such preparation; and gives much needed examples of initiatives that provide such preparation in pre-service and in-service contexts. They also make recommendations for sorely needed research.

The framing chapters are followed by four artifacts (previously published works) that were carefully selected to help the reader understand better how the conflict between assimilationist and pluralist ideologies has played out over time in American society in general and in its schools in particular. Two of the pieces are scholarly articles and two are position statements by the American Association of Colleges for Teacher Education. The first artifact is a 1993 article by Nathan Glazer, an influential sociologist who has written extensively on issues of immigration, multiculturalism, and social policy. As mentioned above, Glazer argues in this article that assimilation as an ideal for immigrants and minorities in the United States fell into disrepute in the late 1960s as a result of the country’s inability to assimilate Black Americans because of deep-rooted prejudices and discrimination against this group. The article illustrates the profound tension between the forces of assimilation and pluralism, particularly as they confronted each other in the United States during the twentieth century. Glazer concludes that multicultural education is a compelling option for Black Americans, given the group’s long history of cultural and structural exclusion.

The second article in this group was written in 1979 by Samuel Ethridge, a prominent official at the National Education Association (NEA) in the 1960s and 1970s who was recently recognized by the NEA for his work to desegregate teacher organizations in this country. By painstakingly documenting the loss of numerous Black educators through dismissals and non-renewal of contracts following the 1954 Brown decision, Ethridge provides insight into the profound racial prejudices that exist in this country. He also sheds light on the historical roots of the current shortage of teachers of color, especially Black teachers.

The last two artifacts—both policy statements endorsed by AACTE—focus directly on issues of diversity in teacher education. In its No One Model American statement of 1972, AACTE concisely articulated the pluralistic perspective discussed above and its implications for teacher education, explicitly rejecting both assimilation and separatism as educational goals. This was a groundbreaking statement at a time when assimilation was still widely embraced. Thirty years later, AACTE published Educators’ Preparation for Cultural and Linguistic Diversity: A Call to Action. In this more recent position paper, AACTE once again rejected assimilation and articulated support for both linguistic and cultural pluralism. The 2002 statement is as bold as the earlier one in its explicit “call to action” for teacher education institutions to strive for educational equity for English language learners in U.S. schools by supporting such measures as native language development and “mutual accommodation” of native and mainstream U.S. cultures. The focus on culturally and linguistically diverse students in 2002 reflects the demographic changes over the previous 30 years—particularly the increased presence of students who speak languages other than English at home.
The section ends with three commentaries written by individuals positioned differently in terms of their cultural, linguistic, and professional backgrounds. In their thoughtful commentaries, the authors explore a broad range of implications for research, policy, and practice that flow from the literature reviewed in the framing chapters. In the first commentary, Jacqueline Jordan Irvine draws on her broad and rich experience as a scholar and researcher with a substantial body of work focusing on matters of diversity. Irvine offers insightful observations regarding the tensions surrounding issues of diversity in teacher education as related to people, pedagogy, and politics. The theme threaded throughout her commentary is that advocates of multicultural education must accept that efforts to integrate diversity into teacher education inevitably involve conflict.

In the second commentary, Tina Jacobowitz and Nicholas Michelli make use of their extensive work with the National Network for Educational Renewal and the Agenda for Education in a Democracy, both of which are based on the work of John Goodlad, to frame their observations. They contend that teacher educators—broadly defined to include faculty in education, in the arts and sciences, and in elementary and secondary schools—need to work together in order to prepare future teachers to address the achievement gap. They argue that such work involves the simultaneous renewal of K-12 schools and teacher education. Jacobowitz and Michelli also offer insightful comments about the purposes of public education in a democracy and the appropriateness of focusing on candidates’ dispositions in programs of teacher education.

In the final commentary, Victoria Chou and Karen Sakash respond to key ideas presented in the framing chapters from the perspective of teacher educators at a land-grant institution with an explicit commitment to serve an urban environment. After illustrating their points clearly with examples from their own practice, they conclude that teacher educators must break with tradition to prepare teacher candidates to ground their teaching in the language and culture of their future students.

Taken together, the works in this section provide rich complementary perspectives on how to prepare teachers for a diverse student population. The changing demographics of elementary and secondary schools coupled with persistent racial/ethnic achievement gaps demand fundamental changes in the ways teachers are prepared. While the goal of providing all children, regardless of backgrounds, with an equal opportunity to learn and ultimately to become active participants in a democratic society has endured across time, approaches to this overarching goal must be adapted to suit the historical moment. The framing chapters offer distinctly new ways of looking at the issues as well as helpful suggestions regarding the types of changes needed today to prepare teachers who have the knowledge, skills, and commitment to educate students of diverse racial, ethnic, cultural and linguistic backgrounds. The artifacts and commentaries help us better understand why such changes are needed.

Preparing White teachers for diverse students

Christine E. Sleeter
California State University Monterey Bay

Beginning in the 1960s, desegregation was intended to make schools more equitable and responsive to communities of color. I will not review the extent to which this intention was actually fulfilled, but will focus on one result: problems associated with the Whitening of the teaching force. In the wake of desegregation, because Whites perceived Black schools and teachers as inferior, numerous Black schools were closed and almost 40,000 Black teachers and administrators lost their positions (Milner & Howard, 2004). Currently less than 16 percent of the teaching force is of color, in contrast to about 42 percent of public K-12 students (National Center for Education Statistics, 2002). The demographic gap between students and teachers is growing as the student population continues to diversify but the teaching population does not.

This gap matters because it means that students of color—especially Black and Latino students—are much more likely than White students to be taught by teachers who question their academic ability, are uncomfortable around them, or do not know how to teach them well. For example, researchers consistently find teachers to see White and Asian students as more teachable than Black or Latino students, and White teachers to be more likely than teachers of color to hold lower expectations for Black and Latino students (Hauser-Cram et al., 2003; Pang & Sablan, 1998; Warren, 2002). White teachers often have more difficulty forming constructive relationships with students of color, particularly African American students, than with White students. Commonly assuming that African American and Latino parents do not value education, White teachers are much less likely to build relationships with them than are teachers of color. Lacking familiarity with communities their students of color come from, many White teachers are unable to build bridges between students and curriculum, but then interpret students’ lack of engagement as disinterest in learning, or their academic problems as inability to learn. Due to a combination of low expectations and cultural mismatch, White teachers appear to refer students of color to special education more than do teachers of color. As a result, students of color tend to be overrepresented in special education, while White students—particularly those from affluent backgrounds—overpopulate gifted programs (Harry & Klingner, 2006). White teachers who are ill-equipped to teach students of color, particularly those in low-income communities, often seek jobs elsewhere as soon as they can, leading to high levels of teacher turnover in many urban and poor rural schools.

Empirical research documents that White preservice students commonly bring into teacher education attitudes and experiences that eventually lead to the patterns above. As members of the most segregated and isolated racial category in the U.S. (Orfield & Lee, 2005), most White candidates enter teacher education with very little cross-cultural background, knowledge and experience, although they often bring naive optimism that coexists with unexamined stereotypes taken for granted as truth (Barry & Lechner, 1995;
Four interrelated problems affect teaching if not addressed directly.

First, bringing little awareness or understanding of discrimination, especially racism (Avery & Walker, 1993; McIntyre, 1997; Su, 1996), most White preservice teachers are “dysconscious” of how racism works in schools and society at large, and how it is reproduced daily (King, 1991). They tend to see racism as a problem of interpersonal interactions, which they believe that an open attitude toward others solves. They generally do not see racism as patterned institutionalized structures and processes that allocate social resources differentially based on race and that have long historical roots. For example, White preservice teachers commonly assume that schools are no longer segregated and that everyone has access to the same quality of education. To attempt to understand race, they usually rely on their own family ethnic history with assimilation and upward mobility, assuming that experiences of White ethnics are the same as those of non-Whites. As a result, many characterize calls for culturally relevant teaching, bilingual education, or multicultural education as “whining” or unnecessary demands for “special treatment.”

Second, because they bring virtually no conceptual framework for understanding visible inequalities other than the dominant deficit framework, studies find White preservice teachers generally assume lower expectations for the achievement of students of color than for White students, without seeing this as a manifestation of racism (Marx, 2003; Schultz, et al., 1996). For example, Richman and colleagues (1997) found twenty such students in a small college estimated the grade point average and IQ of African American children lower than that of White children based only on viewing photographs of children. Like White practicing teachers, White preservice teachers generally assume that underachievement of students of color, particularly African American students, is due to their families not valuing education (e.g. Avery & Walker, 1993; Irvine & York, 1993) rather than to factors under control of classroom teachers. Such a deficit view affects a teacher’s willingness to work to figure out how to reach and challenge students of color. It is unlikely that White preservice teachers will act to close achievement gaps without directly confronting deficit views of students of color and their communities.

Third, White preservice teachers are generally ignorant of communities of color, fearing them and fearing discussing race and racism (Martin & Williams-Dixon, 1994). White teachers commonly sidestep fear through colorblindness, claiming, “I don’t see color, I just see children” (McIntyre, 1997; Valli, 1995). Part of this fear has to do with teachers’ perceptions of themselves as good people. For example, Marx (2003) pointed out that, as her White students began to recognize some of their own actions as racist, they were shocked and disappointed in themselves. Many are also afraid of emotions and tensions that accompany discussions of racism (O’Brien, 2004), and fear saying the wrong thing. Even those who grew up in diverse communities have been found to assume they understand other groups much better than they actually do (Powell et al., 2001).

Fear probably makes so many White preservice teachers resistant to examining long-held beliefs (Smith et al., 1997) and hearing people of color talk about racial concerns that can be addressed. Yet, if fear and ignorance are not directly dealt with, White preservice teachers become classroom teachers who are not able to examine racism in their own workplaces, hear what students or parents of color say about teaching and working with them more appropriately, or facilitate conversations about differences with racially diverse students in their own classrooms.

Fourth, White preservice teachers commonly lack awareness of themselves as cultural beings (Schmidt, 1999), assuming that their own beliefs and ways of behaving are “the norm to which others should aspire” (Valli, 1995). In addition, they have usually spent
very little time in cultural communities unfamiliar to them, so have not developed cross-cultural awareness or tools for viewing another community as a cultural site (Barry & Lechner, 1995; Gilbert, 1995; Hlebowitsh & Tellez, 1993; Larke, 1990; Taylor & Sobel, 2001). As long as they see themselves as normal but not cultural, they use their own unexamined frames of reference against which to judge students, students’ families, and their communities. This practice unfortunately reinforces deficit thinking. For example, a teacher who believes that learning behavior involves sitting quietly will not recognize learning behavior in students who are active and noisy, nor accurately differentiate learning behavior from off-task or disruptive behavior.

There is an urgent need to improve substantially White teachers’ preparation for diverse students. While White teachers can learn to teach diverse student populations well, this does not happen automatically. Preparing White teachers is not simply a matter of equipping presumably unbiased individuals with additional skills and strategies to use with diverse populations. If it were that simple, patterns of racial bias and exclusion would not continue to permeate schooling.

This chapter develops a research-based framework for considering programmatically coherent preparation at the preservice level and subsequent support through the first years of teaching. I selected data-based research studies published after 1980 in which the great majority of the preservice or inservice teachers (usually 90 percent or above) were White. I looked particularly for empirical studies examining effects of an intervention or teacher education experience (such as student teaching) on the attitudes, knowledge, or teaching behaviors of White teachers relative to teaching students of color and/or language minority students. None of the studies linked teacher education with student learning in the K-12 classroom. Given the absence of this type of work, I sought studies that demonstrated a connection between teacher education and teacher learning in areas relevant to quality teaching for diverse students (Alton-Lee, 2003; Gay, 2000). Most of the studies were published in refereed journals, although a few were reported in book chapters.

Throughout I will argue that it is not enough to prepare White teachers to teach as well as the average White teacher does currently. Doing so would only perpetuate lower expectations, discomfort, and lack of appropriate pedagogical knowledge. Instead, if we are serious about preparing White teachers who are able to help close the racial achievement gap, we need to prepare them to teach better and more equitably than the average White teacher does currently. I will use research evidence to show that this cannot be done with one course, one field experience, or one student teaching experience. Instead, research suggests that teacher education programs that are coherently organized to develop teaching practices, with supporting attitudes and knowledge, have the potential to enable White teacher candidates to confront and move beyond twenty-odd years of prior socialization, in order to learn to teach diverse students well.

RETHINKING TEACHER PREPARATION

Teacher education faces the challenge of preparing teachers who will become better than established teachers at confronting and transcending patterns of racism in schools. Teacher education must be powerful enough to counter at least three forms of on-going socialization that White teachers, both preservice and inservice, experience. First, the on-going lived experiences of White people usually take place in relatively homogeneous neighborhoods, in which White individuals associate mainly with other White people, experiencing the everyday privileges that accrue to looking White without being aware of
this (Sleeter, 1992). In this context, not only does cross-cultural and cross-racial awareness not come naturally, but White people often have so little awareness of the experiences of people unlike themselves that they generally deny what people of color say about their own experiences, aspirations, and communities. Second, the ongoing experience of school and classroom life, first as a K-12 student, then as a university student, and subsequently as a new teacher, solidifies taken-for-granted conceptions of how schooling should go and what teaching should look like, making it difficult to envision alternatives (Lortie, 1975). Third, the everyday conditions of teacher work generally structure teaching as transmission of prescribed content to crowds of students following a “banking” model of teaching and learning. When teaching is experienced this way and supported by testing, teachers learn to see differences among students primarily as differences in ability to learn what is prescribed (Prawat, 1992).

Most teacher education programs lack a coherent and sustained approach to countering these on-going forms of socialization. Case studies have found programs in predominantly White institutions to provide disjointed preparation for diversity and equity, dependent on the interests of individual professors rather than on a comprehensive conception of preparation for excellent teaching in racially diverse contexts. Some topics recur in several classes (such as textbook bias), while others are not addressed at all. Student teachers may develop a superficial understanding of multicultural teaching, but in the classroom follow the lead of their cooperating teachers (Cannella & Reiff, 1994; Davis, 1995; Grant & Koskela, 1986; Miller et al., 1997). Many student teachers from such programs have been found to flounder if placed in classrooms in which most students are culturally or linguistically different from themselves (Birrell, 1994; Goodwin, 1994; Weiner, 1990).

There is evidence that well-planned, coherent programs can make an impact that persists beyond preservice preparation. By coherence, I mean two related things. First, the faculty and cooperating teachers who work with preservice students share norms and a vision regarding the purpose of education, the nature of teaching and learning, and the nature and value of equity and diversity. Second, this vision guides planning a teacher preparation curriculum and set of experiences that intentionally build preservice students’ conceptual foundation and pedagogical skill. Ideally, everyone who works with preservice students—including arts and sciences faculty, university administrators who support teacher preparation programs, and teachers and administrators in partner schools—would share the same vision and orient their work toward it. In practice, it is difficult enough to get the teacher education faculty and a core of cooperating teachers to agree on a shared vision and to plan a program together. But doing even that much matters.

Two comparative studies examined program capacity to produce teachers with a constructivist, socio-cultural approach to teaching and learning, demonstrating the power of program coherence. Tattoo (1998), in a comparison of nine teacher education programs (five preservice, one induction, one alternate route, and two inservice), found that those with the most internal coherence most strongly guided the development of teachers’ beliefs. Internal coherence meant that faculty shared a defined philosophy and norms, used those to guide curriculum development and implementation, and provided students with context-relevant opportunities to learn. Brouwer and Korthagen (2005), in a longitudinal study of graduates of four teacher education programs, found programs with an impact that was visible in teachers’ second and third years of teaching were the most coherently planned. Cooperating teachers and field supervisors developed a shared vision of classroom teaching. Classroom field experiences introduced preservice teachers gradually to increasingly complex teaching, and programs alternated intentionally between
field experiences and college classes. In both studies, the strength of well-planned, coherent programs blunted the impact of other forms of socialization.

The remainder of this chapter considers research-based components of teacher education programs that show promise for strengthening preparation and professional support so that White teachers can learn to teach students of racially, ethnically, and linguistically diverse backgrounds well, first at the preservice level, then after completing teacher certification.

**PRESERVICE PREPARATION**

At the preservice level, teacher education programs commonly attend to the theory-practice linkage through university-based coursework and school-based fieldwork. In addition to those two broad sites for learning, research suggests that teacher education develop out-of-school cross-cultural community-based learning experiences. These three sites offer different kinds of knowledge and experiential resources that, when intentionally connected, have the potential to interrupt racist attitudes and understandings, and help White teachers learn to teach diverse students well. Together, they constitute a three-legged platform for preparing White teachers at the preservice level. All three legs are needed; if one or two are weak or absent, the platform does not stand.²

**Cross-cultural community-based learning**

Cross-cultural community-based learning involves learning about a community that is culturally different from one’s own by spending time there, equipped with learning strategies such as active listening and guidance in what to observe. Most White teachers have had little experience learning how to learn from someone else’s community, yet this is exactly what they will need to do in order to build pedagogy that is culturally and contextually relevant to students from backgrounds different from their own. Effective teachers of students who are racially, ethnically, culturally different from themselves have learned how to recognize and build on assets students bring, interpret students’ classroom behavior accurately, contextualize problems students bring within a sociopolitical rather than cultural deficiency analysis, and communicate constructively with adults in students’ lives. As Villegas and Lucas (2002) explained,

> To help students from diverse backgrounds build bridges between home and school, teachers need to know about the lives of the specific children they teach. While prospective teachers cannot develop this knowledge in advance in programs of preservice teacher education, they should be helped to understand what they need to know about their future students and to develop strategies for familiarizing themselves with those students.

(p. 80)

Community-based learning, when carefully planned to guide learning and reflection, can help White preservice as well as inservice teachers learn to construct intellectually inclusive classrooms. Noordhoff and Kleinfeld’s (1993) case study of the impact on a cohort of student teachers of a semester-long immersion experience in a small indigenous Alaskan community demonstrated the potential of community-based learning. The student teachers lived in the community and became involved in activities such as sewing or beading groups, local church activities, or cross-country skiing. Noordhoff and
Kleinfeld videotaped them student teaching three times over the semester. Videotapes showed them learning to shift from teaching as telling, to teaching as engaging the children with culturally relevant knowledge to connect academic knowledge with what children know.

Autobiographical accounts of White educators having learned to teach in urban schools and work against racism emphasize the power of community-based learning (Johnson, 2002; Merryfield, 2000; Smith, 1998; Yeo, 1997). Of the three legs on the platform, this may well be the most powerful venue for helping White preservice teachers begin to critically examine racism, move beyond fear, and see teaching with “a cultural eye” (Irvine, 2003). Yet, this is the leg most often missing from the platform.

Cross-cultural community-based learning experiences can vary widely in intensity and duration. Immersion experiences involve living in another cultural context for a period of time, while short visitations do not. Extended immersion experiences have potential to promote the deepest learning, mainly because they compel a person to deal with discomfort and confusion, and to learn from other people in the host cultural context. In short cross-cultural visits (say, for a few hours or a day), one immediately returns to what is known and comfortable, and may never need to question fundamental assumptions and feelings. Nonetheless, shorter, less intensive experiences are easier to construct, and can also be valuable.

Indiana University provides an example of an extended immersion experience. Since the mid-1970s, it has offered semester-long cross-cultural immersion experiences in placement sites that include the Navajo Nation, the lower Rio Grande Valley, inner-city Indianapolis, and overseas. The academic year prior to their immersion experience, preservice teachers complete intensive preparatory coursework in which they study the culture, history, lifestyle, and education of the group with which they will be placed. During the immersion experience, they carry out their student teaching while engaging in ongoing substantive community involvement in a project they co-plan with a community member. According to follow-up surveys of graduates, as well as case studies by external researchers, this experience has a strong impact on attitudes and knowledge. It helps student teachers learn to make “efforts to connect their classrooms to community people, practices, and values” (Melnick & Zeichner, 1996, p. 185). Graduates report interaction with community residents as particularly significant to their learning (Estrada, 1999; Mahan, 1982; Mahan & Stachowski, 1993–4; Stachowski & Mahan, 1998).

Shorter immersion experiences also have value. For example, Aguilar and Pohan (1998) took nine students from Nebraska to the Southwest for four and a half weeks, where they lived in Mexican households and worked on a three-week arts program for children. Riojas Clark and Bustos Flores (1997) took teacher education students for a week to Monterrey, Mexico, where they studied and experienced the prior schooling of Mexican children who had immigrated to the United States. Case studies report that, in well-structured experiences, preservice teachers see functioning communities and everyday cultural patterns first-hand, form relationships with people, confront stereotypes, and hear stories of lives that reflect abstractions they may have read about in textbooks (Aguilar & Pohan, 1998; Canning, 1995; Cooper et al., 1990; James & Haig-Brown, 2002; Marxen & Rudney, 1999; Riojas Clark & Bustos Flores, 1997; Sconzert et al., 2000). This kind of learning provides a basis for developing an alternative to deficit thinking.

The least intensive type of community-based learning involves visiting rather than living in another community. Preservice or inservice teachers visit neighborhoods or communities that differ from their own by factors such as social class, ethnicity, race, or
primary language. While there, they have a role to play (such as tutoring) or a specific
guided learning activity (such as interviewing senior citizens or constructing a community
portrait). Such experiences often take the form of service learning, in which the teacher’s
role serves a community-identified need, such as assisting in a food bank or a homework
center (Boyle-Baise, 2002).

Numerous case studies of these shorter forms of community-based learning have found
most White preservice teachers to grow conceptually and attitudinally, and to show
greater willingness to consider teaching in a community like the one in which they
were involved (Barton, 1999; Bondy & Davis, 2000; Bondy et al., 1993; Moule, 2004;
Narode et al., 1994; Olmedo, 1997; Rodriguez, 1998; Seidl & Friend, 2002; Sleeter,
1996). For example, Burant and Kirby (2002) found that community-based learning
connecting White preservice teachers with urban parents sensitized teacher candidates to
struggles parents faced, showed them that parents valued education, and taught them
to see the community as a resource for learning.

At the same time, short community-based learning experiences may not move some
White preservice teachers beyond “eye opening” (Boyle-Baise & Sleeter, 2000; Burant &
Kirby, 2002). Some researchers have noted White preservice teachers’ reluctance to
contextualize communities within broader relations of power, particularly racism. A few
researchers found the experience to confirm stereotypes some preservice teachers brought
described the difficulty of trying to give White preservice teachers depth of knowledge in
a short experience:

The development of sophisticated, culturally relevant pedagogies is a process that
requires commitment over time and lived experience. It is impossible for our students
to unlearn years of racist socialization and develop anti-racist and sophisticated
bicultural identities in one year. Thus, what we hope for is that our students begin to
understand the difficulties that arise when schools are not responsive to children’s
sociocultural experiences.

(p. 427)

Community-based learning experiences that are most productive are well-planned,
linked directly to teacher education, and involve guided reflection. Before teachers enter
someone else’s community, they learn something of its history and current issues, as well
as ethnographic research tools such as interviewing, active listening, and careful observa-
tion. Throughout the experience, the instructor helps them make sense of what they are
learning and link it to teaching. For example, for several years, I had preservice teachers
in my multicultural education course work 30 to 50 hours in predominantly African
American or Latino community centers, where they tutored children, provided recre-
ational support, or assisted in other ways. After teaching them active listening, I assigned
them to interview adults they were working with, assisting them in selecting interview
topics and questions. I also taught observation skills, such as how to discern cultural
patterns in interpersonal interaction styles, and developed guides for exploring the com-
community (see Sleeter, 2001). Throughout the semester, as students brought data into the
classroom, I helped them interpret and develop pedagogically-relevant implications of
what they learned.

Taken by itself, cross-cultural community-based learning does not necessarily lead to
excellent multicultural teaching. However, it provides an experiential foundation, which
most White teachers lack, for coursework and school-based learning.
Professional coursework on culture and equity pedagogy

Earlier I summarized research that finds White preservice teachers entering teacher education with (1) little awareness or understanding of discrimination, especially racism, (2) depressed expectations for the achievement of students of color buttressed by a taken-for-granted deficiency orientation, (3) ignorance and fear of communities of color, and of discussing race and racism, and (4) lack of awareness of themselves as cultural beings, and of communities and classrooms as cultural sites. Professional coursework, especially when linked with community-based learning, can help to address these problems.

The last 25 years have seen considerable development of such coursework. It most commonly takes the form of a separate course in multicultural education, urban education, or teaching English language learners, although a more comprehensive integration of such coursework through a program is desirable. There is a fair amount of agreement about the kinds of concepts such coursework should include. Zeichner (1996, p. 159), for example, recommended that it include the following: development of clearer ethnic and cultural self-identity; self-examination of ethnocentrism; dynamics of prejudice and racism, including implications for teachers; dynamics of privilege and economic oppression, and how schools contribute to these inequities; multicultural curriculum development; the promise and potential dangers of learning styles; relationships between language, culture, and learning; and culturally appropriate teaching and assessment. Organizationally, coursework generally begins with a sociological examination of institutional racism, historically as well as currently, an anthropological examination of culture, and a personal examination of teacher candidates’ own identities, histories, and experiences. The reason for beginning with a “big picture” rather than with specific teaching techniques is that most White preservice teachers do not understand what needs to be changed and why, and therefore tend to accept or reject what they see as appropriate practices based on their own experiences, without necessarily recognizing alternatives or harmful implications of practices they take for granted.

Many small-scale studies have examined the extent to which such a course changes the attitudes or perceptions of predominantly White groups of preservice teachers, most commonly by surveying them at the beginning and conclusion of the course. The majority of these studies found that attitudes were a bit better at the end of the course than at the beginning (Bennett et al., 1990; Bondy et al., 1993; Grottkau & Nickolai-Mays, 1989; Hennington, 1981; Lawrence & Bunche, 1986; Martin & Koppelman, 1991; Middleton, 2002; Rios et al., 1998; Tran et al., 1994; Weisman & Garza, 2002). However, most studies found very small gains; when gains were noted, they generally involved acceptance of specific teaching strategies, but not a deeper understanding of racism (VanGuntan & Martin, 2001), or negligible gains (Guillaume et al., 1995, 1998). The small reported gains in most studies may be due partly to limitations of survey instruments. Using a measure of conceptual growth as well as an attitude survey, Artiles and McClafferty (1998) found conceptual growth that was not captured on the attitude survey. This insight led them to recommend using multiple measures of growth and learning rather than a single survey.

A more significant question is how much impact a multicultural or diversity course has on subsequent teaching. The few studies that have followed preservice students into the classroom after completing coursework report mixed results, juxtaposing the power of coursework with prior life experience. Vavrus (1994) found that White student teachers in Iowa, who had earlier taken a multicultural education course, modeled themselves after their cooperating teachers, most adding a bit of ethnic content to curriculum
but doing little else. Smith (2000) compared two White preservice teachers on their willingness to use principles of multicultural education when student teaching. One, who brought prior diversity experiences, used awareness of culture as a pedagogical tool for relating to students and constructing lessons, while the other, who was otherwise a comparable and caring teacher, lacked such prior experiences and pedagogical tools. Similarly, Causey et al. (2000) found one White teacher in a three-year follow-up study to have largely forgotten equity issues and reverted to stereotypic notions about students, while the other continued to develop an activist approach to equity. They speculated that predisposition to reflection might differentiate the two (see also Lawrence, 1997).

These follow-up studies speak to the power of prior socialization and on-going everyday life experiences of White people in a racist society. While some reconsider how to interpret students from historically marginalized communities and how to teach in order to break patterns of racism in schooling, many do not or do so only to a limited degree. Adding a course into an otherwise traditional teacher education program is probably insufficient to counter such ongoing socialization and limited life experiences. Further, when the rest of the program fails to build on the course, White preservice teachers who find its content threatening often dismiss it (much as they see the rest of the program doing), turning their anger toward the course instructor (often an untenured faculty member of color).

There is evidence that preservice teachers learn more from multicultural courses that model and use the kinds of active instructional processes that work best in culturally and linguistically diverse classrooms, than from those that take a more didactic approach (Villegas & Lucas, 2002). For example, Torok and Aguilar (2000) examined what their largely White preservice teachers learned from a multicultural education course in which they were expected to read, write daily reflective journals, complete an in-depth project about a self-selected issue, and engage in a short, self-selected cross-cultural experience. The preservice teachers attributed their growth mainly to the course’s open environment in which they could discuss controversial issues and learn from each other. Similarly, Rodriguez (1998) found that when he used the same sociocultural constructivist teaching processes in his science methods course that good science teachers use to engage diverse students, including “dialogic conversation, authentic activity, metacognition, and reflexivity,” his preservice teachers learned to make science relevant to diverse students (p. 616; see also Brown, 2004).

Many active learning and reflection strategies that connect conceptual frameworks with personal experience, examine diverse points of view, and model pedagogical strategies have been the focus of action research studies. For example, shared journaling is a process in which the instructor pairs students and then assigns them to write reflections that connect reading assignments or class discussions with their own experience. Student pairs exchange journals and then read and write reactions to their partner’s journal entries; the instructor also may read and respond to journal entries. Those who have studied shared journaling in multicultural education coursework report that it prompts considerable constructive reflection (Milner, 2003; Garmon, 1998; Pewewardy, 2005).

Other active learning strategies that have been studied include the following: reading, writing, and discussing autobiographies, including one’s own autobiography (Clark & Medina, 2000; Dillard, 1996; Florio-Ruane, 1994; Rubin, 1995; Xu, 2000); engaging preservice teachers in a cross-cultural exchange through the mail (Fuller & Ahler, 1987) or through email (Lacina & Sowa, 2005; Schoorman, 2002); reading and discussing contemporary ethnic children’s literature (LaFramboise & Griffith, 1997; Nathenson-Mejía & Escamilla, 2003); using simulations (Frykholm, 1997) or debates (Marshall, 1998); involving White preservice teachers in direct discussions of racism and White
privilege (Lawrence, 1997; Lawrence & Bunche, 1996; Marx & Pennington, 2003), and involving White preservice teachers in guided research projects (Brown, 2004; Sleeter, 1996).

Active learning strategies appear to help White preservice teachers work through their defenses by engaging them in reflection about connections between key concepts and their own experiences and beliefs. Sustained didactic presentations, on the other hand, do not do this. Based on interviews with participants in a teacher education program, McDiarmid (1992) found didactic presentations about different racial or ethnic groups inadvertently to teach stereotypes and generalizations.

As preservice teachers gain awareness of what needs to be changed and why, coursework can shift to pedagogical applications for the classroom, such as how to teach content and skills using student life experiences, how to promote positive student-student relationships in the classroom, or how to assess student learning in culturally appropriate ways. The more such pedagogical coursework is directly integrated into subject-specific methods coursework, the more likely preservice teachers will make sense of it, as Rodriguez (1998) has found in his case studies of science methods taught through a multicultural and equity lens.

Villegas and Lucas (2002) recommend organizing professional coursework around six strands that move from broad awareness and attitude development, through cultivation of pedagogical skills. These strands include: (1) gaining a sociocultural consciousness, (2) developing an affirming attitude toward students from culturally diverse backgrounds, (3) developing the commitment and skills to act as change agents, (4) understanding the constructivist foundations of culturally responsive teaching, (5) learning about students and their communities, and (6) cultivating culturally responsive teaching practices. Learning experiences for these strands can be packaged in different ways. Least effective is cramming them into one separate course, or infusing the strands throughout the program in such a way that they become lost. Instead, Villegas and Lucas suggest designating courses in which each strand is addressed either as the course’s central theme, or as a significant theme among others. Offering the example of Montclair State University’s curriculum, they show how each teacher education course addresses two to five of the strands, each strand being emphasized as a central theme in at least one course. They note that planning such coursework takes a good deal of time, effort, and faculty development, but the result is a coherent rather than piecemeal curriculum.

Although it is relatively easy for programs to add or reconstruct a single course as a way of addressing diversity, little research supports this by itself as effective in preparing White teachers for racially diverse or urban schools. At the same time, there is a fairly extensive knowledge base for building a coherent curriculum, and teaching it through active learning strategies that model those that enable teachers to relate curriculum to diverse students.

Preparation in the classroom

Classroom work constitutes the third leg of the platform outlined in this chapter. Feiman-Nemser and Buchmann (1985) noted, “Teachers claim that most of what they know about teaching came from first-hand experience” (p. 53). Classroom teaching experience is essential, although a challenge for teacher education is preparing teachers who do not simply replicate prevailing practices. Feiman-Nemser and Buchmann identified three pitfalls of classroom experience: familiarity that reinforces taking much for granted rather than questioning, divergent demands of universities and classrooms that prompt teachers to bifurcate rather than synthesize what they learn in each context, and the reality that
because classrooms are not set up as learning labs for teachers, novices are incorporated into already-running systems. Feiman-Nemser and Buchmann explained that,

These pitfalls arrest thought or mislead prospective teachers into believing that central aspects of teaching have been mastered and understood . . . future teachers get into them without knowing it and have a hard time getting out. What makes them even more treacherous is that they may not look like pitfalls to an insider, but rather like a normal place to be.

(p. 63)

These challenges are particularly salient in the preparation of White teachers for schools in historically oppressed communities. Although excellent teachers exist, in most such schools a good deal of teaching is mediocre and not well-crafted to build on students’ strengths, particularly in low-income schools that have high teacher turnover. Further, considerable teaching in such schools currently is heavily didactic and scripted, with curricula focusing strongly on test preparation. How can teacher education programs work with the schools that exist to prepare White teachers to work with diverse students more effectively than is the case at present?

Early field experiences and student teaching have usually been studied separately. Most studies of White preservice teachers in early field experiences examined attitude change through work in urban schools. Most of these early field experiences were connected with a course such as literacy or multicultural education.

About half of the studies reported that a field experience in an urban school made a positive impact on preservice teachers’ perceptions of urban students, particularly African American students (Aaronsohn et al., 1995; Chance et al., 1996; Fry & McKinney, 1997; Larke et al., 1990; Lazar, 1998; Reed, 1993), although one noted that the impact was quite small (Reed, 1993). The rest found such field experiences either to result in negligible change, or to confirm preservice teachers’ racial and social class stereotypes (Deering & Stanutz, 1995; Haberman & Post, 1992; Marx, 2000; Tiezzi & Cross, 1997; Wiggins & Follo, 1999). As Tiezzi and Cross (1997) observed,

The necessity of providing direct experiences as early as possible in urban schools is fully understood. However, a dilemma arises . . . When we immerse inexperienced, misinformed, and sometimes resistant prospective teachers in urban classrooms by themselves for their first field experience, the result is predictable. The prospective teachers are overwhelmed by the urban context and focus primarily on problems rather than possibilities in teaching and learning. Our prospective teachers rely on what they’ve learned about the urban context through families, communities, churches, and media to frame their observations. For the majority of the prospective teachers we serve, this is problematic.

(p. 122)

In classrooms, preservice teachers see students reacting to institutions that, depending on the specific school or classroom, may not support the students’ cultures, identities, and intellectual capabilities. Students’ behavior in such settings often ends up reinforcing unexamined assumptions that White preservice teachers bring.

More useful than the question of whether field experiences in classrooms that serve students of color improve White preservice teachers’ attitudes and perceptions, is the question of how to construct field experiences that do so. Early field experiences commonly involve observing, helping the teacher, or tutoring children. Simply doing these
things, however, does not necessarily prompt preservice teachers to question their assumptions. Engaging preservice teachers in planned field-based learning can prompt such questioning.

Classroom field experiences that include guided inquiry with planned, extended reflection prompt more learning and questioning of assumptions than those that do not (Armaline, 1995; Brookhart, 1997). For example, Lazar (1998) had her preservice teachers interview children in urban classrooms about home literacy activities. Although some asked more and better questions than others, most of them discovered much more literacy activity and value for literacy in urban households than they had been aware of, causing many to rethink deficit assumptions about urban students’ home environments (see also Pucci et al., 2000).

Multiple field experiences in classrooms modeling different kinds of instruction seem to help preservice teachers to see the interaction between children and teaching. Commonly, White preservice teachers assume that the learning and behavior of children of color are products of the home environment rather than reactions to what happens in the classroom. Two studies examined what preservice teachers learned in classrooms that used a transmission mode of teaching compared to those using a constructivist mode (Richards et al., 1996; Ross & Smith, 1992). The researchers came to somewhat different conclusions regarding which kind of classroom prompted more preservice teacher learning, but they agreed that preservice teachers benefit when they see urban children respond to different kinds of classroom contexts. As Ross and Smith (1992) put it, “contrasting experiences may help students analyze the effect of curriculum and instruction on student learning,” especially if preservice teachers are guided in reflecting on connections between what happens in the classroom and how children respond (p. 102). Such guided reflection can help them view learning and behavior as not simply characteristics of the students themselves, but rather a result of the interaction between students and what teachers do. The benefit of comparative placements is important, particularly since teacher education programs struggle to locate optimal classrooms for field experiences. While it is imperative that novice teachers see excellent teaching of children from historically oppressed communities, excellent teachers are usually in short supply. In that case, excellent teachers can be videotaped, and videos used to help preservice teachers compare student learning and behavior in classrooms that are structured differently.

Teacher education programs often struggle with how to construct student teaching so it equips novices with practical strategies as well as helping them to question common structures and practices that do not serve historically underserved students well. Studies that focus directly on the preparation of White preservice teachers during student teaching can be examined through an analytical framework that differentiates among possible goals of student teaching. According to Cochran-Smith (1991a), the consonance approach links student teachers with school-based mentors in order to induct student teachers into using best practices. For example, Stallings and Quinn (1991) reported a study of a collaborative project between the University of Houston and the Houston Independent School District in which the main goal of student teaching was for preservice teachers to model themselves after good classroom teachers and adopt “best practices” recommended in the literature. Based in an inner city academy, the project involved close collaboration between teachers, the principal, and university faculty, offering preservice teachers a weekly seminar and daily interaction with cooperating teachers that reinforced university coursework. In a comparison of 65 graduates of this program with 20 controls, the researchers found the program’s graduates to spend less time on classroom behavior and more time on instruction, and to use more higher order questions and more positive support for students, showing that they had learned to use teaching processes they were taught.
Cochran-Smith’s second approach, critical dissonance, emphasizes preparing student teachers to contextualize schools within broader relations of power in order to question prevailing school practices, and construct alternatives. Artiles et al. (1998) reported a small case study of graduates of an urban program based on this model. The graduates reported navigating disconnected discourses during the program: their own prior beliefs, conflicting theoretical perspectives within the program (such as critical theory versus behaviorism), and beliefs of teachers in the schools. As a result, they discarded much of what they had learned in the program and learned to teach “on the job.” Student teaching that emphasizes critique appears to leave novices unclear about what to do when they begin to teach.

Cochran-Smith’s third approach, collaborative resonance, offers an alternative that connects critique with practice. This approach prepares student teachers to inquire into practice by collaborating with practicing teachers who are engaged in school-based reform. Cochran-Smith (1991b) and Cochran-Smith and Lytle (1992) studied school-based inquiry teams composed of experienced and preservice teachers who were involved in reforming culturally diverse urban schools. The experienced teachers were interested in improving their practice through reflective inquiry. Teams used school or classroom data to help generate solutions to problems, such as how to handle children who had been in kindergarten two years but were not yet ready for first grade. The preservice teachers observed good teaching, and engaged in rich conversations with practicing teachers about their methods, reasons for using them, and questions or problems they were grappling with. But rather than simply modeling themselves after practicing teachers, the preservice teachers were also learning to construct practice on classroom-based inquiry.

Research on how fieldwork in classrooms contributes to the growth of White preservice teachers is fairly limited. Not only are there relatively few studies, but they also do not follow teachers into the classroom through their first years of teaching in order to assess the impact of various configurations of field experiences. Further, early field experiences and student teaching are addressed separately in most research on preparing teachers for diverse students, although they should be connected programmatically. Professional development schools lend themselves to building seamless fieldwork (e.g. Cristol & Gimbert, 2002; Sconzert et al., 2000), although as Murrell (1998) noted, many do not explicitly address urban education, including the issues discussed in this chapter.

Learning to teach is a developmental process in which the novice typically progresses from concerns about self, to concerns about students and their learning. Learning to teach in a different cultural context can be complicated by culture shock, which is rarely discussed in the teacher education literature. This has implications for the length of student teaching and the nature of support that may be needed. Rushton (2000, 2001) studied the experiences of White preservice teachers in a Master’s degree program that focused on urban and multicultural teaching, and included a full year internship in a low-income urban school. He documented a growth process that began with culture shock, moved through various conflicts and difficulties, and then toward development of a sense of teaching efficacy by the end of the year. He noted that it took the full year, with classroom support, for the interns to shift from focusing on their personal struggles, to students’ learning and development of a sense of teaching efficacy. Had student teaching lasted only a semester, it would have ended while the interns were still navigating culture shock (see also Luft et al., 1999). While Rushton noted the value of a full year of student teaching, I suspect that student teaching need not last a year if the program is purposefully designed to move White preservice teachers in a coherent way through culture shock and toward culturally relevant pedagogy that centers on students’ intellectual needs.
Some would argue that content acquisition and classroom experience are the only form of preparation teachers need, that community-based learning is unnecessary, and that professional coursework breeds mediocrity. Such is the assumption behind test-only certification programs (e.g. the American Board for Certification of Teaching Excellence) and abbreviated programs (e.g. Teach for America). While some researchers have found alternatives to teacher education to produce teachers whose students' test scores are comparable to those of teachers from conventional teacher education programs (Decker et al., 2004), others have found students of teachers from such alternatives to score significantly lower (Laczko-Kerr & Berliner, 2002). Notably, one does not find abbreviated teacher certification programs helping White teachers become better at closing racial achievement gaps. Such programs do little or nothing to confront teaching inadequacies that stem from race- and class-related beliefs, fears, ignorance, and limited life experience.

**Connecting the three legs**

I have maintained that a coherently-planned teacher education program that explicitly addresses issues and concerns of White preservice teachers can prepare them to teach diverse populations more effectively than can traditional programs of teacher education or certification routes that by-pass teacher education. I build this case mainly on pieces of evidence rather than on a comprehensive study of such a program. Here, I examine the very small body of comparative research that sheds light on this topic.

There is evidence that community-based learning linked with professional coursework is more powerful than either by itself. Bondy et al. (1993) compared the effects of community-based learning alone and paired with a multicultural education course on White preservice teachers’ perspectives about urban students. They concluded that “fieldwork alone, even when it involved direct contact with children who were different from the tutors, did not change tutors’ beliefs about the causes and consequences of being different” (p. 61). In a study comparing the impact of a stand-alone cultural diversity course with a course linked with community-based learning, Brown (2004) reported a similar finding. Most community-based learning projects discussed earlier were linked with coursework, and these two comparative studies confirm the importance of such linking.

Some evidence suggests that community-based learning should occur early in a teacher preparation program. Based on a study of the relationship between community-based and school-based fieldwork, Burant and Kirby (2002) found the former to provide a foundation for the latter. For example, they reported that preservice teachers “who interacted with parents overwhelmingly reported much greater understandings about the structural obstacles parents face and were convinced that the majority of parents were doing their best to make wise choices for their children” (p. 571). Such preservice teachers were in a better position to respect the parents and children than were those who had not interacted with parents. Further, the researchers stressed the value preservice teachers found in learning how to learn about students through the community before teaching them.

Imagine, then, a program that includes: (1) community-based learning connected with professional coursework emphasizing reflection; followed by (2) early field experiences in culturally diverse classrooms connected with professional coursework that examines culture, language and learning; continuing with (3) foundations and methods coursework that is explicitly designed around teaching diverse students; and culminating in (4) student teaching in a school that serves a historically oppressed community, designed around a
model of collaborative resonance. Further, the whole program is long enough to support
preservice teachers through culture shock, to respectful engagement. To what extent does
such a program make an impact? Unfortunately, data are far too thin to know. Three
studies of programs designed around diversity examined their impact on predominantly
White preservice teachers’ beliefs. One reported a positive impact (Capella-Santana,
1989) and two reported limited impact (Artiles et al., 1998; Burstein & Cabello, 1989).
None described the programs in much detail, however, nor did they examine the impact
of the program on the teacher candidates’ classroom teaching abilities.

The research reviewed above, while too fragmented to be conclusive, suggests that
coherent programs that are designed explicitly to address the limited experiences, knowl-
edge gaps, fears, and biases common among White preservice teachers are likely to
produce educators who are at least as effective, if not more so, than traditional programs
tend to do. The research does not suggest, however, that even a strong, coherently
planned program will overcome the prior socialization of all White preservice teachers.
Many of the studies mentioned above identified White preservice teachers who continued
to resist or dismiss what the program was trying to teach related to diversity. For
example, Smith (2000) and Causey et al. (2000) found that some White graduates of
programs that aimed to prepare them to teach cross-culturally “forgot” what they had
learned once they began to teach.

The above research suggests that predisposition to working with students from non-
mainstream cultures and languages and to equity matters, should be taken into consider-
ation when selecting applicants into teacher education. Consider the teacher who knows
algebra well and knows how to teach it to children much like herself, but believes that
her low-income Black, Latino, and Indian students are not only too far behind to learn
algebra, but also too uninterested and too lacking in home support. She does not lack
teaching methods or content knowledge, but rather belief in the academic capabilities of
her students and willingness to gear her teaching toward those students.

I believe that, rather than admitting White preservice teachers on the basis of grade
point average and test scores alone, we need to become much more intentional about
selecting or counseling out those prospective teachers who lack the willingness (or matur-
ity) to learn to teach cross-culturally. Currently, although some teacher education pro-
grams are experimenting with ways to do this fairly, there are few tested systems for
doing so. Haberman (1995; 1996), based on his observations of star urban teachers,
developed an interview process that helps identify prospective teachers who have
dispositions (such as a strong belief in children, capacity to learn from mistakes, and
willingness to explore and try alternatives) that will enable them to learn to teach well
in urban schools. Preservice teachers who have these dispositions are generally older
(thirty to fifty years of age) and usually bring experience living in an urban environment.
Adopting his interview is not a panacea, but it offers a way of conceptualizing program
admission based on willingness and ability to learn to teach cross-culturally.

MENTORING AND RETAINING WHITE TEACHERS IN
DIVERSE SCHOOLS

The first two to three years of teaching are critical. During that time, many patterns of
teaching, believing, and relating to students become solidified. Novice White teachers
face at least three challenges. First is ongoing socialization in the forms of everyday life
experience in a relatively racist and segregated society, as well as socialization into the
beliefs and practices of other, more experienced teachers. Very often, both reinforce a
tacit belief in the superiority of the White ways of doing things and perceiving the world, and a colorblind perspective toward race (Sleeter, 1992). Second is the crucible of the classroom, in which novice teachers form relationships with students and figure out what seems to work with them. From the first day, through an interactive process, teachers and students size each other up and establish patterns that can range from supportive to punitive, intellectually demanding to deadening. Race, culture, and social class are highly potent filters through which teachers and students interpret each other; the intensity of classroom life wears quickly on shallow good intentions. Third is the task of connecting professional knowledge with practice, and continuing to deepen both in order to develop teaching efficacy. While there is a significant body of professional knowledge related to excellent teaching of students from historically oppressed communities, novice teachers who are unsure how to connect professional knowledge with everyday classroom practice are likely to dismiss it as “theory” that does not “work.” Failure to address these three issues quite often results in White teachers giving up and either leaving the profession, taking jobs in the suburbs as quickly as possible, or adopting a custodial model of teaching students.

The professional literature on mentoring, retaining, and professionally developing White teachers in diverse or urban schools is quite thin. Nevertheless, it offers some guidance. One-shot workshops, still common in multicultural education, have little if any effect. As with preservice teacher education, didactic presentations about groups are more likely to teach stereotypes than improve teaching (McDiarmid, 1992). Staff development projects that are too broad, attempting to re-work teachers’ worldviews, are often met with resistance and conflict (Leistyna, 2001; Sleeter, 1992).

Professional development programs with the most promise combine ongoing practice-based inquiry with classroom-based coaching. These processes can occur through a variety of staff development venues, including beginning teacher induction, professional development schools, teacher networks, school reform projects, or university coursework. The venue appears itself to be less important than the extent to which it (1) involves teachers in thinking deeply about their own practice and assumptions; (2) supportively stretches novice White teachers beyond their existing beliefs and understandings; (3) is facilitated by someone with a deep commitment to and knowledge about education in communities of color; and (4) maintains a clear and consistent focus on helping teachers meet the intellectual needs of their students, without becoming sidetracked. Below are examples.

Several studies have found sustained workshops combined with classroom coaching beneficial to teachers, particularly those in historically low-achieving schools. For example, Johnson and Kean (1992) developed and evaluated a project that involved intensive summer workshops on teaching science in multicultural settings. The workshops focused on matters such as using classroom-based processes for identifying strengths of students, problem solving in science, and cooperative learning. General meetings of participants were held quarterly for discussion and problem solving. Classroom-based coaching twice per month provided teachers with additional support. The researchers documented positive changes in teacher-student interactions, and classroom pedagogy (see also Lindley & Keithley, 1991). Many teacher induction programs are built on this model, although as Mendoza Reis (2001) found in her research on California’s teacher induction program, classroom support providers who lack knowledge about culturally relevant teaching cannot help novices learn to do this very effectively.

Inquiry-based teacher networks and inquiry-based graduate coursework can help support novice White teachers when the focus is on teaching excellence in culturally diverse contexts (Exposito & Favela, 2003; Jennings & Smith, 2002; Moss, 2001; Sleeter, 2005).
For example, the University of Pennsylvania has been involved in a teacher network inquiry project that has been in existence for over two decades; Cochran-Smith’s (1991b) work, noted earlier, was part of this network. As El-Haj (2003) explains, working in collaborative inquiry groups, the teachers (most of whom are White) focus deeply on one child, analyzing the child’s work in order to construct a portrait of him or her as an intellectual. The inquiry process moves outward, from the particulars of one child, situating the child in a social and cultural context. Through this inquiry process, teachers develop genuine respect for children’s intellectual abilities, and learn to navigate the sometimes conflicting demands of individual children and broad systems in which children need to learn to succeed.

In the context of graduate coursework, Moll and González (1994) helped teachers improve their teaching through structured home visits, a form of community-based learning. After instructing teachers how to conduct interviews, they had teachers identify children whose families they would like to learn more about in the context of non-intrusive home visits. While in the home, teachers learned about household “funds of knowledge,” areas of expertise that family members have as a part of everyday life, such as carpentry, cooking, or mechanical repair. Teachers also learned about family social networks to become acquainted with various people in the community who interact with children and the family. After the home visits, Moll and González helped teachers to build curriculum to connect academic knowledge with the knowledge family members teach their children.

Professional development that is embedded within a larger school reform project can support novice White teachers, if it is not excessively top-down and attends to the needs of novice teachers. Darling-Hammond and colleagues (2003) studied a district-wide professional development program in San Diego that focused on improving literacy instruction, then expanded to other subject areas. The project involved principal professional development, teacher workshops, and the nurturing of a network of well-trained peer coaches who worked directly with teachers in their classrooms. The researchers were able to document a significant improvement in student achievement, particularly among students who had been previously least-well served. They noted, however, that teacher satisfaction with the program varied. Many teachers saw it as too centralized and standardized; the school district was in the process of experimenting with more flexibility and school-based decision-making. The researchers stressed the importance of reform projects striking a productive balance between bottom-up and top-down planning and decision-making.

CONCLUSION

It is urgent that teacher educators work much more purposefully toward developing coherent programs that can help White teachers learn to teach diverse populations well; it is also urgent that systematic research on such programs be conducted. Although we do not yet have research data that confirm the effectiveness of programs following the model I have sketched in this chapter, we do have research that confirms the limited experiences, misconceptions, fears, and biases that White preservice and inservice teachers bring to the profession, and the negative impact on those on classroom practice. There is also enough research suggesting interventions and supports that make a difference, to warrant taking action. Improving schools that serve students from historically underserved communities demands that we do so.
NOTES

1 There is also an urgent need to diversify the teaching force, and to prepare all teachers to teach diverse students well. Since other chapters in this handbook take up these issues, this chapter focuses on preparation of White teachers.

2 This platform is not intended to substitute for other important components of teacher education, including content preparation, but rather to complement them.

Preparing teachers of color to confront racial/ethnic disparities in educational outcomes

Ana María Villegas and Danné E. Davis
Montclair State University

Many advocates of educational equity look back to the 1970s and early 1980s as a time of hope. During that period, the Black-White and Hispanic-White achievement gaps narrowed in both reading and mathematics (Lee, 2002). These welcome changes were attributed, at least in part, to the implementation of policies initiated in the 1960s for the purpose of equalizing educational and economic opportunities in the United States (Hedge & Nowell, 1998; Grissmer et al., 1998). Such efforts included federally-funded preschool programs, special programs in elementary schools with high concentrations of poor children, attempts to broaden the participation of students of color in post-secondary education, and expanded welfare and employment initiatives for families living below the poverty line. In the latter part of the 1980s, however, progress toward eliminating the racial/ethnic achievement gap stalled. While African American and Hispanic students continued to make modest gains at the basic skills level, the gap in achievement at the advanced skills level began to widen substantially around 1988, a trend that has continued (Campbell et al., 2000; Lee, 2002). Interestingly, this setback occurred precisely at a time when African Americans began to experience stagnation in their economic position relative to White Americans, and Hispanics began to suffer a substantial economic decline (Smith, 2001).

The test score gap is not the only evidence of disparity in educational outcomes. Relative to White students, African American and Hispanic students are overrepresented in special education programs (Coutinho & Oswald, 2000) and lower academic tracks (Lucas, 2001); are more apt to repeat a grade (Campbell et al., 2000) and/or drop out of high school (Swanson, 2003); and are less likely to enroll in and graduate from college (Havey & Anderson, 2005). Such differential outcomes have profound consequences for students of color, limiting their future employment, earnings, and overall life chances (Carnevale, 1999). Those consequences are magnified in the current global information-based economy, in which people lacking a strong basic education are apt to become part of the unemployed or underemployed classes. Given the stakes involved, it is not surprising that the racial/ethnic achievement gap has generated increasing unease among equity-minded citizens, educators, researchers, and policymakers. The urgency of this problem, which has both moral and economic implications, is exacerbated by the growing numbers of students of color in elementary and secondary schools.

To make serious progress toward eradicating the achievement gap, policymakers will have to address the considerable economic disparities that currently exist between people of color and White people in the United States. Clearly, with the current poverty rate as high as 34 percent among African American children and 30 percent among Hispanic children (U.S. Census Bureau, 2005), schools are seriously challenged in their efforts to improve the academic success rates of these student groups (Berliner, 2005). At the same time, educators and policymakers must take measures that have the potential to change
the dynamics of classrooms and schools with the goal of improving the academic outcomes of students of color. Increasing the diversity of the teaching force is one such measure that merits public attention.

Three major arguments for diversifying the ranks of teachers are posited in the literature. The most widely cited rationale is that teachers of color can serve as role models for students of color, inspiring them to believe that they too can become successful professionals if they apply themselves academically (Stewart et al., 1989). A second rationale, mentioned less frequently, is that teachers of color tend to have higher expectations for students of color than White teachers do, and are more apt to place greater academic demands on them, thereby enhancing these students’ school performance (Irvine, 1990). A third argument has been voiced more recently. It is said that racial/ethnic minority teachers are uniquely positioned to use their first-hand knowledge about the cultural background and everyday life experiences of students of color to help them build bridges to learning. The notion is that what these teachers know about the communities students of color come from as well as barriers they face in life enable them to work more effectively with this population (Irvine & Armento, 2001; Villegas & Lucas, 2002). Underlying each of these rationales for increasing the diversity of the teaching force is the assumption that students of color will benefit academically from exposure to teachers who are racially/ethnically similar to them. Acting on this assumption, 30 states have developed teacher diversity policies since 1990 (ECS, 2003).

In this chapter, we assess the merit of policies that aim to recruit more people of color into the teaching profession, review the impact of those policies to date, and identify gaps in teacher education programs that require immediate attention if ongoing teacher recruitment efforts are to fulfill their promise to improve the school performance of minority students. First, we review the expanding empirical literature regarding the effect of teacher race/ethnicity on student learning. We then describe the salient elements of minority recruitment policies developed in the 1990s, discuss the impact of those policies on the racial/ethnic composition of the teaching force, and identify potential problems that could derail ongoing efforts to diversify the ranks of teachers. In the third section, we argue that teacher education programs, even when designed to address issues of diversity, focus their attention almost exclusively on the preparation needs of White candidates while ignoring the needs of minority candidates. We also present several strategies intended to improve the preparation of candidates of color. In the final section we offer a brief summary and recommendations.

The chapter draws on different types of data. Our analysis of the effect of teacher race/ethnicity on student learning is built on quantitative empirical studies conducted primarily by economists and sociologists, and reported for the most part in peer-reviewed journals of those fields. Many of these studies draw on national databases, such as the National Educational Longitudinal Study (NELS) of 1988. We also build on a comprehensive synthesis of research on teacher-student interactions that includes experimental studies, survey studies, and classroom observation studies. Our discussion of minority recruitment policies and the events that led to the adoption of such policies is informed by the following: teacher and student demographic data collected by the National Center for Education Statistics as part of its Schools and Staffing Survey; influential reports issued by well-respected education-related organizations and agencies; and descriptive and evaluative studies of programs and strategies for recruiting people of color into teaching. Our assessment of existing problems regarding the preparation of candidates of color in teacher education as well as the strategies we propose for addressing them draw on two emerging lines of research—one focusing on the experiences of candidates of color in teacher education and the other on culturally-relevant practices of
teachers of color. Much of this work uses a case study methodology. All empirical studies reviewed in this chapter are consistent with the principles of scientific research identified by the National Research Council (Shavelson & Towne, 2003), which, although debated in the education community, are used widely.

**DOES TEACHER RACE/ETHNICITY MATTER? A LOOK AT THE EVIDENCE**

As mentioned above, minority teacher recruitment policies are motivated largely by the poor school performance of students of color. An assumption underlying these policies is that minority teachers, considered as a group, are more adept at teaching minority students than are White teachers. To judge the merit of this assumption, we identified 15 empirical studies that addressed this issue. The result of our review is presented in three parts. We first consider six studies that examined the effects of teacher race/ethnicity on student achievement as measured by scores on standardized tests. We then review five studies that explored the relationships between teacher race/ethnicity and student outcomes as measured by indicators other than test scores (e.g. absenteeism, high school dropout rates, college going rates, and enrollment rates in advanced-level high school courses). Finally, we focus on research that examined whether teacher-student racial/ethnic pairings influence teachers’ perceptions, expectations, and treatment of students.

**Student test scores as outcome measures**

We examined six empirical studies of the effect of a teacher’s race/ethnicity on student learning as measured by students’ performance on tests. To determine how having a same-race teacher influences student learning, Dee (2004) reanalyzed test score data from the Tennessee Project STAR class-size experiment conducted in the late 1980s, in which students and teachers in the participating schools were randomly assigned to one another. In the original experiment, scaled scores from the Stanford Achievement Test in math and reading were used as the outcome measures. Dee discovered that racial pairing of teachers and students significantly increased the reading and mathematics achievement scores of both African American and White students by approximately three to four percentage points. He also found that racial pairing had cumulative effects on student learning, with students gaining two to four percentile points in both mathematics and reading for each additional year of exposure to a same-race teacher. The race effects were particularly strong among poor African American children attending segregated schools. Because students and teachers were randomly assigned to each other as part of the original class-size experiment, the results reported by Dee effectively control for unobserved student level determinants of educational achievement. These results support the assumption that increasing the racial/ethnic diversity of the teaching force can improve the academic achievement of students of color. However, given that the sample included students only from Tennessee, the generalizability of the findings is limited.

Clewell et al. (2005) used data from Prospects—a congressionally mandated study of educational growth and opportunities for American students—to investigate whether exposure to a same-race teacher was related to the reading and mathematics achievement of African American and Hispanic students in elementary schools. Scaled scores from the Comprehensive Test of Basic Skills were used as learning outcomes in this study. Clewell and associates found that for Hispanic fourth- and sixth-grade students, having a Hispanic
teacher resulted in higher test score gains in mathematics. The same effect was noted in reading, but only in the fourth grade. For Black students, the effect of having a same-race teacher was somewhat weaker. Nevertheless, Black students in the fourth grade demonstrated significantly higher score gains in mathematics when taught by a Black teacher.

As part of a broad investigation of the effects of family and schools on children’s scholastic achievement, Hanushek (1992) examined the impact of selected teacher characteristics, including race, on student learning. The empirical analysis drew on data about the family generated between 1971 and 1975 by the Gary Income Maintenance Experiment. These data were merged with school information on the children from the families in the experimental group. All students in the sample were Black. The school data included scores from the Iowa Reading Comprehension and Vocabulary tests, along with background information about the teachers of those students. Hanushek’s analysis showed that White teachers in the sample were significantly less successful than Black teachers in increasing student achievement in both vocabulary and reading comprehension. Because the study did not include controls for teacher background variables, Hanushek concluded that either the Black teachers in the sample were more effective teachers of Black students or the White teachers who were attracted to the Gary schools (settings with a high concentration of poor Black students) were less skilled overall than their Black colleagues.

Evans (1992) investigated the influence of having a same-race teacher on the economic literacy of African American high school students. Data for this study were drawn from the National Assessment of Economic Education Survey administered in 1987 by the Joint Council on Economic Education. The survey included information for 3,266 students relating to their education, family background, teachers, schools, and school districts. Evans focused his analysis on the subset of 2,440 surveyed students who had taken an economics course. Scores on the Test of Economic Literacy, which all students in the sample had completed at the end of their economics course, was the dependent measure used in this study. Evans found that after controlling for teacher and student ability, African American students taught by African American teachers scored 2.25 points higher on the test than African American students taught by teachers of another race/ethnicity. The effect was particularly strong among students whose mother/female guardian was not college-educated. Based on these findings, Evans argued that increasing the representation of African Americans in the teaching profession would appear to have important academic benefits for Black students.

Ehrenberg and Brewer (1995) reanalyzed data from the Coleman Report of 1966 to determine whether the characteristics of teachers in a school (including the racial composition of the teaching staff) influenced the “synthetic gain scores” of the students. Synthetic gain scores were defined as the difference between the average test scores of students in upper and lower grades. The researchers restricted their analysis to the 969 schools for which test scores on verbal aptitude, nonverbal aptitude, reading, and mathematics were available for both third- and sixth-grade students. At the high school level, they limited their attention to the subset of 256 high schools for which the aforementioned data were available for ninth- and twelfth-grade students. The study used an econometric model that allowed the researchers to account for the non-random nature of teacher assignment to schools. Holding teacher characteristics other than race constant, the researchers found that an increase in the percentage of Black teachers in a school was associated with higher gain scores for Black high school students. However, no effects were detected for Black students in elementary school.

Using the National Educational Longitudinal Study (NELS) of 1988, Ehrenberg et al. (1995) examined the effect of teacher race on the academic achievement of students of
different races. Scores on tests of reading comprehension, science, history/social studies, and mathematics developed by the Educational Testing Service were used as measures of student outcomes. In contrast to the results reported above, Ehrenberg and his colleagues found no evidence that a racial/ethnic match between teachers and their students was related to how much the students learned between the eighth and tenth grades in each of the four subject areas.

It is impossible to reach any definitive conclusion about the merit of teacher diversity policies based solely on the results of the six studies discussed above. For one thing, the evidence is thin, and although a clear pattern emerges, the results are not uniformly supportive. Furthermore, because data involving studies of real students in real classrooms cannot be collected under “pristine” laboratory conditions, it is nearly impossible to isolate the effects of teacher race/ethnicity on student learning from other potentially intervening teacher, student, and school variables. As a result, all six studies suffer from some sort of limitation. Even when random assignment of students and teachers is used, as in the Dee study, the generalizability of inferences that can logically be made from the findings is limited, given that the sample included students, teachers, and schools from a single state. Despite these limitations, the evidence generated by the six studies reviewed above cannot be ignored. Collectively, these works suggest that a teacher’s race/ethnicity plays an important role in how much his or her students will learn, as measured by tests. There is also some evidence that teacher race/ethnicity influences student learning both at the classroom level (with students of color who are paired with a same-race/ethnicity teacher experiencing favorable academic effects) and at the school level (with schools that have a large concentration of teachers of color producing larger effects on student learning). These works, however, provide no insight into the underlying mechanisms by which teacher race/ethnicity influences student learning.

Outcomes other than test scores
While test score gains are critically important indicators of learning, there are other important student outcomes that also warrant attention (Cochran-Smith & Fries, 2001). We now turn to a subset of studies that examined whether benefits other than test score gains accrue to students of color when they are taught by teachers of color. Farkas et al. (1990) used the Southwestern City School District Data Set to determine the relationship between teacher race/ethnicity and absenteeism among African American students in large urban high schools. Because absenteeism reduces students’ instructional time, it limits their opportunities to learn. Farkas and colleagues found a strong inverse relationship between the two variables of interest in this investigation. That is to say, African American students who were taught by a same-race teacher displayed markedly lower rates of absenteeism.

Using data collected during the 1980s from 82 urban school districts in this country, England and Meier (1986) set out to determine the effect of various district variables—including the proportion of Black teachers—on a summary variable they called “second generation discrimination.” As used in this study, second generation discrimination consisted of eight specific indicators—placement in special education, placement in classes for the educable mentally retarded, admission to gifted programs, admission to enriched classes, suspension from schools, dropping out of school, attending vocational schools, and attending college. The regression model used by these researchers showed that as the proportion of Black teachers in a district increased, incidents of second generation discrimination decreased significantly. Taking a similar tack, Klopfenstein (2005) examined the impact of the percentage of Black mathematics teachers in a school on the likelihood
that Black students who completed a geometry course would enroll in an Algebra II class the following year. She found that Black students’ enrollment in Algebra II increased significantly as the percentage of mathematics teachers who were Black increased. Given the critical role that advanced courses such as Algebra II play in high school students’ access to college, Klopfenstein’s finding is particularly relevant for those interested in increasing the college-going rate of African American high school students.

There is also evidence that an increase in the proportion of racial/ethnic minority teachers in a high school reduces the dropout rates of minority students and boosts their college-going rates. Fraga et al. (1986) showed both of these effects to be true for Hispanic students enrolled in large urban school systems that have a sizeable concentration of Hispanic teachers. Similarly, Hess and Leal (1997) found that after controlling for relevant factors, large urban school districts with a high percentage of teachers of color had significantly higher overall college matriculation rates.

The five studies reviewed above suggest that students of color are likely to derive academic benefits from exposure to teachers of color. These works further suggest that such benefits can result from direct contact with a teacher of color in a given classroom (as illustrated in the Farkas et al. study) as well as from exposure to school settings with a large concentration of teachers of color. Yet as we observed in our discussion of studies that focused on student test score gains, this second set of works sheds little light on the dynamics of interaction between teachers and students that influence student outcomes. To seek insight into this topic, we turned to an extensive body of research that examines whether pairings by race/ethnicity influence teachers’ perceptions, expectations, and treatment of students. Arguably, teachers’ perceptions and expectations of students have an impact on the learning opportunities they create in the classroom. This line of research dates back to the 1960s, a time when many educators, researchers, and policymakers were concerned about the impact of school desegregation on students. Their concern was related to the fact that the Brown v. Topeka Board of Education decision of 1954 had been based largely on the assumption that students of color would make substantial academic gains when taught in integrated classrooms. While a review of this vast literature is beyond the scope of this chapter, highlights drawn from a frequently-referenced synthesis of research are instructive. We supplement those highlights with several more recent studies of teacher perceptions, expectations, and treatment of students that have direct bearing on the theme of this chapter.

**Teacher perceptions, expectations, and treatment of students**

Irvine (1990) conducted a comprehensive synthesis of studies that focused on teacher expectations as related to teacher and student race. Specifically, she reviewed 35 studies, all conducted between 1964 and 1983, that examined the expectations of Black and White teachers for Black students. Five of the studies used an experimental design in which the teachers were told to expect certain achievement performance from the students. Eighteen other studies, all of which involved the administration of questionnaires, compared teachers’ perceptions of and attitudes toward African American students to their perceptions of and attitudes toward White students. The remaining 12 studies examined teacher expectations of students in actual classroom settings.

Based on her review, Irvine concluded that White teachers’ perceptions of Black students tend to be less favorable than their perceptions of White students, and they tend to expect less of Black students than Black teachers do. For instance, in the studies Irvine reviewed, White teachers used negative terms such as “lazy” and “rebellious” to describe African American children. Furthermore, they thought them to be less skilled in language
and mathematics, believed they had less potential for achievement, found them more disruptive, and considered them less attractive physically than White children. These unfavorable views were conveyed to the students in unambiguous ways. For instance, White teachers tended to give Black learners less attention, less encouragement, less eye contact, more verbal and non-verbal criticism (especially to Black boys), and less positive feedback after correct responses to questions. Irvine contended that this differential treatment in turn affected Black students’ self-concept, classroom conduct, achievement, motivation, and level of aspiration. She also asserted that such disparities in teacher expectations and treatment of students contribute in a very significant way to the lower academic achievement of Black children.

As Irvine’s conclusions were based on research conducted more than 20 years ago, it might be tempting to dismiss them. Issues of cultural diversity have received considerable attention in elementary and secondary schools, as well as teacher education, over the past two decades. Even so, while it is likely that teachers have become more culturally aware, such exposure does not necessarily translate into improved patterns of classroom interaction. In a more recent study, Casteel (1998) examined White teachers’ interactions with Black and White students in racially integrated classrooms, focusing specifically on the amount of acceptance and feedback students received. The 417 students in this study were all considered low academic achievers and had been placed in their classes based on test scores. The 16 White teachers, all experienced educators, had recently received favorable evaluations from their principals. Each teacher was observed teaching two full class periods during the school year. Data were collected by using the Brophy-Good Dyadic Interaction Observation System. Casteel found that compared to White students, Black youngsters were asked fewer of the more demanding process questions, were offered guided clues following an incorrect response less frequently, were praised after giving a correct answer less frequently, and were encouraged to ask questions less frequently. The results of this study suggest that in spite of the passage of time and increased attention being given to matters of diversity in K-12 schools and programs of teacher education, Black students continue to experience more negative interactions with their teachers than their White counterparts, even when they are at a comparable skills level.

The attitudes of teachers toward students of color have been the focus of several other recently published studies. In a complex investigation that drew on NELS 1988 data, Oates (2003) set out to determine, among other things, the effect of racial pairing of teachers and students on teachers’ perceptions of African American and White tenth graders. The dependent variable for this aspect of the study was a composite construct that included whether the teacher expected the student to go to college, as well as her/his appraisal of the frequency with which the student completed assigned homework, was tardy, was attentive, and was disruptive. Oates found that White teachers had significantly less favorable perceptions of Black students than of White students, even when controlling for relevant student variables (e.g. prior GPA, prior scores on standardized tests, and current grade track placement). By contrast, African American teachers’ perceptions of students were based on observable indicators of their performance. According to Oates, the pairing of Black students with Black teachers “shielded” the students from the anti-Black perceptions of White teachers.

Dee (2005) also analyzed NELS 1988 data to determine the effect of racial pairing of teachers and students on teachers’ subjective assessments of student behavior and performance. Because the NELS database includes student-specific evaluations from teachers in two different subject areas, he was able to use a fixed-effect econometric model that identified how two racially different teachers assessed the same student. This innovative aspect of the analysis allowed Dee to control for potential bias created by the
non-random assignment of students within and across schools. Focusing on negative
teacher assessments, he looked specifically at the frequency with which a teacher per-
ceived a student to be disruptive, inattentive, and unlikely to complete homework
assignments. Dee found that both African American and Hispanic students were more
likely to be viewed unfavorably by a teacher who was not of the same race/ethnicity.
These teacher effects were most striking for students from economically poor families.

The results reported by Oates (2003) and Dee (2005) are consistent with those pub-
lished earlier by Alexander et al. (1987), Ehrenberg et al. (1995), Farkas et al. (1990),
and Irvine (1990). These findings are particularly disturbing in light of evidence that to
succeed academically, students of color depend more on their teachers than White stu-
dents do (Ferguson, 2002; Jussim et al., 1996). While it is still an open question whether
observed disparities in teacher expectations are biased by racial stereotypes or conditioned
on observable indicators of student performance, the empirical literature overwhelm-
ingly shows that racially dissimilar teacher-student pairings result in poor subjective
assessments of students of color. Considered together, the evidence suggests that same-
race pairings offer students of color a supportive environment that protects them to some
extent from disproportionately negative subjective teacher appraisals and the potentially
harmful consequences of such judgments for their academic performance.

To summarize, the evidence reviewed in this section supports the assumption that a
diverse teaching force can generate important academic gains for students of color. Five
of the six studies dealing with the effect teachers have on their students’ test scores
showed that, under certain conditions, exposure to a minority teacher results in higher
test scores for minority students. If one broadens student outcomes to include other
academic indicators—such as absenteeism, placement in special education, suspension
from school, enrollment in advanced mathematics classes, high school dropout rates, and
college matriculation rates—the case for diversifying the teaching force is made even
stronger. Moreover, if one also considers the results of studies that tested for the effect of
racial/ethnic pairing of teachers and students on teachers’ subjective assessments of stu-
dents of color, the case for minority recruitment policies becomes compelling.

We suspect that the dynamics of racial interactions in classrooms aptly described by
Irvine (1990) explain, to a large extent, the teacher effects reported in most of the studies
we reviewed. Another plausible explanation is that these teacher effects are conditioned
by the phenomenon Steele (1997) calls “stereotype threat.” According to this theory,
students of color experience anxiety in situations where they perceive that stereotypes are
likely to be perpetuated (e.g. students of color might think their White teachers believe
them to be inferior academically). Such anxiety could interfere with the learning process
and lower the students’ academic outcomes. Interactions with teachers of color might
reduce or eliminate the stereotype threat for minority students, allowing them to focus
more directly on learning. Still another credible explanation for the beneficial academic
outcomes that minority students derived from exposure to minority teachers reported in
nearly all the studies reviewed above is that educators of color are able to draw on their
own cultural experiences to help students of color (who are culturally similar to them)
engage in learning. Clearly, additional research is needed to understand more fully the
intricacies of the relationship between teacher race and student academic gains. Never-
theless, on the basis of available evidence, we believe that existing minority recruitment
policies warrant continued support.

The merit of policies that seek to diversify the teaching force should not be decided
solely on the basis of empirical evidence. One could legitimately argue that diversity in
teaching is in keeping with the values of our pluralistic, democratic society. Schools
not only facilitate the development of knowledge and skills, they also send powerful
messages about what is valued by local communities and the larger society. If youngsters of color are exposed to a disproportionately small number of teachers of color, they could learn implicitly that people who are like them racially/ethnically are unsuited to be conveyers of the knowledge and skills valued by our society. Similarly, if White students do not see racial and ethnic diversity among their teachers, they may not come to value such diversity in their fellow citizens.

By advocating for minority teacher recruitment policies, we are not suggesting that White teachers are incapable of teaching students of color effectively. In fact, there are many well-documented examples of White teachers who have been highly successful in teaching students of color (see Ladson-Billings, 1994; Lucas et al., 1990; Paley, 1989). Neither are we suggesting that people of color, merely by virtue of their complexion or ethnicity, possess a natural aptitude for teaching students of color. We are also not proposing that teachers be assigned to students based on their race and ethnicity. Instead, we believe that the teaching profession as a whole stands to gain from the infusion of expertise about minority cultures, perspectives, and experiences that people of color would bring to it. For example, teachers of color can help to expand our understanding of culturally responsive teaching. They also can help their White colleagues interpret the cultural backgrounds of students of color. In short, people of color can diversify the teaching profession by bringing alternative perspectives to problem solving. Ultimately, their increased presence in the teaching force can provide a means for improving the preparation of all teachers who work with students of color. At the same time, all White teachers at both the pre-service and in-service levels need intensive preparation to help them become responsive educators for an increasingly diverse elementary and secondary student population (see chapter by Sleeter in this volume). Similarly, prospective and in-service teachers of color need support to incorporate their personal understanding of students of color into pedagogical practices, as we discuss in a subsequent section of this chapter.

The minority teacher shortage: sources of the problem and proposed solutions

The shortage of teachers of color first gained national attention toward the end of the 1980s when conflicting trends in the racial/ethnic compositions of the K-12 student population and the teaching force became evident. Figure 33.1 illustrates these trends for the 15-year period from 1971 through 1986. The figure shows that as student enrollments became more diverse over time, the teacher population became less so. Specifically, the racial/ethnic disparity between students and educators more than doubled during this period.

![Figure 33.1 Percentage of minority teachers and minority students in public elementary and secondary schools, 1971–1986.](image)

Sources: Student data derived from U.S. Department of Education 2001; teacher data derived from NEA 2003.
15-year period. Concerned by these conflicting demographic trends, leaders in communities of color argued that without active intervention, the cultural divide already obvious in many classrooms across the country would become even more striking in the future (Graham, 1987; Irvine, 1988; Tomás Rivera Center, 1993).

The reasons for the short supply of teachers of color are complex. A leaky pipeline is an apt representation for the dynamics of the shortage (Villegas & Lucas, 2004). In this metaphor, the pipeline represents the educational path that leads to a teaching career, beginning at entry into schools in kindergarten. There are critical junctures along this path—completion of high school, enrollment in post-secondary education, enrollment in a program of teacher education, completion of college, and completion of requirements for a teaching certificate. The shortage of minority teachers can be attributed to a sizeable loss of students of color at each critical juncture in the pipeline.

Historically, students of color have had significantly lower high school completion rates than White students. In 2000, for instance, the high school completion rate was 91.8 percent for White students, compared to 83.7 percent for Blacks and a dismal 64.1 percent for Hispanics (NCES, 2001). Such losses of minority students at this critical juncture in the education pipeline substantially reduce the pool of eligible candidates of color for higher education, especially among Hispanics.

Of those who complete high school and pursue a post-secondary education, most begin by enrolling in two-year colleges (Chronicle of Higher Education, 1999). To become teachers, they must transfer to four-year colleges, but a disappointingly small proportion of them do so (Palmer, 2005). A major part of the problem is that articulation agreements between two- and four-year colleges tend to lack clarity regarding the transfer of courses, especially as it pertains to teacher education. Consequently, transfer students often find themselves having to repeat courses they completed at the junior college. The necessity of additional coursework prevents many transfer students of color from going into teacher education (Villegas & Clewell, 1998).

Ironically, another barrier to increasing the number of teachers of color is the fact that in the early 1970s, professional options outside the field of education began to open up to minorities as a result of the Civil Rights movement. Because of other options, teacher education programs have experienced increasing difficulty attracting students of color from the traditional college-bound pool. This population has defected in large numbers to non-education fields that offer graduates the promise of higher salaries and greater prestige, such as business, engineering, and the health professions (Carter & Wilson, 1992). According to Gordon (1997), middle-class minority parents—especially within the African American and Asian communities—have contributed to this exodus by encouraging their children to pursue lucrative careers that command more status than teaching.

Even when efforts to recruit students of color into teacher education succeed, they are insufficient. If the representation of people of color in the teaching profession is to grow, institutions of higher education must retain the new recruits through graduation. Unfortunately colleges and universities, especially predominantly White ones, have a dismal record on the retention of minority students. This is particularly true for first-generation students from low-income backgrounds (Seidman, 2005). Factors contributing to the low retention rates for minorities in higher education include the lack of attention given to cultural diversity on most college/university campuses, insufficient academic and social support, and the resulting sense of alienation that many minority students experience in predominantly White colleges/universities (Feagin et al., 1996). Thus, even when teacher education programs are successful in recruiting minority students, attrition within this group significantly constrains the pool of candidates of color for the teaching profession.
Increased use of teacher testing since the 1980s is another factor restricting the flow of people of color through the teacher education pipeline. In 1980, for example, only 15 states required prospective teachers to pass a standardized test to be certified. Now 43 states have testing requirements for initial certification. Because the passing rates of candidates of color on standardized tests tend to be lower than those of their White counterparts, the teacher testing movement has resulted in the exclusion of disproportionately large numbers of people of color from the profession (Memory et al., 2003). Given the limited and contested evidence regarding the predictive validity of existing teacher tests (Haney et al., 1999; Melnick & Pullin, 2000), the intensified use of teacher testing associated with the No Child Left Behind Act of 2001 raises serious legal questions. While we believe that the quality of public education needs to be improved, we fear that the narrow definition of teacher quality and accompanying methods for identifying “highly qualified teachers” inherent in NCLB will result in a further whitening of the teaching force.

The factors discussed above have seriously limited the representation of people of color in teaching just as the representation of students of color in elementary and secondary schools has grown significantly. In response to the widening demographic gap between teachers and their students, a number of school districts, colleges and universities, and state departments of education have adopted minority recruitment policies and programs over the past 15 years. Such policies and programs seek to expand the pool of potential teachers of color by focusing recruitment efforts on non-traditional candidates and offering new recruits support services specifically designed to increase their completion of high school, enrollment and retention in college, completion of teacher education programs and the requirements associated with a teaching certificate, and placement in teaching positions. These are some the most frequently used strategies: targeting middle and high school students to prepare them for college while motivating them to pursue a teaching career; creating career ladder programs for paraeducators; developing clear and strong articulation agreements between two- and four-year colleges to facilitate the transfer of students of color into teacher education at four-year institutions; and creating programs of alternative routes to certification to attract career switchers and retirees from other professions. A brief description of each of these strategies follows.

Early recruitment programs identify potential minority candidates before their senior year in high school, often as early as middle school, and involve them in interventions designed to foster their interest in teaching and enhance their preparation for college. These programs entail partnerships between the school districts in which the students are enrolled and teacher education programs of nearby colleges. Among the variety of strategies used to attain their dual goals are the following: Future Educators Clubs; introductory teacher education courses that offer college credit to high school juniors and seniors; mentor teachers and invited speakers who provide students with information about the teaching profession and inspire them to pursue a college education and become teachers; summer programs that give students intensive teaching experiences as well as academic support; and work study programs in which minority students in the upper high school grades tutor young children in community programs (Recruiting New Teachers, 1997).

Paraeducator-to-teacher programs also entail collaboration between teacher education programs and neighboring school districts. Given that many paraeducators are of racially and ethnically diverse backgrounds and have extensive teaching experience, they are a strong pool from which to draw candidates of color for teaching. In initiatives of this type, paraeducators continue to work in their salaried positions and enroll in courses each semester toward the completion of requirements for teaching certification and, in
most cases, for a bachelor’s degree as well. Since the ultimate goal of these programs is to place graduates in permanent teaching positions, active involvement of partner district staff in the selection of participants is essential. The teacher education curriculum is specifically designed to help participants explore the connection between the theories studied in college/university classes and their practice in classrooms as paraeducators. Tuition assistance is a key feature of these programs. In addition, participants receive a wide variety of support services, including preparation for certification exams and mentoring to assist them with their teaching (Clewell & Villegas, 2001; Villegas & Clewell, 1998).

Partnerships between two- and four-year colleges are another effective strategy for recruiting and preparing more teachers of color. As mentioned above, most students of color who pursue a college education first matriculate into two-year colleges. Critical to these partnerships is a dual admissions system that guarantees two-year college students entry into selected teacher education programs at a four-year institution if they complete the specified course of general studies successfully. Effective partnerships require that faculties of the two- and four-year colleges be involved in decisions regarding the general education courses that will transfer. Students also receive counseling to facilitate a smooth transfer (Hudson et al., 2002).

Alternative certification programs target for recruitment individuals who already hold a bachelor’s degree in a non-education field, including midlife career changers, retirees from professions outside education, and emergency certified or substitute teachers. Alternative route programs that have successfully prepared people of color for teaching provide recruits with rigorous training in pedagogy and intensive classroom support during their first year as teachers (Clewell & Villegas, 1999).

Have existing minority teacher recruitment programs succeeded in increasing the diversity within the ranks of public school teachers? The data summarized in Table 33.1 suggest progress has been made toward this end. The table provides information about the racial/ethnic distribution of public school teachers taken from the National Center for Educational Statistics’ last three administrations of the Schools and Staffing Survey. As shown, the overall composition of the teaching force was more diverse in 1999–2000 than in 1987–1988. Specifically, teachers of color accounted for 15.7 percent of the teaching force in 1999–2000, up from 13.1 percent twelve years earlier. However, the gains were not evenly distributed across the different minority groups. While the fraction of American Indian/Alaska Native teachers remained at about the same level, there were gains in the percentages of Hispanic and Asian/Pacific Island teachers. In contrast, the share of African Americans declined from 8.2 percent in 1887–88 to 7.4 percent in 1993–94, where it has held steady since (NCES, 1995; 2002). We suspect that in addition to the factors discussed above, the waning presence of African American teachers is

influenced by a large wave of retirements within this group. Clearly, the diminishing representation of African Americans in teaching is an issue that demands immediate attention and further investigation.

A review of information pertaining to the racial/ethnic backgrounds of new teachers—that is, those who have been teaching for three years or less—also affirms the success of ongoing minority recruitment efforts. Table 33.2 summarizes the relevant information for the 12-year period between 1987 and 1999. As shown, 13.0 percent of all new teachers were of minority backgrounds in 1987. That figure rose to 17.4 percent in 1993. Six years later, it reached a high of nearly 23 percent. According to Shen (1998), this increase in diversity among new teachers can be attributed in large measure to the growth of programs that offer alternative routes to teaching, the path of choice for most people of color since 1990.

The favorable trend noted above suggests that the goal of diversifying the teaching force appreciably is attainable. Even so, it will require more than active recruitment. Focused attention must also be given to issues of retention. As Ingersoll (2004) argues persuasively, the inability of school systems to retain teachers of all backgrounds contributes significantly to the short supply of educators in the United States. Because the overwhelming majority of teachers of color are placed in hard-to-staff urban schools (Villegas, 2005), they are especially vulnerable to attrition.

Urban schools are plagued by chronic teacher shortages. To cope with this problem, school officials often resort to a strategy of moving staff around for coverage, even if this results in assigning teachers to teach subjects that do not match their academic preparation. A second strategy used frequently by school officials is to increase the size of classes in order to reduce the number of teachers a school requires. Because these administrative practices intensify the work load of teachers, they increase the odds of attrition among those affected. Unfortunately, teachers of color are more likely than their White colleagues to receive out-of-field assignments for at least a portion of their time, and also to have large classes (Villegas, 2005). The relevant information for the 15-year period between 1986 and 2001 is summarized in Table 33.3. As shown, out-of-field assignments increased for minority teachers from 1986 through 2001. Particularly problematic is the change noted from 1996 to 2001, when misassignments spiked from 23 to 30 percent among minorities. In contrast, misassignments held steady over the years at 16 to 17 percent among White teachers. The table also shows dramatic differences between the average size of classes taught by minority and White teachers in departmentalized settings. Among minorities, the average class size ranged from a low of 30 students in 1991 to a high of 46 students in 1996. Even though class size decreased for minorities in 2001, the 38-student average observed that year is far from optimal. The average class size for White teachers was never higher than 29 students during the same 15-year period.

The data presented above suggest that without strong mentoring programs for novice minority teachers and improved working conditions in urban schools—where the majority of these teachers are employed—gains made toward diversifying the teaching force through recruitment could be negated by the premature loss of teachers of color through

attrition. This concern is magnified by the recent growth of minority teachers in the novice category. Research shows that the highest attrition from teaching tends to occur among the most junior teachers, partly as a result of difficulties in adjusting to the profession.

ATTENDING TO THE PREPARATION OF CANDIDATES OF COLOR

To maximize the benefits that can be derived from a diverse teaching force, we must go beyond issues of recruitment and retention and attend to the preparation of candidates of color. Unless minority candidates are appropriately prepared to use the unique qualities and perspectives they bring to teaching, the yield of those resources will be limited at best. More to the point, it would be unfair to expect people of color to help narrow the racial/ethnic achievement gap without the benefit of professional growth experiences that enable them to use their cultural knowledge and expertise in teaching. Unfortunately, teacher education programs are evading their responsibility in this matter (Montecinos, 1994; 2004; Rios & Montecinos, 1999).

While there has been some progress over the past 15 years toward making the teacher education curriculum more multicultural, the intended beneficiaries of those efforts have largely been White pre-service teachers (Cochran-Smith, 1995; Knight, 2002; Montecinos, 2004; Rios & Montecinos, 1999; Sheets & Chew, 2002). Part of the problem is that empirical studies of multicultural teacher education conducted to date have tended to focus on approaches for helping White pre-service teachers—who represent the overwhelming majority of the pre-service teacher population—to teach students who are racially and ethnically different from themselves. This literature pays scant attention to strategies that teacher educators might use to help candidates of color build on the unique strengths they bring to teaching—that is, their knowledge about students of color and their insiders’ experiences as members of minority groups—to shape their pedagogy and define their roles as teachers. Thus, candidates of color are left to figure out on their own how best to use their cultural knowledge and life experiences in classrooms and schools. Lacking this preparation, teachers of color—most of whom teach in school districts with high minority enrollments—become increasingly vulnerable to attrition (Parker & Hood, 1995).

Source: NEA, 2003
In the remainder of this section, we present three strategies that could make programs of teacher education more responsive to minority teacher candidates: (a) preparing teachers of color to be agents of change; (b) preparing teachers of color to be culturally responsive; and (c) creating a safe environment conducive to critical dialogue.

Preparing teachers of color to be agents of change

In spite of progress over the years toward making schools more equitable and just, schools continue to place poor and minority students at a learning disadvantage. Eradicating the deeply ingrained inequities demands a cadre of teachers who understand the political nature of schools and teaching, and who are adept at identifying biases in their own teaching and skilled in reconstructing the culture of their classrooms to make them fully inclusive. Compared to their White peers, people of color are more likely to enter teacher education with the attitudes and dispositions needed to become agents of change. They know from experience what it is like to be a person of color in the United States. Most come from economically poor backgrounds. If they are not poor themselves, they often have close relatives or friends who are. They also know from first-hand experience that schools are not level playing fields on which all students can prove their merit. They understand that built into virtually every school system are practices that put minority students at a decided disadvantage (Kauchak & Burback, 2003; Rios & Montecinos, 1999; Su, 1997; Wilder, 1999). If properly tapped by teacher educators, these experiences and insights—and the sociocultural consciousness they engender—could serve as a powerful resource for cultivating commitment on the part of minority candidates to engage in the future reconstruction of schools. In fact, we believe that the addition of large numbers of teachers of color who are well prepared to act as agents of change represents our best chance to make schools more democratic and just.

To use minority teacher candidates’ understanding of inequalities in schools and society for political change, teacher education programs must address thorny issues of racism and ethnocentrism openly. Unfortunately, many programs are silent on these topics or address them only in simplistic and superficial ways. Among programs that promote more thoughtful discussions of issues related to social inequalities, usually in the one required multicultural education course, the focus generally is on helping White teacher candidates recognize that schools and society are not neutral and that “white privilege” does exist. The intense focus on the needs of White candidates leaves little or no space in the curriculum for students of color (who are already well aware that racism and ethnocentrism are ingrained in our society) to develop the skills they need to respond constructively to the inequities they will encounter in schools as teachers. This gap in the curriculum seriously undermines the gains that could be derived from ongoing efforts to diversify the teacher workforce.

Preparing teachers of color to be culturally responsive

Minority recruitment policies assume that teachers of color will be effective teachers of students of color because they are knowledgeable about those students’ cultures. While the cultural knowledge people of color bring to teaching gives them an advantage over their White colleagues in teaching students of color, it would be simplistic to assume that people of color can become culturally responsive educators on their own. To accomplish this, they need a framework that makes the connection between culture and pedagogy explicit. A constructivist conception of learning could serve as such a framework (Villegas & Lucas, 2002)
From a constructivist perspective, learning is seen as a process by which students generate meaning in response to new ideas and experiences they encounter in school. In this interpretive process, they use their prior knowledge and beliefs to make sense of new input (Glaserfeld, 1995). This suggests that learners’ preexisting knowledge, derived from personal and cultural experiences, gives them access to learning. To ignore the experiences that children bring to school is to deny them access to the knowledge construction process. Thus, a salient role of the teacher is to help students connect learning in school to their everyday life experiences outside school.

Guided by this theory of learning, a culturally responsive teacher uses such practices as the following: activating students’ prior knowledge and beliefs related to the topic being studied; building instruction on students’ interests in order to engage them in learning; selecting instructional materials that are relevant to students’ experiences; making use of pertinent examples and analogies drawn from students’ lives to introduce or clarify new concepts; building on students’ linguistic resources; creating different paths to learning by using varied instructional approaches; managing the classroom in ways that take into consideration cultural differences in interaction styles; and using a variety of assessment strategies to maximize students’ opportunities to demonstrate what they know about the topic at hand in ways that are familiar to them (Villegas & Lucas, 2002).

This framework or a similar one would enable candidates of color to envision a variety of ways in which to use their knowledge of minority cultures for pedagogical purposes. To facilitate the development of culturally responsive teaching practices, teacher educators could ask minority candidates to read about and discuss the practices of effective teachers of color (see for example Irvine, 2002; Monzó & Rueda, 2001). Teacher educators also need to support minority teacher candidates in applying principles of culturally responsive teaching in culturally diverse classroom settings.

If a teacher does not have a firm grasp of the subject being taught, the teacher’s ability to help students make connections between their cultural backgrounds and the content of the lesson will be limited. To be successful, all teachers, regardless of their backgrounds, need to have a deep understanding of the concepts in their respective academic disciplines and how those concepts relate to one another; the structures, principles, and nature of discourse in those disciplines; and the role that those disciplines play in society. Whatever the candidates’ ethnicity, the preparation of culturally responsive teachers involves providing a strong foundation in the subject matter they will teach. Because minority teacher candidates tend to be the products of urban elementary and secondary schools that often provide a watered-down academic experience, many are likely to need additional support in their disciplinary majors. Colleges and universities that do not offer such support are not seriously committed to diversifying the teacher workforce, even if their mission statements and policies claim otherwise.

Creating a safe environment conducive to critical dialogue

A theme that emerges from studies on the experiences of minority candidates in teacher education programs, especially at predominantly White institutions, is the profound sense of alienation this population commonly experiences (Bennet et al., 2000; Cochran-Smith, 2000; Sheets & Chew, 2002). Such alienation stems from what Sleeter (2001) aptly describes as an “overwhelming presence of whiteness.” Candidates of color constitute a small fraction of the enrollment in teacher education classes. They encounter relatively few faculty members who are like them racially and ethnically, and are generally exposed to a curriculum that ignores their strengths and needs. In this context of overwhelming whiteness, it is not surprising that minority candidates frequently report
feeling unsafe in class, especially when discussing issues of diversity with peers and faculty
whom they perceive as insensitive to these topics and disinterested in hearing what they
have to offer. The resulting sense of alienation increases the odds of minority candidates’
attrition from teacher education programs. From another perspective, the withdrawal of
students of color from in-class discussions deprives everyone, including White students,
of opportunities to engage in the critical dialogue they need to become agents of change.

To retain students of color through program completion, teacher educators must find
ways of building a learning community in which minority candidates feel both safe and
respected. This goal can be attained by creating a space in the curriculum (e.g. a seminar)
for students of color to talk openly among themselves about issues they consider important
to their own professional development as teachers (Bennett et al., 2000). In such a
seminar, for example, students of color might reflect on characteristics they bring to
teaching that are unique and inherently of value in our increasingly diverse elementary
and secondary schools (Dillard, 1994).

Teacher educators also need to find ways of involving students of color in productive
conversations across racial/ethnic lines in classrooms where they are a small minority, if
not the only one. Unless steps are taken toward this end, the overwhelming number of
White students in teacher education classes can drown out the voices of even the most
outspoken students of color. Such conversations are necessary if teacher educators are to
prepare candidates of all racial/ethnic backgrounds to develop the skills required to
exchange ideas across differences in professional contexts and to build coalitions for
change (Knight, 2002). To this end, teacher educators will need to articulate clear rules
for discussing differences in a manner that is respectful of all. These conversations would
benefit from having teacher educators pose critical questions to the group about who
speaks or is silent in the program, in what settings, and on which topics. Clearly, to
orchestrate these potentially difficult dialogues, teacher educators will require consider-
able professional development themselves. Such conversations are not likely to occur in
the absence of faculty diversity.

CONCLUSION

As women of color, we (the authors) cannot claim to be uninterested in the subject
examined in this chapter. We acknowledge that our own personal and professional
experiences suggest that the presence of teachers of color makes a difference in the
learning of students of color. However, as educational researchers, we also know that our
own experiences do not constitute evidence for drawing conclusions about the experiences
of others. Therefore, we began the review of the literature for this chapter with a
commitment to follow the empirical evidence wherever it would lead us. Having exam-
ined the empirical literature, we are now convinced there is sufficient evidence to suggest
that teacher race and ethnicity do matter in the education of students of color. Our
review does not support a color-blind perspective on the relationship between teacher
and student race/ethnicity.

While the available research is insufficient to provide a clear understanding of exactly
how and why teacher race/ethnicity matters, it allows us to draw some tentative conclu-
sions. Teacher perceptions and expectations of students play a critical role in the racial
dynamics of classrooms. There is substantial evidence that these factors influence the
opportunities teachers create for students to learn. Because teachers of color tend to have
more favorable (or at least more neutral) views of students of color, it is likely that they
structure their teaching in ways that are more supportive of student achievement. In
effect, they protect students of color from the potentially pernicious effects of negative stereotyping and low expectations. Research also suggests that teachers of color who are considered effective by parents and principals use their cultural knowledge to help students of color build bridges to learning and tend to establish relationships of care and trust with their students. Clearly, teachers who know their students well and are adept at communicating with them in culturally appropriate ways are better able to engage students in the learning process. While the existing research suggests that these are two ways in which teacher race/ethnicity has a positive impact on the learning of students of color, there is a need for further research to test these conclusions and provide a more nuanced understanding of the roles played by and the impact of teacher race/ethnicity.

The evidence that teacher race/ethnicity can make a positive difference in the learning of students of color supports efforts to increase the number of teachers of color. In this chapter we reviewed minority teacher recruitment policies and programs adopted by school districts, institutions of higher education, and state education departments over the past 15 years and their impact on the racial/ethnic composition of the teacher workforce. Because the shortage of teachers of color derives from the loss of students of color at different junctures along the educational pipeline, recruitment initiatives have been developed to help more minority candidates qualify for postsecondary education in general and for teaching in particular. Recruitment programs target different pools of potential teachers, including pre-college students, community college students, paraprofessionals, mid-life career changers, and retirees from other professions. Evidence regarding the success of such efforts is promising with regard to increasing the number of Hispanic and Asian teachers, but it is less promising regarding Black teachers. The proportion of teachers who are Black is decreasing and is likely to continue to do so as large numbers of older Black teachers reach retirement age. Alternative routes for bringing mid-career-changing adults into teaching appear to offer the best hope for increasing the number of Black Americans in the profession.

Regardless of the success of some recruitment efforts, recruitment alone is woefully inadequate as a strategy for increasing the diversity of the teaching force. The almost exclusive focus on recruitment efforts is shortsighted. Unless we want to perpetuate a revolving door for teachers of color, we must turn our attention to retaining them once they have entered the profession. Research is needed to identify factors that influence teachers of color to leave or to remain in the classroom. A number of factors discussed in the literature seem to merit exploration. One, for example, is the fact that a large proportion of teachers of color are employed in urban schools, where conditions tend to interfere with teaching and learning. There is also evidence that teachers of color are more likely to have large classes and to be assigned to teach in fields or disciplines for which they are unprepared. The more responsible and committed a teacher is, the less willing she or he may be to continue working in a situation where success seems impossible. In addition to these issues, all aspects of the retention of teachers of color should be explored empirically.

Similarly, more attention should be given to providing relevant preparation for prospective teachers of color and to studying such preparation. Culturally responsive teacher education is as essential as culturally responsive teaching in K-12 schools. A great deal of attention has been given to designing teacher education so that the large majority of future teachers who are White will be prepared to teach culturally and linguistically diverse students—and rightfully so. However, teachers of color also need preparation that is designed specifically for them. A person of color cannot be expected to know how to use his or her cultural knowledge for pedagogical purposes without being taught how
to do so. Teachers of color who are not adequately supported in learning how to use their insights and experiences may make less difference in the lives of their students than they could, and they may be among those who do not remain in teaching. This is another area for research.

We began this chapter by suggesting that a more diverse teaching force might contribute to the reduction of the achievement gap. Evidence we reviewed generally supports the argument that teachers of color can promote the learning of students of color. However, as we pointed out earlier, the strategy must involve much more than simply increasing the number of teachers who reflect the diversity of the student population. A comprehensive effort is needed to recruit, prepare, and retain people of color in teaching. In addition, a multifaceted research agenda must be undertaken to gain a better understanding of how and why teacher race/ethnicity makes a difference for students and of how a diverse teaching force can be successfully recruited, prepared, and nurtured.

NOTE

1 Murname and Levy (1996) suggest that to qualify for a middle-class job, 17-year-olds must attain a scaled score of 300 or higher in NAEP tests of reading and mathematics. That is, they must reach the basic skills proficiency level designated by the 300 scaled score. In 1999, 70 percent of White 17-year-olds performed at or above the basics skills level in reading and mathematics, compared to only 27 percent of Black students and 38 percent of Hispanic students (Lee, 2002).

REFERENCES

INTRODUCTION

Until recently, little thought was given to preparing regular classroom teachers to teach students who speak native languages other than English. English language learners (ELLs) have been expected to develop proficiency in English before they enter the mainstream classroom by taking classes taught by specialists in English as a second language (ESL) or, in some contexts, participating in programs that allow them to learn in their native language while developing English proficiency. However, in reality, many ELLs have no access to instruction by specially-prepared teachers. ELLs who are not fully proficient in English are placed in classes with teachers who are not prepared to teach them, and they are expected to “pick up” English—along with academic content and skills—by swimming (rather than sinking) in the mainstream. As the number of ELLs across the country continues to grow (Kindler, 2002), the problematic nature of this practice becomes increasingly evident. Even after spending time in special classes, most ELLs enter the mainstream needing some extra support to have full access to academic content. The failure to prepare all teachers to provide the support needed by ELLs has had negative repercussions for generations of young people who have entered regular classrooms (Grinberg et al., 2005; Marquez-Lopez, 2005).

In this chapter, we examine the literature on the preparation of non-specialist classroom teachers (hereafter referred to as classroom teachers) to teach ELLs. We see this chapter as closely related to the literature on preparing culturally responsive teachers (e.g. Cochran-Smith et al., 2004; Gay, 2000; Grant & Secada, 1990; Grinberg et al., 2005; Ladson-Billings, 1995; Villegas, 1991; Villegas & Lucas, 2002). However, this review departs in major ways from that literature and from previous reviews of the literature on the preparation of teachers for diverse populations (see, for example, Hollins & Guzman, 2005). While the existing literature tends to treat linguistic and cultural diversity as one largely undifferentiated set of factors and to treat language as one of many aspects of culture, we explicitly distinguish linguistic diversity from other types of diversity, focusing squarely on linguistic issues. We pull the threads related to language that get lost in the larger fabric of culturally responsive teacher preparation and bring them to the surface. We also show why more attention must be devoted to preparing all teachers to teach ELLs. It is time that we stop subsuming the preparation of classroom teachers to teach English language learners within more general considerations of the preparation of teachers for diverse populations. This review is an attempt to move the field of teacher education away from that practice.
The literature on the preparation of classroom teachers to teach ELLs—especially reports of rigorous empirical research—is sparse, as noted by August and Hakuta (1997), Merino (1999), and Zeichner (2005). In this chapter, we concentrate on literature related to the pre-service and in-service preparation of classroom teachers to teach ELLs published within the last 20 years. Our selection of empirical literature was guided by the principles of scientific inquiry articulated by Shavelson and Towne (2002). We identified 17 relevant empirical studies—eight that focused directly on the preparation of classroom teachers to teach ELLs and nine that examined some aspect of the education of ELLs in mainstream classrooms. While we made every effort to identify the relevant empirical literature, we did not privilege empirical evidence; we also included literature that provided well-developed arguments and assertions grounded in philosophical, historical, sociological, and wisdom-of-practice traditions. We included articles in peer-reviewed journals, book chapters, reports prepared for government agencies and professional organizations, and conference presentations.

We believe the diversity of genres and publication types we have used in preparing the chapter is warranted. First, very little empirical research on preparing teachers to teach ELLs has been conducted, particularly on preparing regular classroom teachers. Second, and in our view more importantly, empirical evidence alone cannot explain what education is or should be. Because of the importance of values and the wisdom of practice in educational decision making—especially with regard to subordinated groups such as ELLs and their families—we considered conceptual, theoretical, and policy literature as well as reports of empirical research in preparing this chapter.

Limited as it is in many respects, the literature we reviewed could have led us in a number of directions in our efforts to give the material structure and coherence. However, our iterative process of analysis and synthesis of the literature led us to address three questions. First, to establish the importance of preparing classroom teachers to teach ELLs—and to problematize the marginal treatment of such preparation in mainstream teacher education literature—we begin by explicitly addressing the following question. Why should we devote attention and resources to preparing all teachers to teach ELLs? Our answers come from demographic, empirical, and conceptual literature. Second, to construct a foundation for curriculum and instruction to prepare all teachers to teach ELLs, we ask what teachers need to know and be able to do to teach ELLs successfully. We draw on empirical and theoretical literature to identify language-related experiences, attitudes, beliefs, knowledge, and skills that are particularly relevant for classroom teachers of ELLs. Finally, we ask: What do we know about how classroom teachers are being prepared to teach ELLs? Drawing on empirical and descriptive literature, we describe structural and process strategies for the pre-service and in-service preparation of classroom teachers to teach ELLs. We conclude with a brief overview of key issues and recommendations for policy and research.

WHY MORE ATTENTION SHOULD BE GIVEN TO PREPARING CLASSROOM TEACHERS TO TEACH ELLs

While the literature on preparing teachers to teach culturally diverse student populations often mentions language as a factor to consider, language-related issues are seldom addressed in depth. Diversity is frequently treated as a general and undifferentiated concept (Goodwin, 2002). Commonly used phrases such as culturally and linguistically diverse students tend to obscure the particular linguistic issues relevant to teaching ELLs. A number of arguments have been made in support of increased attention to those issues
in preparing all teachers to teach ELLs. Because of the invisibility of this issue, we believe an elaboration on these arguments is warranted.

The increasing likelihood that classroom teachers will have ELLs in their classes

The demographic argument is perhaps the most compelling. The increasing number of ELLs in schools across the country means that many classroom teachers who never expected to have ELLs in their classes are finding them there. Between 1979 and 2003, the proportion of 5- to 17-year-olds in the United States who spoke a language other than English grew by 161 percent (from 8.5 percent to 18.7 percent), and the proportion who reported speaking English less than “very well” grew by 124 percent (from 2.8 percent to 5.5 percent) (NCES, 2005). Between 1990–91 and 2000–01, the LEP enrollment in U.S. schools increased by 105 percent, compared to a relatively small 12 percent overall enrollment increase (Kindler, 2002). An estimated 4 million LEP students (8.4 percent of all students) enrolled in U.S. schools in 2001–02—an increase of 72 percent over 1992 (Zehler et al., 2003). It is projected that, by 2030, 40 percent of the K-12 age population in the U.S. will be children whose first language is not English (AACTE, 2002). While the growth in the Asian population (from 2.8 percent of the U.S. population in 1986 to 4.1 percent in 2000 [NCES, 2002d]) contributes to this trend, the increase in the Hispanic population is the most influential factor. Hispanic students accounted for 6 percent of public school enrollment in 1972, 11 percent in 1986, and 17 percent in 2000 (NCES, 2002a). Half of Hispanic immigrants are under age 27, and 20 percent of all children under the age of 5 years in the U.S. is now Hispanic (Files, 2005). In 1999, 71 percent of Hispanic children ages 5–17 spoke a language other than English at home, compared to 4 percent of White and Black children (NCES, 2003a).

Although ELLs continue to be concentrated in a few states and metropolitan areas, their presence is also being felt in other areas across the U.S. These changes are noteworthy because the presence of even a few ELLs can have a significant impact on schools and teachers with no relevant prior experience. According to Zehler and associates (2003), 43 percent of districts and 50 percent of schools in the U.S. enroll one or more LEP students. Hopstock and Stephenson (2003) reported that 43 percent of all K-12 teachers in 2001–2002 worked with at least one LEP student, up from 15 percent ten years earlier. This shift also means that LEP students are spread across more classes and that the diversity of English language abilities among students in mainstream classes has increased.

Besides the statistical fact that ELLs constitute a growing proportion of the U.S. student population, there are other reasons for their increasing numbers in mainstream classes. First, as a result of political opposition to the use of languages other than English that began in the 1980s, the number of bilingual programs and therefore bilingual teachers has diminished (Crawford, 1992; Rumberger & Gándara, 2004). This means that classroom teachers are increasingly responsible for providing the majority of instruction to ELLs (Menken & Antunez, 2001). Second, the passage of the No Child Left Behind (NCLB) Act in 2001 contributed to this trend by requiring that LEP students be tested in English after they have been in the U.S. for three years or longer. The urgency of trying to prepare these students for standardized tests in English within three years has pushed many districts to speed up the process of enrolling them in mainstream classes (Cornell, 1995) and put greater pressure on the teachers of those classes (Wong-Fillmore & Snow, 2005). Third, the fact that placing ELLs in mainstream classes is less costly than providing special classes provides additional impetus for this process (Cornell, 1995).
For all these reasons, classroom teachers may spend more time with ELLs overall than ESL and bilingual specialists do and they therefore have a major impact on their achievement. Given this reality, mainstream teachers must be prepared to teach ELL students.

**Special challenges faced by classroom teachers with ELLs in their classes**

The second argument for preparing classroom teachers to teach ELLs is that teachers of ELLs face a number of special challenges for which current pre-service and in-service teacher education programs generally do not prepare them. Perhaps the most obvious challenge is the need to teach both content and English language to students who are not native speakers of English. In an influential essay, Wong-Fillmore and Snow (2005) make the case that teachers need extensive language-related knowledge and skills to successfully play their roles as communicators, educators, evaluators, educated human beings, and agents of socialization. They argue that, given few U.S. elementary and secondary schools today require the formal study of the structure of English or the study of foreign languages, most classroom teachers are not equipped to teach ELLs successfully. Other special challenges of teaching ELLs identified by teachers in 22 California districts (Gándara et al., 2005) included difficulty communicating with students and their families, insufficient time to teach English and subject matter to ELLs, missed class time for students attending pull-out ESL classes, widely varying levels of English proficiency and academic preparation of ELLs in one class, lack of appropriate instructional materials, and general lack of teacher preparation.

Clearly some of these challenges cannot be addressed through teacher preparation, but most of them can be. Classroom teachers’ lack of knowledge about language, difficulties communicating with ELLs and their families, and inability to successfully address widely differing linguistic and academic skills in one class are exacerbated by common myths and misconceptions about ELLs and about learning a second language (Walker et al., 2004)—all of which lead to the mis-education of ELLs. Appropriate preparation can directly address such misconceptions and ameliorate many of the challenges. Without preparation, classroom teachers are left to sink or swim, much as the ELLs in their classes are expected to do.

**The inadequacy of the current preparation of classroom teachers to teach ELLs**

The great majority of U.S. teachers—74 percent of them in 2000—have had no recent professional development for working with ELLs, and most teachers who have participated in relevant professional development activities have spent only a few hours in those activities (NCES 2002c). Particularly troubling is the fact that between 1998 and 2000, the percent of all teachers who had participated in relevant professional development decreased from 31 percent to 26 percent (NCES, 1999, 2002c). A more promising indicator is that participation in professional development varies by minority enrollment and number of ELLs in teachers’ classes. Appropriately, the larger the minority student enrollment in districts (NCES, 1997, 1999) and the more ELLs in teachers’ classes (at least in California) (Gándara et al., 2005), the more likely teachers are to have had at least some professional development related to teaching ELLs. Still, we cannot be certain about the quality of such professional development or about the sustainability and support available for teachers after such experiences.
The extent of pre-service preparation of teachers is another aspect of their inadequate preparedness. Less than one-sixth (17 percent) of schools, colleges, and departments of education report that they require a course focused on issues related to ELLs (Menken & Antunez, 2001). With regard to teachers’ level of education, the 1999–2000 Schools and Staffing Survey (NCES, 2002b) found that the higher the proportion of LEP students in a school, the fewer teachers there were with master’s degrees.

Teaching experience and proficiency in a second language are other indicators of how well-prepared teachers are to teach ELLs. While available data make it difficult to draw firm conclusions about the experience of teachers of ELLs, the 1999–2000 Schools and Staffing Survey indicated that public and private schools “with the highest percentages of limited-English-proficient (LEP) students were more likely to employ beginning teachers than schools . . . with the lowest percentages of LEP students” (NCES 2003b, p. 59).

We were not able to identify any agency or organization that regularly collects data on the native languages of teachers or the extent to which teachers have studied foreign languages.

Teachers’ perceptions of their preparedness to teach ELLs offer a different sort of insight about the adequacy of their preparation. The evidence suggests that large proportions of classroom teachers do not feel prepared to successfully teach ELLs. A 1998 U.S. Department of Education survey found that 54 percent of teachers taught “limited English proficient or culturally diverse students,” but only 20 percent of those teachers felt very well prepared and 17 percent felt not at all prepared to meet their needs (NCES, 1999). Teachers in schools with higher minority enrollments and teachers who had participated in relevant professional development reported feeling more prepared than others. A study of California teachers also revealed that teachers with more pre-service and in-service preparation were more confident in their ability to teach ELLs (Gándara et al., 2005). A study of the attitudes, beliefs, and knowledge of teachers in a medium-sized (15,000 students) Midwestern school district, one-third of whose students were identified as LEP, complements the national and California-based studies (Karabenick & Noda, 2004). The authors obtained survey data from 729 teachers (98 percent of the total), 88 percent of whom had had ELLs in their classes. They concluded that teachers did not have a clear understanding of second language acquisition (including the role of the first language in learning a second language), the difference between oral communication proficiencies and cognitive- academic language proficiencies, bilingualism, and approaches to bilingual education.

Given the increasing numbers of ELLs in mainstream classrooms and the special challenges faced by their teachers, it is incumbent upon teacher educators to provide all teachers with the necessary preparation for teaching ELLs. If teachers are not appropriately prepared to provide the linguistic, academic, and personal support needed by ELLs, then these students are being denied their civil rights (AACTE, 2002)—that is, they are being denied instruction they can understand and from which they can learn. Some of the evidence presented above is promising with regard to the potential impact of professional development. However, overall, it is clear that teachers are not well prepared to successfully educate ELLs. In the next section, we turn to what well-prepared teachers need to know and be able to do.

EXPERIENCES, ATTITUDES, BELIEFS, KNOWLEDGE, AND SKILLS FOR TEACHING ELLs

While there is little literature focused on approaches and strategies for preparing classroom teachers to teach ELLs, some attention has been given to identifying the knowledge,
skills, and dispositions teachers need to instruct this student population (e.g. August & Hakuta, 1997; García, 1993, 1996, 1999; González & Darling-Hammond, 1997; Milk et al., 1992; Wong-Fillmore & Snow, 2005). This section of the chapter reviews that literature, which draws on the wisdom of practice and theoretical work as well as empirical research. We remind readers that our focus is on those language-related qualities particularly important for classroom teachers of ELLs that too often are obscured in discussions on preparing culturally responsive teachers. We are purposefully silent about the many essential qualities that apply to all good teachers (e.g. deep content knowledge, pedagogical content knowledge, reflection). As shown in Figure 34.1, we have organized the language-related qualities into four broad categories—experiences, attitudes and beliefs, knowledge, and skills.

Language-related experiences teachers need for teaching ELLs

Teachers, like everyone else, are shaped by their experiences. Although it is beyond the scope of this chapter to elaborate on the relationship between personal experience and learning to teach (see Feiman-Nemser & Buchmann, 1986; Grinberg, 2002), suffice it to say that teachers’ professional perspectives and actions are influenced by what they have seen, heard, and done in their lives. Below we consider two types of language-related experiences—studying a foreign/second language and having contact with people who speak languages other than English—that could promote teachers’ deep connections with their ELLs.

Studying a foreign/second language

The experience of studying a second language contributes to the preparation of teachers to teach ELLs by giving them insight into the language learning process and the experiences of their students—even if they are not fully fluent in the language and even if they have not studied the particular languages spoken by their students (Baca & Escamilla, 2005; Wong-Fillmore & Snow, 2005). This personal experience can “open teachers’ eyes and hearts” to the language-learning experiences of ELLs (Nieto & Rolón, 1997, p. 113).
Evidence of the benefits of teachers’ language learning experience comes from two empirical studies. A survey of 143 secondary mainstream teachers in a Great Plains community with a population of approximately 80,000 found that teachers who had completed one or more years of foreign language classes in high school or college were “significantly more positive about teaching ESL students than were teachers who had not taken foreign language classes” (Youngs & Youngs, 2001, p. 110). Qualitative case studies of eight preservice teachers studying a language unfamiliar to them indicated that they had developed a better understanding of language as a system, were more aware of the difficulties ELLs might face, and were able to identify more and less successful approaches to teaching language (Hyatt & Beigy, 1999).

Having contact with speakers of languages other than English

The second type of experience that has been shown to influence teacher attitudes toward ELLs is contact with people who speak languages other than English. Youngs and Youngs (2001) found that classroom teachers who had lived or taught outside the U.S. had significantly more positive attitudes toward ELLs than those lacking such experiences. Simply traveling abroad and hosting a foreign student were not significantly related to teachers’ attitudes. This latter finding points to the importance of extended contact. Another study showed that experience with ELLs in U.S. schools can also have a positive impact on teachers’ attitudes. Byrnes et al. (1997) administered the Language Attitudes of Teachers Scale (LATS) to 191 regular classroom teachers in Arizona, Utah, and Virginia (see also Byrnes & Kiger, 1994; Byrnes et al., 1996). They found that teachers who had had more experience with ELLs had more positive attitudes toward them. While this study suggests that contact with ELLs can have a positive impact on teachers’ attitudes, teacher educators have argued that contact alone does not guarantee this impact (Evans et al., 2005; Zeichner & Melnick, 1996). A qualitative study of community service learning in a teacher education course found that, without skillful guided reflection on their experiences, some prospective teachers interpreted their experiences in ways that perpetuated stereotypes (Lucas, 2005b).

Language-related attitudes and beliefs teachers need for teaching ELLs

As presented in Figure 34.1, the second language-related quality teachers need for teaching ELLs encompasses relevant attitudes and beliefs. Distinctions between attitudes and beliefs are often imprecise, largely because there are overlaps in the conceptual territory covered by these concepts. Given this lack of clarity in the literature, we will treat these two concepts together here. Attitudes and beliefs have been examined at length and consistently found to be influential in teachers’ interactions with their students (Richardson, 1996). Three specific attitudes/beliefs associated with teaching ELLs are discussed below—affirming views of linguistic diversity and bilingualism, awareness of the sociopolitical dimension of language use and language education, and inclination to collaborate with colleagues who are language specialists.

Affirming views of linguistic diversity and bilingualism

The literature on multicultural education and culturally responsive teaching is unanimous in its emphasis on the critical role played by the extent to which teachers have affirming, positive attitudes toward their students and their students’ home cultures
(Villegas & Lucas, 2002). Because of the strong connection between language and identity (Delpit, 1998; Nieto, 2002; Rickford & Rickford, 2000), teachers’ attitudes toward their students’ languages and language proficiencies send powerful messages about their attitudes toward the students and their families. Teachers who view linguistic diversity and bilingualism as resources rather than deficiencies are also more likely to recognize that limited proficiency in English is not equated with limited ability to learn (González & Darling-Hammond, 1997; Lucas et al., 1990; Maxwell-Jolly & Gándara, 2002). Empirical evidence suggests that teachers’ attitudes and beliefs about their students’ language uses and language learning have an impact on their expectations of ELLs, the nature of their interactions with ELLs, and their instructional practices (Byrnes et al., 1997; Byrnes, et al., 1996; Platt & Troudi, 1997; Walker et al., 2004; Youngs & Youngs, 2001).

Awareness of the sociopolitical dimension of language use and language education

Although people tend to see language as a politically neutral set of skills, language is intimately tied to its social and political context. Therefore, the second fundamental attitude for classroom teachers of ELLs is awareness of the sociopolitical dimension of language. Such awareness is a prerequisite for understanding linguistic diversity and avoiding erroneous assumptions about students’ language abilities and uses. Villegas and Lucas (2002) have argued that culturally responsive teachers have developed sociocultural consciousness—that is, awareness that each person’s worldview is influenced by such factors as class, race, and gender; that people of different sociocultural backgrounds are likely to have different and equally valid worldviews; and that power is differentially distributed in society so that the worldviews of people from some groups are valued more highly than those of others. Equally important for teachers of ELLs is sociolinguistic consciousness—the understanding that language variation, both within and across languages, is a natural social phenomenon; that no language or language variety is inherently better than another; and that the dominant position of a language or language variety within a particular social context derives from the power of the speakers of that language rather than from any linguistic factors (De Jesus, 2005; Delpit, 1995; Fasold, 1990; Grinberg & Saavedra, 2000). Teachers with sociolinguistic consciousness understand their students’ experiences as speakers of subordinated languages and recognize that the challenges they face go beyond the cognitive difficulties of learning a second language (see Olsen, 1997). Such teachers are vigilant in reflecting on their own assumptions about ELLs, and cognizant of the fact that their perceptions of language, language use, and language learning are shaped by their own and their students’ sociocultural positioning.

Bartolomé (2000, 2002) has argued that ideological clarity is fundamental to teachers’ ability to fully grasp the political nature of language and to foster academic success for language minority students. Ideological clarity is “the process by which individuals achieve a deepening awareness of the sociopolitical and economic realities that shape their lives and their capacity to transform them” (p. 167). Similarly, Villegas and Lucas (2002) argue that, to develop affirming rather than deficit views of children from diverse backgrounds, teachers must recognize that there are structured inequalities at all levels in society that ultimately result in lower academic achievement of students from subordinated groups—including language minorities (see also Grinberg & Saavedra, 2000 for a discussion of this phenomenon with regard to immigrants).
Inclination to collaborate with colleagues who are language specialists

Another important attitude for classroom teachers of ELLs—especially for those who have not developed expertise for teaching ELLs—is the willingness to collaborate with colleagues who are language specialists (Lucas, 1997; Maxwell-Jolly & Gándara, 2002; Milk et al., 1992). By sharing their knowledge and expertise, teachers not only learn from each other but also create a sense of collective responsibility for educating ELLs. It is especially helpful for classroom teachers to communicate and collaborate with ESL and bilingual educators. The classroom teachers benefit from the expertise of the specialists, and the specialists benefit from learning more about the expectations and priorities of the regular classroom. Even if there are no ELL specialists in a school, teachers can collaborate to build individual and collective knowledge and skills. They can also reach out to aides and community members with relevant linguistic, cultural, and professional knowledge and experience. To make use of these resources, teachers must be open to working closely with others.

Language-related knowledge teachers need for teaching ELLs

Common misconceptions about language learning and teaching can lead to the mis-education of ELLs. Responsible preparation of classroom teachers to teach ELLs includes facilitating the development of knowledge to dispel those misconceptions. Knowledge in four broad areas is of particular help to teachers: (a) the language backgrounds, experiences, and proficiencies of their students; (b) second language development; (c) the connection between language, culture, and identity; and (d) language forms, mechanics, and uses. These are discussed below.

The language backgrounds, experiences, and proficiencies of their ELL students

The first type of language-related knowledge that is essential for classroom teachers of ELLs is knowledge of their students’ linguistic backgrounds, experiences, and proficiencies. This knowledge is important for two reasons. One reason is that relationships are central to healthy human development and to students’ academic engagement (Comer, 1993; Cummins, 2000; Palinscar, 1996). To develop relationships with students, teachers need to know what language students are most fluent and comfortable in, what language(s) they use at home, and how they feel about the uses of their native language and English. The second reason is that, to facilitate students’ learning, teachers need to be able to help them build on their prior linguistic knowledge, experiences, abilities, and resources. Students’ linguistic resources can be used to support their learning (Moll & González, 2004). Therefore, teachers need to know about a student’s oral and written proficiency in the native language as well as in English, what language is spoken at home, how language is used and by whom in the student’s community, and how strongly the student’s family and community feels about maintaining the native language (Lucas, 1997; Villegas & Lucas, 2002).

Second language development

To make sense of ELLs’ oral and written performance and to facilitate their instructional decision making, teachers also need knowledge of second language development. Teachers of ELLs need to be able to draw on established principles of second language
acquisition (SLA) (Carlson & Walton, 1994; Gándara et al., 2005; González & Darling-Hammond, 1997). While the field of SLA research has examined many facets of the second-language-learning process, we have distilled seven principles of SLA that are commonly highlighted in the literature as having especially important implications for teaching. It is beyond the scope of this chapter to elaborate on these principles; we can only provide brief explanations of each below.

First, mainstream teachers need to know that learners with strong native language and literacy skills learn second languages more easily and more fully than those with weak native language skills (Thomas & Collier, 2002; Cummins, 1981, 2000). Teachers, therefore, should learn about and draw on the native language abilities of ELLs in their classes and support further development of those abilities. The second principle of second language learning is that cognitive and linguistic benefits derive from additive bilingualism (that is, the addition of a second language to a first language) while deficits derive from subtractive bilingualism (that is, the replacement of the first language by the second language) (Cummins, 1976, 2000). As such, teachers should encourage ELLs to continue to develop their native languages and should recognize their native language as a resource for learning.

Third, teachers need to know that for students to learn a second language, they must have direct and frequent contact with people who are fluent in the language (Wong-Fillmore & Snow, 2005). This principle reflects Vygotsky’s influential theory that individual learning originates in social interaction (1978). It suggests that teachers should design instruction so that ELLs can actively engage in meaningful interactions with their English-speaking peers. Designing such instruction requires special skills, which we discuss below.

Fourth, teachers need to understand that conversational language proficiency is fundamentally different from academic language proficiency. This is largely because the cognitively demanding and decontextualized discourse involved in learning academic concepts poses greater challenges than the cognitively undemanding and contextualized discourse involved in conversations (Cummins, 1979, 1981, 2000). As this principle suggests, teachers cannot assume that children who are conversationally fluent have developed sufficient academic language proficiency to be successful in school. They need to consider all the modes of language—listening, speaking, reading, and writing—in their approaches to teaching ELLs.

The fifth principle of second language learning is that, for SLA to occur, the language that a learner encounters must be comprehensible to him or her (Krashen, 1982, 2003). It does no good for a learner to listen to hours of lectures in the second language if she cannot understand what is being said. Therefore, teachers need to give conscious thought to how they can modify the spoken and written language for ELLs in their classes. A related principle is that the best linguistic input for language learners needs to be just slightly beyond the learners’ current level of proficiency (Krashen, 1982, 2003). Language that is too easy does not result in new learning, and language that is too difficult is not comprehensible. Together, the fifth and sixth principles of SLA suggest that teachers must think carefully about how they use language and how they scaffold language for ELLs.

The final principle of second language learning we want to highlight is that anxiety in the language learning situation can be an obstacle to language learning. Not only can anxiety distract learners from the linguistic “input” they encounter (Krashen, 1982, 2003), it can also lead them to withdraw from social interaction, which is critical to language learning (Pappamihiel, 2002). The implication for teachers is that they need to avoid placing ELLs in embarrassing or stressful situations and to prevent ridicule of ELLs by their English-speaking peers.
The connection between language, culture, and identity

The third essential type of knowledge for classroom teachers of ELLs is an understanding of the powerful link between a person’s language and his/her sense of affiliation, or belonging, to social and cultural groups (Rickford & Rickford, 2000; Romaine, 1994). If teachers understand the connection between language, culture, and identity, they will be more likely to develop respectful, affirming attitudes toward linguistic diversity, which we discussed above. Teachers’ understanding of the relationship between language and culture can also prevent miscommunication resulting from cultural differences that are expressed through language (Wolfram et al., 1999). An influential body of research in the 1970s and 1980s identified cross-cultural differences in communication and interaction patterns that can interfere with student learning (e.g. Au, 1980; Heath, 1983; Michaels, 1981; Philips, 1972, 1983). If teachers understand that the way students express themselves reflects different cultural values and expectations, they can learn not to make assumptions about students’ intentions based solely on their own cultural framework (Price & Osborne, 2000; Valdés, 2001).

Language forms, mechanics, and uses

Finally, classroom teachers of ELLs need knowledge of language forms, mechanics, and uses. González and Darling-Hammond (1997) have argued that “language is the most visible aspect of student diversity that schools encounter and that the school staff are least prepared to address in a manner that demonstrates reciprocal respect” (p. 12). In the past, everyone in U.S. schools studied the structure of English. In recent decades, however, the teaching of grammar has come to be seen as a quaint practice of earlier generations, and no other study of language as language has replaced it in undergraduate education (Wong-Fillmore & Snow, 2005). Study of a foreign language could give teachers a sense of language structure, but many teacher education programs do not require candidates to study a foreign language. To facilitate students’ language development, teachers must understand the forms, mechanics, and uses of language in general and of the particular language(s) in which they are teaching (Gándara et al., 2005; Valdés et al., 2005; Wong-Fillmore & Snow, 2005). A number of educational linguists have specified the linguistic knowledge needed by teachers (e.g. Freeman & Freeman, 2004; Justice, 2004; Valdés et al., 2005; Wong-Fillmore and Snow, 2005).

Language-related skills teachers need for teaching ELLs

The fourth and final set of language-related qualities for teaching ELLs presented in Figure 34.1 entails skills for conducting basic linguistic analyses of oral and written texts, skills for engaging in cross-cultural and cross-linguistic communication, and skills for designing instruction that helps ELLs learn both language and content.

Skills for conducting basic linguistic analysis of oral and written text

The challenge of learning through academic language in English while still in the process of learning English as a language of communication is daunting and greatly underestimated by most monolingual people. To promote language development in the context of learning academic content and skills, teachers of ELLs need to be able to analyze the linguistic demands of oral and written discourse and design instruction accordingly (Cummins, 2000; Wong-Fillmore & Snow, 2005). For teachers of particular disciplines,
this means being able to identify the vocabulary, syntax, and discourse patterns of their discipline that are likely to be especially challenging for ELLs (Valdés et al., 2005). For English/Language Arts teachers, it also means being able to provide explicit instruction in language structures and uses (Wong-Fillmore & Snow, 2005) and to explain grammatical errors in ways that can help ELLs edit their writing (Walker et al., 2005).

Skills for participating in cross-cultural and cross-linguistic communication
As we discussed above, culture influences the ways people express themselves and interact with others. While an understanding of this connection between language and culture is essential for teachers of ELLs, an understanding alone is not sufficient; teachers must be able to use this understanding to communicate with students and their families who are from diverse cultural and linguistic backgrounds. They need strategies for learning about the students’ culturally-based communication patterns and for responding in ways that facilitate communication across cultural and linguistic differences (Gándara et al., 2005). Wolfram et al. (1999) recommend that teachers conduct research on the ways language is used in interactions in their classes. They also recommend that teachers thoughtfully examine whether they might be misunderstanding speech acts (e.g. explaining, reporting, requesting, denying) and participation structures by students of different cultural backgrounds in their classes. Teachers also must be able to communicate successfully with the families of their students (Goldfarb, 1998; Nieto, 2000). Engaging them in school-related activities requires reaching out to them in ways that are culturally congruent and linguistically accessible for them. One way to reach out to parents and to ELLs is to develop some ability to communicate in their native language—even if only minimally. This ability can facilitate communication as well as build trust and rapport (Stanton-Salazar, 2001). Pre-service teachers at Boston College found “even minimal proficiency in Spanish invaluable” in providing a meaningful connection to the Spanish speaking children with whom they were working (Friedman, 2002, p. 214).

Skills for designing instruction to help ELLs learn both language and content
The final language-related skill for teaching ELLs is that of designing instruction to facilitate the learning of both English and content. There is a growing body of work focused on the academic instruction of ELLs in content classes (e.g. Echevarria & Graves, 2003; Echevarria et al., 2004; Gibbons, 2002). While most of this work involves bilingual and ESL teachers, the pedagogical strategies considered effective for these specialized instructors are applicable for use by regular classroom teachers. Drawing on this literature, we highlight nine instructional strategies that regular classroom teachers could use to facilitate ELLs’ learning of both language and content. These highlights are presented in Figure 34.2. Preparing classroom teachers to use these strategies would considerably improve the experiences of ELLs in their classrooms.

Summary
We noted at the beginning of this section that we were going to highlight only the experiences, attitudes and beliefs, knowledge, and skills that are particularly relevant to language issues. Still, teachers with no previous cross-linguistic or cross-cultural experience and no experience teaching ELLs could easily be overwhelmed by the scope of the
expectations for teachers of ELLs we have presented. We acknowledge that advocates for preparing classroom teachers to teach ELLs need to be “honest with ourselves about the enormous complexity of what we are asking teachers to do” and to know and to believe (Palinscar, 1996, p. 223). The responsibility, however, lies not only with teachers but also with pre-service and in-service teacher educators. We need to find ways to begin to help future and current teachers develop these experiences, dispositions, knowledge, and skills. The following section of the chapter describes what the literature tells us about efforts already underway.

EFFORTS TO PREPARE CLASSROOM TEACHERS TO TEACH ENGLISH LANGUAGE LEARNERS

Teacher educators, especially in geographic areas with substantial language minority populations, are beginning to recognize the necessity of preparing classroom teachers to teach the ELLs they are likely to have in their classes. There is increasing evidence in the literature of efforts to provide the types of experiences and cultivate the dispositions, knowledge, and skills described above. To learn about those efforts, we turn to a body of literature which includes some small-scale qualitative and evaluation studies (Delaney-Barmann & Minner, 1995; Evans et al., 2005; Hadaway, 1993; Levy et al., 2002; Lucas, 2005a; Zetlin et al., 1998), but which is largely descriptive. No doubt there are many innovative efforts to prepare classroom teachers to teach ELLs that are not represented in the literature. We hope that those involved in such efforts will write about them and will
conduct research to examine their functions and impact. We also recognize that changes may have occurred in the programs included here. However, the lack of currency of some examples does not make them any less useful for envisioning possibilities.

From our examination of the literature, we identified seven strategies used to prepare classroom teachers to teach ELLs in pre-service and in-service contexts, which we present in this section. These are listed in Figure 34.3, which provides an outline of this section of the chapter. The four structural strategies require some redesign and reorganization of the curriculum in teacher education programs in institutions of higher education (IHEs). While structures need to be put in place to support the three process strategies, they can be implemented without restructuring the curriculum and they can take place in schools as well as IHEs. Therefore, they are better characterized as processes for teacher preparation than as strategies for modifying program structure. We describe these seven strategies below. For purposes of brevity, we present only one or two examples to illustrate each. The examples show multiple approaches to cultivating the experiences, knowledge, skills, and dispositions discussed above.

**Structural strategies to prepare teachers to teach ELLs**

**Add a course**

To address issues or populations that have not previously been included in mainstream pre-service teacher education programs (e.g., teaching students of diverse racial and ethnic backgrounds and students with disabilities), teacher educators have generally added a course on the topic or tried to infuse attention to the issue throughout the curriculum (Villegas & Lucas, 2002). The first structural strategy to prepare teachers to teach ELLs is to add a course to the curriculum. The obvious benefit of this strategy—assuming the course is required of all teacher candidates—is that it signals the importance of preparing all teachers to teach ELLs and ensures that future teachers give their full attention to becoming prepared to teach ELLs. On the other hand, adding a course poses a challenge for most teacher education programs because of the limited number of teacher education credits allowed in many states. Still, some institutions have taken this approach.

At the University of Minnesota, as a result of pre-service teachers’ expressed need for better preparation to teach ELLs, a one-credit course was added to the pre-service curriculum (Walker et al., 2005). Guided by the “fundamental premise” that “the best teaching [of ELLs] . . . requires an effective integration of language and content” (p. 318), faculty teach special sections of the course for elementary teacher candidates and for candidates in different content area programs. Though only for one-credit, this course appears to provide a comprehensive overview of relevant issues. Every section of the course

*Figure 34.3 Strategies to prepare classroom teachers to teach ELLs.*
addresses some common issues and engages in some common activities, including in-school experiences working with ELLs, principles of second language learning, demographic information about ELLs in the U.S. and in the local area, cultural information about immigrant groups in the local area, and curricular and instructional practices for successfully teaching ELLs. In addition, the section of the course for candidates in the elementary program emphasizes different models of ESL services and “the importance of collaboration between the classroom teacher and the ESL teacher” (p. 320). Candidates in the disciplinary sections of the course analyze the vocabulary and syntax of textbooks to determine challenges ELLs might face in using them, and the English/Language Arts section introduces ways teachers can explain grammatical errors to their future students. Courses added at two other institutions concentrate on linguistic knowledge and skills: an introductory linguistics course for teachers taught by Valdés at University of California, Berkeley (Valdés et al., 2005), and a Spanish for Teachers course at Northern Arizona University (NAU) (Delaney-Barmann & Minner, 1995).

Modify existing courses and field experiences to infuse attention to teaching ELLs across the curriculum

A second major approach to addressing new issues within an existing pre-service teacher education curriculum is to infuse the issues throughout the curriculum by modifying existing courses and field experiences. In this vein, Valdés et al. (2005) argue that “a language strand [should] become an integral part of the required program for all teachers” (p. 161). Infusing attention to language and to teaching ELLs across the curriculum is theoretically preferable to adding a course because it makes these concerns integral to all aspects of teaching and of becoming a teacher. However, in practice, infusion often does not live up to its potential. It requires that teacher education faculty have the knowledge, skills, and commitment to address the issues in a less-than-superficial way (Villegas & Lucas, 2002). (We discuss the need for professional development for faculty at the end of this section.)

A number of teacher education programs have taken the infusion approach to improving the preparation of classroom teachers to teach ELLs. For some, the goal was infusion of relevant cultural and linguistic issues across all courses (Bermúdez et al., 1989; González & Darling-Hammond, 1997 [UC Santa Barbara]; Merino, 1999). One infusion strategy at NAU is to address issues relevant to ELLs in “special enrichment activities” such as seminars, guest lectures, and special field trips (Delaney-Barmann & Minner, 1995, p. 7).

Other institutions targeted one particular course for modification rather than the entire curriculum (e.g. methods courses at San Diego State University (SDSU) [González & Darling-Hammond, 1997]). Hadaway (1993) describes the details of one effort to infuse attention to ELL issues in a required multicultural education course at a state university in a culturally and linguistically homogeneous area. The course had not previously addressed linguistic diversity in depth and included no field experience. To give the largely monolingual pre-service teachers the opportunity to interact with ELLs, faculty instituted a pen-pal program through which each teacher candidate in the course was paired with an ELL in one of eight schools in four districts. The written interactions with the children provided the first exposure to children of different cultural and linguistic backgrounds for many of these teacher candidates. They had practice communicating across cultural and linguistic boundaries for the first time. In class, the teacher candidates engaged in discussions of their experiences and confronted some negative attitudes and stereotypes, guided by the course instructor. Through pre- and post-semester surveys,
Hadaway determined that the teacher candidates learned about the “culture, language, family traditions, and customs” of the ELLs (p. 28) and developed more positive attitudes about having ELLs in their future classes. One teacher candidate wrote that she had come to better understand “how it feels to be a non-native speaker in the United States” (p. 28).

Add or modify pre-program requirements

Another structural strategy described in the literature for preparing teachers to teach ELLs is to add or modify requirements for candidates prior to formal entry into a preservice teacher education program. In practice, this strategy is equivalent to a modification of criteria for admission to teacher education. While we found only minimal evidence that institutions are using this strategy, we include it because of its potential to improve the preparation of teachers of ELLs. One advantage of this strategy is that, because prerequisite courses are not part of the professional education sequence, they can be added without reducing the number of education credits already required. This strategy can also ensure that future teachers have developed particular knowledge and skills before they begin their formal preparation program. The strategy is problematic, however, for students who transfer from community colleges to four-year institutions and in institutions where there are already many lower-division requirements.

Study of a second language is one logical prerequisite for admission to teacher education, given the association between having studied a foreign language and positive attitudes toward ELLs (Hyatt & Biegy, 1999; Youngs & Youngs, 2001) and the commonly recognized benefits of language study for all citizens. Because pre-service teachers at Boston College “found even minimal proficiency in Spanish invaluable as they developed and implemented instruction for mainstream classrooms,” Friedman (2002) reported that Boston College was considering adding a second/foreign language requirement for admission to teacher education (p. 214). Knowledge of a second language is already a prerequisite for admission to the minor in Teaching English Language Learners (TELL) that is available to candidates in Early Childhood, Elementary, and Secondary Education certificate programs at Boston College. Courses in linguistics are also potential prerequisites for teacher candidates (Wong-Fillmore & Snow, 2005), such as the introductory linguistics course taught at UC Berkeley by Valdés (Valdés et al., 2005).

Add a minor or supplemental certificate program

The fourth structural strategy to prepare teachers to teach ELLs is to offer a minor or supplemental certificate program related to teaching ELLs that pre-service teachers can pursue along with their major field of study. Because it generally involves a coherent sequence of several courses, this strategy provides the most comprehensive pre-service preparation for classroom teachers of ELLs of all the strategies we identified. For the same reason, it is the most difficult to require; institutions are reluctant to add to the time students must spend taking courses—especially given the already lengthy undergraduate careers of many students.

As mentioned above, Boston College has developed a minor in Teaching English Language Learners (TELL) for candidates in Early Childhood, Elementary, and Secondary Education (Friedman, 2002). Intended to provide “a systematic and extended study of theory and pedagogy . . . for students interested in teaching in urban and changing suburban environments” (p. 213), the minor requires four courses—Linguistic Structure of English, Classroom Assessment, Teaching Bilingual Students, and Second Language
Acquisition. Candidates also complete a field experience in a mainstream classroom with a teacher with ESL preparation. (See details on the Boston College Lynch School of Education website: www.bc.edu.) Other minors/supplemental certificates are offered at Temple University (Nevárez-La Torre et al., 2005) and at NAU, where it is called a “special content emphasis” (Delaney-Barmann & Minner, 1995).

California’s Cross-Cultural, Language, and Academic Development (CLAD) certificate, instituted in 1992 in California to provide teachers with basic knowledge and skills for teaching ELLs, was not technically a minor; it was the enactment of a state policy rather than a program of study at one university. However, it had a similar function and structure in that its certified teachers had developed particular knowledge, skills, and dispositions for teaching ELLs in addition to the knowledge, skills, and dispositions required for teaching particular grades and academic subjects (see August & Hakuta, 1997; Carlson & Walton, 1994; Kuhlman & Vidal, 1993; Merino, 1999). To be awarded the CLAD certificate, teachers had to have a valid California teaching credential, satisfy a second-language requirement, and show that they had developed knowledge of three domains—(a) language structure and first- and second-language development; (b) methodology of bilingual instruction, instruction for English language development, and specially designed academic instruction delivered in English; and (c) culture and cultural diversity (California Commission on Teacher Credentialing, 2004). Teachers could earn a CLAD certificate by taking 12 upper-division credits in the three domains above, or they could take an examination. The CLAD certificate has been supplanted by a requirement that all teacher education programs infuse methods for teaching ELLs across the curriculum—an approach that has diluted the preparation of classroom teachers for teaching ELLs (J. Maxwell-Jolly, personal communication, 8/22/05). We include this brief description of the CLAD certificate program because it represented a large-scale and intensive effort to ensure that all classroom teachers were fully prepared to teach ELLs. As such, it can serve as a model for other institutions (see González & Darling-Hammond, 1997; Kuhlman & Vidal, 1993; Merino, 1999).

**Process strategies to prepare teachers to teach ELLs**

The four previous strategies for preparing teachers to teach ELLs require structural changes in the teacher education curriculum. We now turn to three process strategies that can be implemented without restructuring the curriculum and that can take place in schools as well as institutions of higher education. While these approaches are not dependent upon curriculum change, they do require educators in universities and in schools to function in new and often unfamiliar ways. The first two of these strategies—mentoring and collaboration across institutions—can be successful only if the participants develop new kinds of working relationships. The third strategy—providing professional development for teacher educators—requires “experts” to acknowledge and act on their need to develop new knowledge and skills.

**Offer mentoring for practicing teachers**

The first process strategy we identified is mentoring for teachers already in the classroom. Formal and informal mentoring can be effective in facilitating the development of practicing teachers’ knowledge and skills for teaching ELLs. The Language Minority Teacher Induction Project (LMTIP) at George Mason University, which received funding from 1998 to 2004, brought together teams of four to six beginning teachers, a mentor, and a university professor for the purpose of providing support to beginning teachers in schools.
with large numbers of ELLs (Levy et al., 2002). The teams met regularly and designed and carried out action research projects with the support of their mentors, which served as “the driving force behind the growth and improvement of ELL education” at the schools involved (p. 273). Levy and colleagues drew conclusions about the impact of the initiative from examining the action research projects conducted by 66 teachers, all of which included some form of assessment of student growth. The researchers concluded that teachers engaged in ongoing reflection on their practice, enhanced their understanding of and skills for modifying instruction for ELLs and for communicating with students across different cultures, learned about their students’ cultural backgrounds and prior knowledge, and developed more positive perceptions of their students. Mentoring is also a central feature of the Bilingual/ESL Teacher Leadership Academy (BETLA), an initiative at Bank Street College to develop leadership skills in exemplary bilingual and ESL teachers in the New York City Public Schools so they can become leaders in their schools and mentors for their colleagues regarding the education of ELLs (Hernandez, 2005; Lucas, 2005a). Retired bilingual and ESL teachers provide extensive mentoring for the teachers for a year.

**Foster collaboration across institutional boundaries**

The most frequently discussed process strategy for preparing both prospective and current teachers to teach ELLs is collaboration across institutional boundaries. The argument for collaboration between classroom teachers of ELLs and their colleagues (especially specialists in ELL education) is compelling, given the increasing number of ELLs in classes with teachers who are not prepared to teach them, as we previously discussed. Through collaboration, both pre-service and practicing teachers can gain experience and develop dispositions, knowledge, and skills for teaching ELLs. Bermúdez et al. (1989), Evans et al. (2005), Gebhard et al. (2002), Kaufman and Brooks (1996), and Levy et al. (2002) describe initiatives in which faculty in different pre-service programs and university departments have collaborated to teach courses taken by candidates in different programs. Here, we elaborate on one of these efforts.

At the University of Arizona, three faculty members (a bilingual social studies instructor, a math and science instructor, and an English language arts instructor) taught their respective courses to a group of pre-service teachers, ten of whom were in the bilingual education program and 18 of whom were in the mainstream teacher education program (Evans et al., 2005). After the semester, Evans and her co-authors examined course syllabi, fieldnotes by the bilingual instructor, fieldnotes by another of the authors who was not an instructor, and two sets of written reflections by the students. The participants reported that the most “cherished” aspects of the experience were “the opportunities to ‘live multiculturalism’ and to form a sense of collegiality in a consciously multicultural-bilingual community” (p. 81). Instructors stressed collegiality and respect, and tried to allay fears of potential cross-cultural conflict. In the social studies class, students had multiple opportunities to reflect on and discuss “issues of race, prejudice, cultural difference, and equity,” with the goal of strengthening intercultural sensitivity, promoting cross-cultural communication, and helping students to “learn from one another in a safe and respectful multicultural setting” (p. 81). Because instruction was conducted in both English and Spanish, students interacted at times “in their weaker language” (p. 83). The native English speakers recognized the inequity in the fact that the great majority of instruction in the courses was in English and they advocated for more use of Spanish. This experience helped sensitize them to “the treatment of bilingualism as a problem” (p. 84) and led them to see the need to advocate for greater recognition and value for bilingualism.
Evans and her colleagues concluded that the bilingual, bicultural learning community that developed was beneficial for the future mainstream teachers, who developed greater cross-cultural understanding and greater sensitivity to the challenges of ELLs and to the subordinate position of non-English languages in the U.S. However, they do not recommend the replication of their collaborative initiative without some modifications, largely because the bilingual education candidates were not as well prepared as they would have been as a result of reduced modeling of bilingual instruction and less opportunity to use Spanish in the classroom. The authors do argue that combining bilingual and mainstream teacher candidates in some courses and for some purposes can be beneficial in helping future teachers develop skills and confidence for building cross-cultural collegial relationships.

Professional development initiatives for practicing teachers also highlight the importance of collaboration (Alfred, 1994; González & Darling-Hammond, 1997 [International High School, in NYC]; Sakash & Rodriguez-Brown, 1995; Walqui, 2000; Zetlin et al., 1998). Because of the fragmented and specialized nature of teaching and schooling, teachers in different departments or programs rarely have extended interactions about students, though each group (e.g. classroom teachers, ESL specialists, bilingual specialists) has expertise that could benefit the other (Kaufman & Brooks, 1996; Lucas, 1997). While many of these collaborative professional development efforts are instructive, we can highlight only one here—the description of professional development over four years at Harden Middle School (HMS) in Salinas, CA (Walqui, 2000).

Opened in 1992, HMS was a year-round school organized according to “houses,” with 68 percent of the students designated as limited English proficient. The focus of professional development for faculty at the school evolved over the four years described by Walqui, but collaboration continued to be a central element of it. During the first year, faculty decided that professional development would focus on developing collaborative working relationships among the interdisciplinary teams within the houses. During the second year, they decided to concentrate on preparing all teachers at the school to earn the California Language Development Specialist (LDS) certificate. Groups of faculty members participated in sessions on cultural, linguistic, and educational theories fundamental to the education of ELLs; the native languages and cultures of the ELLs in the school; and research on promising instructional practices for ELLs. For the third year, faculty decided to focus on teaching challenging academic content in English to ELLs. To support their learning, faculty engaged in team planning and team teaching activities, wrote and shared reflective journals, and carried out peer observations. They were supported by two resource teachers hired with federal funds to spend half their time at the school and serve as mentors for the teachers. In-service sessions offered opportunities for teachers to examine and discuss issues of social justice as they relate to ELLs. In the fourth year, professional development focused on the development of interdisciplinary thematic units by teams of teachers. Walqui’s description captures the complex, evolving, and collaborative nature of professional development at the school, as the faculty grappled with trying to develop the knowledge, skills, and dispositions they needed to teach ELLs successfully.

**Provide professional development for teacher education faculty**

The final process strategy for preparing classroom teachers to teach ELLs is to provide professional development for teacher education faculty. Even if all the structural changes previously described were instituted in a teacher education program, they would have little impact if the faculty teaching the courses did not have the knowledge and skills to
prepare teachers to teach ELLs. Since teacher educators generally do not have such knowledge and skills, professional development for them must be an integral part of any effort to modify teacher education to prepare classroom teachers to teach ELLs (Steffens, 1992). A number of professional development efforts have been undertaken in recognition of this imperative (Costa et al., 2005; González & Darling-Hammond, 1997 [San Diego State University]; Nevárez-La Torre et al., 2005). We describe only one of these.

Faculty at Boston College developed a three-year federally-funded professional development initiative, one part of which addressed the preparation of faculty to prepare their students to work with linguistically and culturally diverse students (Costa et al., 2005). During the spring semester, faculty volunteers participated in a seven-session seminar. They read and discussed literature on the education of ELLs, and were expected to explore ways to modify their syllabi to incorporate more attention to ELLs and then to implement the changes. Topics addressed in the seminar included “current and historical controversies in bilingual education” (p. 108), local language policy and programs, social and cognitive factors of bilingualism, attitudes toward bilingualism, strategies for differentiating instruction, culture and identity development, and the nature and process of second language development. Participants analyzed the language of textbooks and state assessments to determine difficulties they might pose for ELLs. They visited a school and observed classes with ELLs, reflecting on what they had seen and the implications for classroom teachers of ELLs. During the summer following the seminar, participants presented their plans for modifying their courses to their colleagues, and in the fall they began implementing the changes to incorporate more attention to language and linguistic diversity.

Summary

Some strategies teacher educators are using to prepare classroom teachers to teach ELLs require structural modifications in teacher education programs at institutions of higher education (adding a course, modifying existing courses to infuse ELL issues, modifying pre-program requirements, and adding a minor or certificate). Others are more accurately characterized as processes than as structures (offering mentoring for practicing teachers, fostering collaboration across institutional boundaries, and providing professional development for faculty). The first two of these processes apply largely to practicing teachers, but they involve participants from different institutional contexts. Several of the above descriptions emphasize the evolutionary nature of these initiatives, and many of them are, no doubt, still evolving (e.g. González & Darling-Hammond, 1997; Walqui, 2000; Zetlin et al., 1998). This is a reminder that quick-fixes—whether for pre-service teacher education programs or in-service professional development—are not realistic. Learning to be a successful teacher of ELLs takes time, and so does developing strategies for supporting such learning.

Many complex contextual factors determine which of these strategies, or others, will be most workable for a particular teacher education program, school, or school district. For that reason, the variety of strategies teacher educators are using to improve the preparation of classroom teachers to teach ELLs is heartening. At IHEs, the most comprehensive approach that also ensures direct focus on issues related to ELLs is to add a minor or supplemental certificate. But adding a course or requiring foreign language credits before program entry can also contribute to the preparation of teachers to teach ELLs. Infusion across the curriculum is theoretically comprehensive and, in its ideal form, the most desirable strategy, but in practice too few faculty members are sufficiently knowledgeable of the issues to fully infuse them into the curriculum. For preparing
practicing teachers who are not enrolled in formal teacher education programs, efforts that emphasize collaboration seem to offer the most comprehensive approach to develop knowledge and expertise in teaching ELLs.

Clearly, other efforts can and are being undertaken in pre-service and inservice teacher education to better prepare classroom teachers to teach ELLs. Teachers, prospective teachers, teacher educators, and, most importantly, ELL students will benefit from greater dissemination of current efforts. However, while data were reported for several of the initiatives described above, we need far more rigorous, systematic studies. Such research is desperately needed for teacher education in general and for the preparation of teachers of ELLs even more so. In the final section of the chapter, we make recommendations for such research as well as for policy.

CONCLUSION AND RECOMMENDATIONS

This chapter has examined the literature on the preparation of non-specialist classroom teachers to teach English language learners. We have argued that more attention should be given to such preparation because of the increasing likelihood that ELLs will be in mainstream classes, because of the special challenges faced by classroom teachers of ELLs, and because classroom teachers are not now adequately prepared to meet those challenges. We then identified language-related experiences, attitudes and beliefs, knowledge, and skills needed by classroom teachers of ELLs. While some of these characteristics are alluded to in the literature on preparing culturally responsive teachers, they tend to be treated superficially, if at all. We argue that teacher educators need to give more attention to cultivating these characteristics in all teachers. Finally, drawing on both descriptive and empirical literature, we identified four structural strategies and three process strategies for preparing teachers to teach ELLs in pre-service and in-service contexts. In the following pages, we will highlight a few themes that emerged from our examination of the literature and then make recommendations for policy and research.

One theme that runs through the chapter is the importance of teachers having a variety of language experiences (Byrnes et al., 1996, 1997; Griego-Jones, 2002; Youngs & Youngs, 2001). These include exposure to languages other than English, contact with people who speak other languages, and spending an extended period of time in a context where English is not the dominant language. The importance of these experiences is distinct from knowledge about language structures and uses. Teachers of ELLs gain something more than knowledge when they observe people interacting in different languages for different purposes and in different contexts, speak a language that is not the dominant language, and go through the process of trying to learn a second language—with all the accompanying challenges, anxiety, and exhilaration. While the knowledge and skills gained from such exposure is important, it is the complete experience of these phenomena that gives teachers a deep understanding—physical, emotional, and social as well as cognitive—that they can bring to interactions with English language learners.

The second theme emerging from our review of the literature is the critical importance of linguistic knowledge for teachers. We have used two metaphors—pulling language threads from the larger cloth of the preparation of culturally and linguistically responsive teachers, and challenging the invisibility of language issues in teacher preparation. These are akin to Nieto’s (2000) call to bring bilingual education out of the basement. All three are, we believe, apt metaphors, given the marginality of language issues, linguistic diversity, and the education of English language learners in the literature on teacher education. In fact, considering language as language has become a marginal activity in U.S. schools
at all levels, including teacher education (Wong-Fillmore & Snow, 2005). The literature suggests that teachers in particular need to be comfortable and competent with the linguistic elements of English and the processes of first and second language learning to be competent teachers of ELLs and, in fact, of all students. We believe there is an urgent need to reconsider the trivialization of the study of language in U.S. schools—from elementary school through college.

The final theme we highlight is that of collaboration. Some efforts to prepare classroom teachers to teach ELLs treat collaboration as a defining feature, as we discussed in the previous section. But, at some level, the sharing of expertise and hard work cuts across all the strategies we discussed. One reason the preparation of teachers to teach ELLs remains in the shadows is that the education of ELLs is perceived as something special, not part of the routine responsibilities of mainstream teachers. Therefore, faculty in mainstream pre-service teacher education programs generally have not seen it as their responsibility to prepare teachers to teach ELLs, nor do most teacher educators have the expertise to do so. Similarly, faculty in TESL or bilingual education programs have not thought of themselves as responsible for preparing mainstream teachers. This same specialization characterizes K-12 schools; regular classroom teachers, ESL teachers, and bilingual teachers are seen as having very different roles and responsibilities. Educating ELLs in mainstream classes requires collaboration across these institutional and professional boundaries. Collaborations might involve higher education faculty in different departments (e.g. linguistics, English, and curriculum and teaching) jointly designing and teaching a course in Linguistics for Educators. Retired ESL and bilingual teachers might mentor current ESL and bilingual teachers, who in turn serve as peer mentors for classroom teachers in their schools. A group of classroom teachers might form a study group and conduct peer observations to develop their knowledge and skill for teaching ELLs, serving as “a community of critical friends” (Nieto, 2000, p. 204). Whatever the particulars, collaboration is essential for providing challenging and appropriate education for ELLs in regular classrooms.

From our review of the literature, we have drawn some recommendations for policy. First, a coordinated effort is needed to collect relevant language data about teachers, teacher candidates, teacher educators, and language education. We were unable to locate comprehensive data on teachers’ native languages, their levels of proficiency in languages other than English, their experiences studying foreign/second languages (how long they studied, in what contexts, through what methods, at what ages), their experiences traveling and living for extended periods of time in other countries, and their exposure to language minority groups in the U.S. While periodic data collection efforts such as The Schools and Staffing Survey (e.g. NCES, 1997) and The Descriptive Studies of LEP students (Fleischman & Hopstock, 1993; Zehler et al., 2003) provide some language-related information about teachers, we believe more such data should be collected routinely at the national level. Similarly, language-related data on teacher candidates and teacher educators should be routinely collected. Zeichner (2005) has called for the construction of a national data set about teacher education candidates and teacher educators; such a data set must include the kinds of information about language we have listed above.

Second, funding is needed to support innovative pre-service and in-service efforts to develop classroom teachers’ knowledge, skills, and dispositions for teaching ELLs. Five of the reports of pre-service and in-service initiatives described in the previous section were developed with federal funding (Bermúdez et al., 1989; Costa et al., 2005; Levy et al., 2002; Nevárez et al., 2005; Sakash & Rodriguez-Brown, 1995), and one wonders if they would have taken place at all without the funding. If already over-burdened faculty must initiate and implement innovations without additional funding, it seems safe
to assume that there will be fewer of them, they will be less comprehensive, and less data will be collected through formal evaluations than if these innovations receive external funding.

Finally, we recommend that teacher educators advocate for an additional endorsement or certificate at the state level, following the now-defunct model of the CLAD certificate in California. Such a certificate may be premature in states with very few ELLs or with highly concentrated linguistic minority populations, but in several states ELLs are already a notable presence in mainstream classes. Realistically, it will be many years before teacher education programs or school districts make the necessary adjustments on their own to ensure that all teachers have the knowledge, skills, and dispositions to teach ELLs successfully. If states require that teachers of ELLs complete a specified number of credits or hours focused on the education of ELLs, teacher educators will have the support, motivation, and funding (through tuition) to make the needed changes.

We now turn to our recommendations for research, many of which echo the recommendations of Zeichner (2005) for the development of a research agenda for teacher education as a whole. We identified 17 reports of empirical studies related to the preparation of teachers to teach ELLs that met our criteria for selection. Eight of them focused directly on such preparation, and three of those involved large-scale surveys. Nine studies were indirectly related to teacher preparation, six of which examined teachers’ attitudes and beliefs—the only area in which there was evidence of a body of research. Thirteen were published in peer review journals, one was a book chapter, one was prepared for the U.S. Department of Education, one was prepared for three policy organizations in CA, and one was a paper presented at AERA. Consistent with other research on teacher education, several of the studies (seven) were done at the researchers’ own institutions and focused on their own students. Even assuming that we failed to include every relevant study and acknowledging the rigor of many of these studies, this body of work is sadly inadequate. Research is needed in every area.

We believe, therefore, that the first priority should be to conduct research to get a better sense of where we are starting from. While the published studies and descriptions of initiatives we identified are heartening, they leave us wanting a comprehensive and systematic study of what is now being done to prepare classroom teachers to teach ELLs. Nationally, how many institutions of higher education are taking steps to prepare pre-service and in-service teachers for ELLs? What are the characteristics of such efforts? What structural and process strategies are being used? What are the “curriculum and instructional practices and organizational arrangements” of these initiatives (Zeichner, 2005, p. 21)? How do these characteristics and strategies vary by institutional context? What are the characteristics of those who are teaching in these programs? Gathering descriptive data on in-service initiatives not associated with IHEs poses great challenges given the more diffuse and unregulated nature of most professional development. But we need to find ways to identify in-service initiatives and to gather descriptive data about them as well. Once descriptive data have been collected about pre-service and in-service initiatives, a series of detailed case studies of a representative sample of those initiatives could be conducted to provide “rich descriptions of what . . . the programs actually do to address cultural and linguistic diversity” (Maxwell-Jolly & Gándara, 2002, p. 60).

Beyond such descriptive studies, research that examines the implications and impacts of the various efforts to prepare classroom teachers to teach ELLs is needed. What are the impacts on teachers’ experiences, dispositions, knowledge, and skills? On their teaching practices? On the learning of the ELLs in their classes? In addition, variations in outcomes related to program characteristics and to institutional and community contexts need to be studied. How do outcomes vary according to the different strategies,
characteristics, and models used? For example, “do teachers prepared in a program that gives greater emphasis to the role of culture function differently than those in programs giving more importance to language issues” (Merino, 1999, p. 245)? What is the relationship of the sociocultural context of institutions and communities to the extent to which and ways in which teachers are prepared to teach ELLs, and to their outcomes (Walker et al., 2004; Zeichner, 2005)?

Research is also needed on teacher educators who are attempting to prepare teachers to teach ELLs through both pre-service and in-service initiatives at IHEs, in school districts, and in other contexts. We need to understand the relationship between the characteristics of teacher educators, what they teach, how they teach, and how successful they are. How do their personal backgrounds and experiences, their linguistic and cultural knowledge and expertise, and their professional knowledge and skills influence their practices and the learning of their students? As Zeichner (2005) posed the question: “... How do various demographic and quality indicators associated with teacher educators ... influence the character and quality of instruction in teacher education programs” (p. 20)?

Finally, with regard to research methods, we want to echo Zeichner’s (2005) recommendations that the peer review process be strengthened so that published research meets more rigorous standards and that greater attention be given to preparing educational researchers and to mentoring beginning researchers. We reviewed many reports of empirical work that were lacking clearly articulated research questions, a coherent theoretical framework, an adequate explanation of the research design or data collection procedures, an explanation of how the sample was selected, and/or a description of the context for the research. We read reports in which the implications did not logically grow out of the study findings. To enhance the credibility of research on preparing teachers in general, and preparing them to teach ELLs in particular, we in the research community must hold ourselves accountable for producing high quality research and reports of that research.

When we began writing this chapter, we imagined that we would end with recommendations for practice. What steps do we suggest teacher educators take to prepare classroom teachers to teach English language learners? Now that we come to our final comments, however, we feel it is premature to make recommendations for the design of pre-service and in-service programs to prepare classroom teachers to teach ELLs. The examples included in the chapter can provide inspiration and direction. But without research to examine the functions and outcomes of these strategies, we have no basis on which to recommend one over the other or to suggest that one strategy is more successful in one context or with one population than another. Therefore, we conclude by expressing our hope that educators will recognize the urgency to bring the education of English language learners in mainstream classes out of the shadows. The extent to which teachers are prepared to teach all students reflects the value we place on the education of all students. It also plays a major role in determining the quality of life of individuals and groups within our society. The academic success and future life possibilities of ELLs depend to a large extent on the assistance and quality of instruction they receive in mainstream classes. To continue to deny them the best teachers possible is to turn our backs on our professional responsibilities as educators.

ACKNOWLEDGMENT

The authors would like to thank Julie Maxwell-Jolly, University of California, Davis, for her comments on a draft of this chapter, and Revital Israeli, Tamara’s Graduate Assistant at Montclair State University, whose assistance was invaluable.
NOTES

1 In this chapter, we use the terms mainstream classroom and regular classroom to refer to classes that assume students are native English speakers. This is in contrast to special classes (ESL or bilingual classes) designed for ELLs.

2 Abramson et al., 1993; Evans et al., 2005; Gándara et al., 2005; Hyatt & Beigy, 1999; Menken & Antunez, 2001; Rhine, 1995; Torok & Aguilar, 2000; Zetlin et al., 1998.

4 The official term used in government documents for speakers of other languages who are not yet proficient in English is limited English proficient (LEP).

5 The survey did not make a distinction between linguistic minority students and culturally diverse students, so it is impossible to determine teachers’ feelings of preparedness related only to teaching ELLs.

Artifacts
5.1 Is assimilation dead?

Nathan Glazer

Assimilation is not today a popular term. Recently I asked a group of Harvard students taking a class on race and ethnicity in the United States what their attitude to the term “assimilation” was. The large majority had a negative reaction to it. Had I asked what they thought of the term “Americanization,” the reaction, I am sure, would have been even more hostile. Indeed, in recent years it has been taken for granted that assimilation, as an expectation of how different ethnic and racial groups would respond to their common presence in one society or as an ideal regarding how the society should evolve or as the expected result of a sober social scientific analysis of the ultimate consequence of the meeting of people and races, is to be rejected. Our ethnic and racial reality, we are told, does not exhibit the effects of assimilation; our social science should not expect it; and as an ideal, it is somewhat disreputable, opposed to the reality of both individual and group difference and to the claims that such differences should be recognized and celebrated.

One might think there is nothing left to say. The idea that it would happen, that it should happen, has simply been discredited, and we live with a new reality. It was once called cultural pluralism, it is now called multiculturalism, and whatever the complications created by the term for educational policy; or for public policy in various other realms, that is what we must live with, and all of us must be ranged along a spectrum of greater or lesser enthusiasm and acceptance of the new reality. Even critics of the new multiculturalism take their place within this spectrum. Those who truly stand against it, the true advocates and prophets of a full assimilationism, are so minuscule in American public and intellectual life that they can scarcely be discerned in public discussion. One can point to the journal Chronicles and scarcely anything else. Neither liberals nor neoliberals, conservatives nor neoconservatives, have much good to say about assimilation, and only a branch of paleoconservatism can now be mustered in its defense. It is only they who would agree that even if it has not yet happened, it is something that, despite the reverses of the past thirty years, should have happened and should still happen.

My purpose is not to present a eulogy over a dead hope or demeaning concept. It is rather to argue that properly understood, assimilation is still the most powerful force affecting the ethnic and racial elements of the United States and that our problem in recognizing this has to do with one great failure of assimilation in American life, the incorporation of the Negro, a failure that has led in its turn to a more general counterattack on the ideology of assimilation.

THE HISTORY OF AN IDEA

But to go back: what was assimilation? It was the expectation that a new man would be born, was being born, in the United States. We can go back to that much quoted comment on what was the American, in Crevecoeur’s Letters from an American Farmer of 1782:

What then is the American, this new man? He is either a European or the descendant of a
European, hence that strange mixture of blood, which you will find in no other country. I could point out to you a family whose grandfather was an Englishman, whose wife was Dutch, whose son married a French woman, and whose present four sons have four wives of four different nations. He is an American, who, leaving behind him all his ancient prejudices and manners, receives new ones from the new mode of life he has embraced, the new government he obeys, and the new rank he holds.¹

This passage, which Philip Gleason tells us “has probably been quoted more than any other in the history of immigration,” has, of course, been generally cited to celebrate American diversity and the general acceptance of this diversity as forming the basis of a new nation, a new national identity, but in 1993 we will look at it with more critical eyes and note what it does not include as well as what it does: there is no reference to Africans, who then made up a fifth of the American population, or to American Indians, who were then still a vivid and meaningful, on occasion menacing, presence in the American world. In this article, I will refer to many other passages that to our contemporary eyes will express a similar surprising unconsciousness, or hypocrisy, or unawareness. Today we would cry out, “There are others there you are not talking about! What about them, and what place will they have in the making of the new American?”

The concept of assimilation looked toward Europe. It referred to the expected experience and fate of the stream of immigrants who were a permanent part of American life and consciousness from the time of the first settlements on the Atlantic seaboard to the 1920s, when it was thought—incorrectly—that we were now done with mass immigration of varied backgrounds to the United States.

There has been a good deal of discussion of a major characteristic of the emerging American national consciousness, or, we would say today, the emerging American identity. That is, that in many authoritative formulations, from the Declaration of Independence on, the American, the new nationality being formed here, is not defined ethnically, as deriving from an ancient common stock or stocks, as almost all other major modern nations define themselves. I may point out as an aside that while the term “identity” is almost essential in any discussion of this emerging American national character, it is a relative latecomer to the discussion. Philip Gleason tells us,

The term “identity” has become indispensable in the discussion of ethnic affairs. Yet it was hardly used at all until the 1950’s. The father of the concept, Erik H. Erikson, remarked on its novelty in . . . Childhood and Society (1950): “We begin to conceptualize matters of identity . . . in a country which attempts to make a super-identity of all the identities imported by its constituent immigrants.” In an autobiographical account published 20 years later, Erikson . . . quoted this passage and added that the terms “identity” and “identity crisis” seemed to grow out of “the experience of emigration, immigration, and Americanization.”²

Many could be quoted on this surprising characteristic of American identity, its avoidance of explicit ethnic reference. Despite the fact that the American revolution was fought almost exclusively by men who traced their origins to the British Isles, and primarily to England, and that the signers of the Declaration of Independence and the framers of the Constitution were almost exclusively of this stock, they did not define their Americanness as an ethnic characteristic. They emphasized its dependence on adherence to ideals, to universal principles. Perhaps, as Gleason points out, this was because it was necessary for the rebels and revolutionaries to distinguish themselves from the ethnically identical country against which they were rebelling. But in any case, the ideological formulation of the definition of the American was there at the beginning. Years ago I quoted Hans Kohn, Yehoshua Arieli, and S. M. Lipset on this characteristic of American identity.³ One could add other voices. As Gleason writes,
The ideological quality of American national identity was of decisive importance, vis-à-vis the question of immigration and ethnicity. To become an American, a person did not have to be of any particular national, linguistic, religious, or ethnic background. All he had to do was to commit himself to the political ideology centered on the abstract ideals of liberty, equality, and republicanism. Thus the universalist ideological character of American nationality meant that it was open to anyone who willed to become an American.4

As anyone writing in 1980 must be, he is aware of the exclusions, not remarked on by the writers of those early ringing documents, perhaps exclusions of which they were not even aware, the blacks and Indians and, later, groups not in the beginning present in the new United States. Certainly, even if not specifically excluded, they were not intended to be included in these ringing affirmations of universality.

One could find here and there before the 1940s a few voices of significance who seem to make no exclusion. There was Emerson in 1845:

In this continent—asylum of all nations—the energy of Irish, Germans, Swedes, Poles, and Cossacks, and all the European tribes,—of the Africans, and of the Polynesians,—will construct a new race, a new religion, a new state, a new literature, which will be as vigorous as the new Europe which came out of the smeltingpot of the Dark Ages.5

There was Whitman. But one can ask even of Emerson, Did he mean it? What did he know of Polynesians, after all? And one can ask of the term he introduced to characterize the assimilation of the different elements, the “smelting pot,” later to achieve fame in this discussion in the form of the “melting pot,” Was that not too brutal, too strong, a metaphor for what was to be lost, to disappear, in order to make this new race? The groups were to be more than melted, smelted, as in two or more metals becoming one (the Emerson passage begins with a reference to “Corinthian brass”). But for the moment ignoring the question of whether assimilation was too strong a demand, it is necessary to focus on who was to be assimilated.

FORGETTING THE BLACKS

In almost all the discussion of Americanization or assimilation until about World War II, the discussants had only Europeans in mind. This is true whether they favored or opposed assimilation and Americanization efforts. A reader today of the documents of the great Americanization drive of the second decade of this century will find no reference to blacks, then as now our largest minority. It is as if the turmoil of abolitionism, slavery, the Civil War, Reconstruction did not exist. All concern was with the “new” immigrants, that is, the mass immigration from Eastern and Southern Europe that brought enormous numbers of kinds of Europeans different from those the nation had become accustomed to. Admittedly, one could make the argument that “Americanization,” the name of the assimilation movement of the time, could address only those who were not Americans, and were not blacks American-born and formally citizens? So, one could argue, this was the reason they were ignored in the great debate that finally degenerated into a resurgent Ku Klux Klan and the closing of the gates to the new immigrants.

Yet, when one looks at the aims of the Americanization movement, one asks, And why not blacks, too? The aims of the movement, in its earlier, benign form, were to make the newcomers citizens and encourage them to participate as individuals in politics (as against their domination by urban bosses), to teach them English (and here one main argument was to make them better and safer workers, in view of the huge toll of industrial accidents), to break up immigrant colonies (“distribution” it was called), and to teach American customs, which meant primarily sanitation
and hygiene. All this would make the immigrants better Americans. One major motivation was concern that the new immigrants would not become good Americans, owing to lack of English, citizenship, and knowledge of American customs. With World War I, to this motivation was added fear of lack of patriotism or disloyalty. But the vigorous advocates of Americanization—social workers and businessmen, a strange mix that nevertheless characterized much of the progressivism of the time—were also trying to plead the case of the new immigrants against the arguments of their countrymen who increasingly favored immigration restriction. The social workers, we know, pled this case out of understanding and sympathy for the new immigrants; the businessmen, we may assume, out of self-interest, much as the Wall Street Journal of today argues for free immigration. But if these were the aims of the Americanization movement, why were not the blacks included?

Their exclusion is even more striking to the current reader in view of the language of the time, in which ethnic groups are referred to as “races”—but the first group that comes to mind when we speak of “race” today is not in the minds of these earnest and energetic advocates of assimilation and Americanization.

Consider one of the most authoritative statements of what was hoped for from Americanization, from Frances Kellor, a progressive woman social worker who was the heart and soul of the movement, indefatigably organizing committees, conventions, statements, programs:

Americanization is the science of racial relations in America, dealing with the assimilation and amalgamation of diverse races in equity into an integral part of the national life. By “assimilation” is meant the indistinguishable incorporation of the races into the substance of American life. By “amalgamation” is meant so perfect a blend that the absence or imperfection of any of the vital racial elements available, will impair the compound. By “an integral part” is meant that, once fused, separation of units is thereafter impossible. By “inequity” is meant impartiality among the races accepted into the blend with no imputations of inferiority and no bestowed favors.6

This is a late statement, made when the movement was taking on a harsher tone, and rather stronger than we would find from most advocates of Americanization, in particular in the emphasis on “amalgamation,” which can only mean intermarriage to the point of the indistinguishability of any distinct group. My concern here, however, is with the remarkable absence of the blacks, despite the continual emphasis on the word “race.”

One of the early climaxes of the movement was a great meeting in Philadelphia, on 10 May 1915. Woodrow Wilson addressed a huge throng—5,000 newly naturalized citizens, 8,000 previously naturalized, a chorus of 5,000 voices, and the like. He does not use the term “race” in his paean to the all-inclusiveness of America, but all races are clearly implied in his term “the people of the world”:

This is the only country in the world which experiences this constant and repeated rebirth. Other countries depend upon the multiplication of their own native people. This country is constantly drinking strength out of new sources by the voluntary association with it of great bodies of strong men and forward-looking women out of other lands . . . It is as if humanity had determined to see to it that this great Nation, founded for the benefit of humankind, should not lack for the allegiance of the people of the world.7

But we might again ask, Where were the blacks? Clearly, Wilson did not have them in mind.

This great meeting was the prelude to Americanization Day on 4 July 1915, when many meetings to welcome new citizens were held all over the country. One of them was in Faneuil Hall in Boston, addressed by Justice Louis Brandeis. He asserted that what was distinctly American
was "inclusive brotherhood." America, as against other nations, "has always declared herself for equality of nationalities as well as for equality of individuals. It recognizes racial equality as an essential of full human liberty and true brotherhood. . . . It has, therefore, given like welcome to all the peoples of Europe." He did not seem to have blacks in mind.

Most ironically, we find that one of the most active of the postwar Americanization groups was the Inter-Racial Council. We know what the name of the council would mean had it been used 20 years later. But in 1919 it struck no one as odd, apparently, that it did not refer to blacks and that it did not include blacks. Among a host of names of leading businessmen and bankers and political dignitaries we find some prominent immigrant names—Dr. Antonio Stella, M. I. Pupin, Gutzon Borglum, Jacob Schiff—but none belonging to blacks.

As the Americanization movement began to shift from one befriending the immigrant, bringing him closer together to Americans, to one that seemed increasingly hostile, in which the generous offer of citizenship and full participation became the compulsory demand that the immigrant must learn the English language and American government, the Carnegie Corporation, trying to defend the earlier openness toward the immigrant, in the spirit of Jane Addams and Lillian Wald, sponsored a series of Americanization studies. Once again the language will surprise in its unconsciousness of the fact that "race" might include other than Europeans. In James A. Gavit's *Americans by Choice* on the issue of naturalization, we find again the argument with which we are familiar: that the American is not defined ethnically but by allegiance to an ideology. "The American Has No Racial Marks," one subtitle asserts. The text continues,

This absence of exclusive racial marks is the distinguishing physical characteristic of the American. True of him as of no other now or ever in the past is the fact that he is, broadly speaking, the product of all races . . .

We are in the midst of the making of the "American." He does not yet appear what he shall be but one thing is certain, he is not to be of any particular racial type now distinguishable. Saxon, Teuton, Kelt, Latin and Slav—to say nothing of any appreciable contribution by yellow and brown races as yet negligible . . .—each of the races that we now know on this soil will have its share of "ancestorial" responsibility for the "typical American" that is to be.

The next heading reads, "Not Racial, But Cultural." Dealing as he does with naturalization, Gavit cannot, as more celebratory advocates of Americanization can, totally ignore the racial aspect: naturalization was racially limited. He does write:

It is not yet true—perhaps it will be very long before it can be true—that there is absolutely no bar to any person on account of race; for the law and its interpretations exclude from citizenship Chinese, Japanese, and certain people of India not regarded as "white"—although the blacks of Africa are expressly admitted. Nevertheless, it may be said broadly that regardless of race, the immigrant can come to America and win his way upon his own merits into the fellowship all the world calls "Americans."

As we know, the Americanization movement lost its aspect of welcome and inclusion in the midst of the passions aroused by World War I and the postwar fear of Bolshevism and radicalism. It turned into something harsh and oppressive, in which the issue became less the opportunity to learn English than the insistence that nothing but English be learned; less the generous offer of citizenship than the widespread fear of subversion from aliens and naturalized citizens. Americanization developed a bad name among liberals. Insofar as there was still concern for the living and working conditions of immigrants, this became encompassed in a larger liberal movement for improving the conditions of working men, a movement that was easily capable of
reconciling commitment to the cause of working people with opposition to further immigration. If the word “assimilation” now makes us suspicious, and “Americanization” even more so, among the older and more knowing it may be because of the excesses of the 1920s.

“Americanization” is no longer to be found in encyclopedias of the social sciences, but it does appear in the first great Encyclopedia of the Social Sciences of 1930, and the comment we find there on the fate of Americanization will to some extent explain to us why we do not hear much about it today:

This emphasis on the learning of English and naturalization, together with the unfortunate atmosphere of coercion and condescension in which so many war time Americanization efforts were conceived, had the effect of bringing the word into a disrepute from which it has never fully recovered. Contributing to the same result, in the period following the war, were the widely expressed fear and suspicion of the immigrant, his frequent indictment as a radical, attempts to suppress his newspapers and organizations, the ignoring of his own culture and aspirations, the charge that certain nationalities and races were inferior and unassimilable, and the use of intimidating slogans. Americanization work too frequently made the assumption that American culture was something already complete which the newcomer must adopt in its entirety. Such attitudes and activities were important factors in promoting restriction of immigration, but they did not advance the assimilation of the immigrants who were already in America.

THE LIMITED VISION OF CULTURAL PLURALISM

But the point of this recital of the history of Americanization is not to add to the extensive literature that explores the neglect of and ignoring of the key question of the treatment of blacks in American society, nor to argue—although it is true—that immigrants were better treated and taken more seriously from the point of view of their inclusion in American society, nor to attack the Americanization movement for its excesses—all legitimate responses to it. It is to set the stage for something that has also received little attention: that the critics of Americanization and assimilation had little to say about blacks. However passionate in their defense of the contribution to American economy, culture, and politics of immigrants and immigrant groups, however strong in their resistance to the demand for assimilation, whatever arguments they raised in resistance to the expectation of assimilation, the critics—let us call them for convenience the “cultural pluralists,” for it was they who raised the strongest objections—had little to say, indeed nothing to say, about adding blacks to the series of groups who they felt had every right to maintain their separate identity. Maybe they believed blacks should; maybe they never thought of them: they just never entered them into the argument.

There were, of course, critics of Americanization. There were fewer during its earlier, more benign form; more when it evolved under the pressures of war into an attack on “hyphenated Americanism,” led by former President Theodore Roosevelt; more when it further evolved into the repression of the postwar years, through laws restricting aliens and imposing English, through administrative actions expelling aliens, through waves of public opinion against further mass immigration from Europe, and into the mass hysteria of the Ku Klux Klan and similar organizations. But those few voices of cultural pluralism that were then raised, and that we have in recent decades disinterred, had almost nothing to say about blacks in their celebration of a possible “Transnational America,” as in Randolph Bourne’s phrase, in their attack on the critics of “hyphenated Americanism,” in their insistence that each group, each “race,” in the language of the time, had an inherent genius or character that should not be suppressed but allowed to flower, as in the argument of Horace Kallen. We search this modest literature in vain for any reference to black Americans.
Thus, when John Dewey spoke to the National Education Association in 1916 to defend the value of cultural pluralism, he did not seem to have blacks in mind. Of course, he was speaking in the context of an attack on the loyalty of Europeans. Nevertheless, one would have thought that America’s largest minority might have entered into the discussion. Many groups were mentioned in his talk:

Such terms as Irish-American or Hebrew-American or German-American are false terms, because they seem to imply something which is already in existence called America, to which the other factors may be hitched on. The fact is, the genuine American, the typical American, is himself a hyphenated character. It does not mean he is part American and some foreign ingredient is added. It means that . . . he is international and interracial in his make-up. He is not American plus Pole or German. But the American is himself Pole-German-English-French-Spanish-Italian-Greek-Irish-Scandinavian-Bohemian-Jew-and so on.14

One searches Horace Kallen’s *Culture and Democracy in the United States*, the fullest statement of the cultural-pluralist view of the time, almost in vain for any reference to blacks. They cannot be fully escaped: after all, the introductory chapter is titled “Culture and the Ku Klux Klan,” and Negroes are listed as among its targets. There are two other slightly fuller references. In speaking of the spirit of Know-Nothingsm, he writes,

What differs from ourselves we spontaneously set upon a different level of value. If it seems to be strong it is called wicked and is feared; if it is regarded as weak, it is called brutish and exploited. Sometimes, as in the attitude toward the negro [sic], the emotions interpenetrate and become a sentiment focalizing the worst qualities of each.

There is one more reference. Kallen is concerned in this passage with whether the current hysteria will wane, the integration of immigrants into American life under a liberal regime will continue (here “integration” clearly does “not mean “assimilation”). But it may not happen. The immigrant may be fixed in the inferior economic position he now holds: “One need only cast an eye over the negro-white relations in the South to realize the limit that such a condition would, unchecked, engender.”15 Perhaps it is reading too much into very little, but one detects in this passage no expectation that there will be much change in this condition.

The significance of this episode in the history of American thinking about race and ethnicity is that the argument over assimilation and Americanization evoked by the mass immigration of the period 1880–1924 and by the pressures of World War I simply did not take blacks, let alone Mexican Americans or Asians, into account.

Thus the evolution of the argument did not take account of the groups that came in time to stand for both American minorities and immigrants. After World War II, Europeans did not stand for either. Discrimination against European groups declined rapidly after World War II. Thus they began to lose their status as minorities. Immigration, when it recovered after World War II, encompassed a rather modest stream of Europeans. When it grew, after 1965, into a volume rivaling that of earlier periods of mass immigration, it included very few Europeans: it became an immigration predominantly of Asians of varying nations, of Latin Americans of many nations, of Caribbean blacks of many nations. The European component was reduced to a small fraction.

Now blacks and others had to be included in the discussion. As something like cultural pluralism began to raise its head again with the coming of Hitler and the fear of a future war, the growing concern was no longer with European immigrants alone, as it was in the buildup to World War I. Americans generally and security agencies specifically were concerned about German American adherents of Nazism, with Italian adherents of Italian Fascism—many fewer than Nazi adherents—and most with Japanese Americans, who were the only group to be affected by a
World War I-style hysteria. There was, then, a reprise to some extent of World War I concern with immigrant loyalty. Indeed, we even had a revival of something like the Americanization Day spectacles of the earlier period in the creation and brief history of “I Am an American Day.” But the tone of the new movement was different in some key respects.

First, mass immigration had come to an end, and no one expected it to revive, whatever the needs of persecuted Jews and other groups harried by the Nazis. Perhaps this explains a greater degree of benignity.

But second, blacks and Hispanics and Asians were now definitely part of the story. Because we were fighting Hitler and his ideology of racial superiority, we had to take into account our own groups of racially defined second-class citizens, all suffering under a weight of legal as well as informal segregation, discrimination, and prejudice. Cultural pluralism, which had been in World War I and its aftermath only the evanescent hope of a few philosophers and journalists, became a sturdy growth, under a new name, intercultural education. The focus began to shift, from European immigrant groups to minorities of color. European immigrant groups were already well on the way to assimilation. In addition, Hitler had antagonized so many of them that disloyalty did not seem the great problem it had appeared in World War I; suspicion touched only the Japanese. And in fighting the ideology of race—physical race, biological race—how could we not be concerned with how we treated our racial minorities?

What was to be the fate of assimilation in this new dispensation? Whatever the new degree of tolerance for diversity, it was generally expected that assimilation would continue. Intercultural education was a far cry from a full-bodied cultural pluralism and presented no resistance to assimilation. It stood for tolerance, not for the maintenance of cultural difference and identity. Indeed, even if the term was not used, assimilation was what the advocates for our largest and most oppressed minority also wanted. 16

WAS ASSIMILATION INEVITABLE?

The term “assimilation” was a key concept in the thinking of our most important sociologist of race and ethnicity, Robert E. Park, founder of the school of sociology at the University of Chicago, which went deeply into questions of race and ethnicity. Park and his colleagues had participated in the Carnegie Americanization studies I have referred to. Opponents of forceful Americanization, they nevertheless believed social trends were bringing an inevitable assimilation. They did not decry this; rather, they felt that this was the unavoidable result in time of the meeting of peoples. Park saw that the great problem in the way of assimilation was the blacks.

His 1930 article on assimilation in the Encyclopedia of the Social Sciences perceptively points to this as the stumbling block in the way of assimilation:

> In a vast, varied and cosmopolitan society such as exists in America, the chief obstacle to assimilation seems to be not cultural differences but physical traits. . . . The Negro, during his three hundred years in this country, has not been assimilated. This is not because he has preserved in America a foreign culture and alien tradition. . . . no man is so entirely native to the soil. . . . To say the Negro is not assimilated means no more than to say that he is still regarded in some sense a stranger, a representative of an alien race. . . . This distinction which sets him apart from the rest of the population is real, but is not based upon cultural traits but upon physical and racial characteristics."

As for Europeans: “The ease and rapidity with which aliens have been able to take over American customs and manners have enabled the United States to digest every sort of normal human difference, with the exception of the purely external ones like that of the color of the skin.” 17
Park saw the key problem. Of course, he was not alone. Black intellectuals and leaders also saw where they stood. They were not even participants in the debate over assimilation and Americanization. Nevertheless, they strove for assimilation, or, rather, for the rights that they assumed would lead to assimilation. American liberals generally, supporters of black aims, saw no argument against assimilation in principle, for all groups. Park had set forth a scheme, which became quite influential in sociology, in which groups in contact moved through various phases, such as conflict and accommodation, ending in assimilation. Fifteen years ago, pondering the rise then of an earlier phase of multiculturalism, I noted this assimilationist stance of both sociologists who studied race and ethnicity and black scholars and leaders.

Park and his leading students, I pointed out, while they did not put forth their preferences sharply, assumed assimilation was not only inevitable but would be all for the best. Thus

Louis Wirth, who was the chief successor to Park, made clear in *The Ghetto* that his preference was for assimilation: the Jew continued to exist only because of prejudice and discrimination; all the reactions of the Jew to this antagonism were humanly limiting; and assimilation, which to be sure required lowering the barriers to assimilation, was the desirable end result of the interaction of Jews and non-Jews in contemporary society.

The major works of E. Franklin Frazier on the black family went in the same direction. Insofar as the black family was stable and puritanical it was good—that was unquestioned. There was no hint, or scarcely any, that any distinctive cultural feature should survive as specifically Negro or black, or that there should be any effort to seek for such features.

This was not cultural arrogance or imperialism; instead, it was the point of view of the best-informed, most liberal, and most sympathetic analysts of the ethnic and racial scene. Assimilation was a desirable consequence of the reduction of prejudice and discrimination, while acculturation, that is, becoming more like the majority, would contribute to the reduction of discrimination and prejudice. This was the dominant liberal view until at least the 1950’s.

It was also the view, insofar as a view could be discerned, of the representatives of racial and ethnic groups. The NAACP and the Urban League were clearly “assimilationist.” Although it was clear that blacks could never because of race be indistinguishable from whites, it was desirable that they become culturally, socially, economically, and politically assimilated, that they be simply Americans with dark skins. All public agencies, including the government and the schools, and all private agencies that affected individual circumstances, including banks, businesses, housing producers, and landlords, were to be “color blind.” In the 1950’s the only legitimate form of differentiation proposed for American life was religious . . .

Admittedly, in each group there were the maintainers and upholders of the ethnic conscience and consciousness, including schools, churches, philanthropic and civic organizations, networks of insurance societies, and social groups, but except by those whose direct interest was in maintaining them and the jobs they offered, these were regarded as survivals, fated to fall away as acculturation and assimilation progressed.

Acculturation and assimilation, if not the cruder “Americanization,” were thus not simply the positions of the old Americans who were antagonistic to new immigrants and non-white races; they were also the positions of those who were most sympathetic to these groups and who understood them best, and even of the representatives of these groups.18

Of course, as we know, we are now very far from all this. The voices of opposition to integration burst out in the late 1960s and have gone through many permutations since. Bland intercultural education has succumbed to the rather more forceful multicultural education—though that too comes in all brands, from the mildest recognition of differences to a rather hysterical and irrational
Afrocentrism. We even had, in the late 1960s and 1970s, a brief explosion of revived ethnic assertiveness among white European ethnic groups, the heirs of the immigrants of the early decades of the century. It could not survive; assimilation had gone too far. We have a few modest programs in Italian American studies, and a sturdier growth of Jewish programs, which are able to draw not only on ethnic attachments that tend to be stronger than that for most white Europeans but also on religion, which creates a firmer body of institutions to parallel the purely ethnic and which has greater prestige and receives more tolerance in the American setting.

We come now to our question: is assimilation then dead? The word may be dead, the concept may be disreputable, but the reality continues to flourish. As so many observers in the past have noted, assimilation in the United States is not dependent on public ideology, on school curricula, on public approbation; factors in social and economic and cultural life foster it, and it proceeds apace. Read Lewis was right when, in his article on Americanization in the Encyclopedia of the Social Sciences, now more than sixty years old, he wrote:

> Important as these conscious efforts are toward Americanization, they represent only a part of the social forces which play continuously upon the immigrant and determine the degree and rapidity of his assimilation. A conspicuous force which makes for adjustment is the urge to material success, which makes the immigrant adapt himself to American ways of work and business. This usually involves learning the English language as quickly as possible. Standardizing forces such as national advertisements, ten-cent store products, movies, radio and the tabloid press play also upon the immigrant.19

Correct for inflation, add television, baseball, football, basketball, and so on, and it is clear that the forces pressing assimilation have not lost power.

Call it "acculturation" if you will. But assimilation in its least deniable and strongest form, what was once called "amalgamation," also proceeds apace. The rates of intermarriage among all European ethnic groups is very high.20 Even Jews, with their bar against intermarriage posed by religion, and who maintained a rather low rate of intermarriage through the 1940s, now show the very high rates at which individuals commonly marry outside their ethnic group, however defined. With these high rates in the postwar period, it is hardly clear what one’s ethnic group is and how it is to be defined. Mary Waters, in Ethnic Options, shows how thin any sense of ethnicity among Americans of European origin has become.21 But there is the great exception.

**SEPARATENESS**

If intermarriage is taken as key evidence for powerful assimilatory forces, then blacks are not subject to these forces to the same degree as others. Hispanic groups and Asian groups, despite the recency of the immigration of so many of them, and thus the greater power of family and group attachment, show rates of intermarriage approaching the levels of Europeans. Blacks stand apart, with very low rates of intermarriage, rising slowly. They stand apart, too, in the degree of residential segregation.22 Thirty years of effort, public and private, assisted by antidiscrimination law and a substantial rise in black earnings, have made little impact on this pattern.

This is not the place to explain all this, but the apartness is real. And it is this that feeds multiculturalism. For one group, assimilation, by some key measures, has certainly failed. For others, multicultural education may be a matter of sentiment. But most black children do attend black-majority schools. Most live in black neighborhoods. Why should not multiculturalism, in the form of the examination of group history, characteristics, problems, become compelling as one way of understanding one’s situation, perhaps overcoming it? The large statements of an American national ideal of inclusion, of assimilation, understandably ring false.
For Hispanics and Asian Americans, marked in varying degree by race, it is in large measure a matter of choice, their choice, just how they will define their place in American society. We see elements in these groups who, in their support of bilingual education and other foreign-language rights, want to establish or preserve an institutional base for a separate identity that may maintain some resistance to the forces of assimilation. For blacks, too, there are choices—we see the existence of choices in the writings of black intellectuals who oppose the stronger tendencies of multiculturalism. But the difference that separates blacks from whites, and even from other groups “of color” that have a history of discrimination and prejudice in this country, is not to be denied. It is this that is the most powerful force arguing for multiculturalism and for resistance to the assimilatory trend of American culture and of American society.

5.2 Impact of the 1954 *Brown v. Topeka Board of Education* decision on Black educators

*Samuel B. Ethridge*

The impact of the 1954 Supreme Court Decision on education on the employment of Black professionals for the first eleven years was absolutely devastating. In spite of a series of improvements, both in the laws and in enforcement efforts, the fallout from those devastating years (1954–1965) is being compounded alarmingly each year in the seventeen states covered by Brown.

In my opinion, there is a five-fold reason for this. First, the Judges had before them the question of inferior schools. (Subconsciously, this meant inferior teachers). Second, at that time judges were reluctant to invade the domain of the school boards and respected even their right to make errors in administration. Third, since the previous decisions in the field were against colleges and universities that had carried out Court orders, even though with great reluctance, the Court had no experience with the kind of massive resistance which the Decision would engender at the elementary and secondary levels. The fourth reason for the Decision’s devastating effects on teachers and students, as well, was the lack of information on the result of the orders. Fifth, the 1954 Decision was not really an education decision. It was the first in a long series of civil rights cases. I will treat each of these reasons separately.

**PSYCHOLOGICAL ATTITUDES OF WHITES AND SOME BLACKS**

The unconscious psychological attitudes of the lawyers, the judges and the expert witnesses did not take into account either the rights of students to an integrated staff or their right to non-racist texts and curriculum.

The language of the Decision, as well as the sociological evidence put before the Court, set the stage for twenty-five years of sacrifice on the part of Black educators in the South.

“Schools separated by race are inherently unequal,” translated by the average every day school board member, means “Black schools, no matter how good, no matter how well trained their faculties, are unequal.”

One of the questions asked by lawyers for the students was, “If two schools were in separate parts of town with teachers of equal experience and equal degrees, with equal facilities, could the Black students receive an equal education?”

The reply from the witness was, “No, the other neighborhood has better houses and a better surrounding. Therefore, they could not receive an equal education.”

At a national conference of Black teachers, one of the chief expert witnesses in the case told the audience, “If Black children have not learned, it is because Black teachers have not taught them and because Black principals have not seen that they were taught.” His solution was that the Black principals should be replaced by white principals who will see that they learn.
This kind of thinking set the stage for unceremonious dismantling of hundreds of Dunbars, Booker T. Washingtons, Lincolns, Phyllis Wheatleys, and Maggie Walkers around the South.

In 1965, a task force survey by the National Education Association concluded the following:

It is clear, that in the past, Negro teachers were employed specifically and exclusively for the purpose of teaching Negro pupils in segregated schools. Segregated schools required segregated faculties. Since Negro teachers were employed to teach Negro pupils, there were relatively few positions for Negro teachers in a school system with few classes for Negroes. In a system with no classes for Negroes, there were simply no positions for Negro teachers. It has been, and still is, widely assumed by many school board members that Negroes, both students and teachers, are intellectually inferior. From this specious premise, it follows that "quality education" can be obtained only when schools, even after being integrated, remain in spirit and often in name "white schools." White schools are viewed as having no place for Negro teachers.

The emphasis of these early suits on specific students and specific schools rather than on state systems and school districts revealed that both lawyers and judges had a lot to learn before the real intent of the Brown Decision could be implemented.4

In the eleven southern states, from 1954 to 1965, little integration of faculties took place in the vast majority of school districts. The border states of Oklahoma, Missouri, Kentucky, West Virginia, Maryland and Delaware, having few district concentrations of Black students, found it relatively easy to close most of the Black schools and send the children to the schools nearest to their homes. This resulted in the dismissal of more than 6,000 teachers and more than 50 percent of the Black principals between 1954 and 1965.5

RELENTANT JUDGES AND LAWYERS

In 1954, in Mobley, Missouri, fourteen fully certified Black educators, including one with a doctorate degree, were dismissed. All 125 white educators remained, including those white teachers who had only provisional certificates. The judge in the case ruled that the Mobley Board of Education had the "right to make that decision" even though he personally felt that it was the wrong thing to do.6

For ten long years, all cases involving Black educators charging discrimination were dismissed on the basis of the Mobley Decision.

In 1964, a similar incident occurred in Giles County, Virginia.7 The Virginia Teachers Association, headed by J. Rupert Picott, with the support of the NEA, brought suit against the County on behalf of all seven Black educators who were dismissed when the one Black school in the County was closed and the students sent to the school nearest their homes. Fortunately for the case, Giles County had experienced a number of school closings due to the school consolidation movement.

The judge put aside all of the testimony about the certification and excellent ratings of the Black teachers, waived aside the fact that the system had hired seven more white teachers than it needed the previous year, and ruled that the letter of dismissal indicating that the teachers and the principal were no longer needed because their school was closed was, in itself, discriminatory. He stated that teachers are hired by and work for the school system, not for a school, and that they should have been reassigned as had been the custom of the system in other school consolidation cases.

The case was appealed and upheld, and thus became the first in a series of cases that began...
to protect Black teachers against discriminatory dismissals. From this point, the legal emphasis began to shift to systems rather than to school and individuals. When the Civil Rights Act was passed, Black teachers rejoiced because we thought that at last we were protected. To our disappointment and chagrin, the original Guidelines for Desegregation of Schools (1966) contained no mention of teacher desegregation or the hiring, dismissal, or promotion of teachers. To add insult to injury, a young lawyer for HEW, in explaining the Guidelines, was quoted in the *Washington Post* as having said, “In a war there must be some casualties, and perhaps the Black teachers will be the casualties in the fight for equal education of Black students.”

As a participant in the 1967 conference to revise the HEW Guidelines, I had a single purpose: To convince David Seeley and his staff, and the HEW lawyers, that the 1954 Decision and the 1964 Civil Rights Act did not cancel the Bill of Rights or the 13th, 14th, and 15th Amendments for Black educators. It was no coincidence that the revised guidelines contained some language directly from the NEA Professional Rights and Responsibilities Commission position papers on the retention of teachers:

“Race shall not be a factor in the hiring, firing, promotion or demotion of staff.”

The Guidelines required that all teachers be considered for dismissal in case of surplus teachers and that dismissed teachers be recalled before new teachers be added.

The revised Guidelines, combined with less reluctance by the judges to intervene in staff decisions, began to slow the tide of mass dismissals.

In the Montgomery County, Alabama case, the judge agreed with attorneys that one should not be able to look at a faculty and decide for what race the school was meant. He ordered that the faculty in each school should represent within ten percent the ratio of Black to white teachers in the County. No school could have less than ten percent Black teachers and no school could have more than thirty percent of Black teachers in order to reflect the two-to-eight ratio.

In my opinion, the Decision after Mobley which had had the most impact on the employment of Black professionals is *Singleton v. Jackson Municipal District*. It is basically a decision for good, but it has been interpreted in ways which have reduced or limited the number of Black educators in small districts where white students have withdrawn and in large cities, like New Orleans and Memphis, where the Black population is increasing. It states that staff members who work directly with children, and professional staff who work on the administrative level, will be hired, assigned, promoted, paid, demoted, dismissed, or otherwise treated without regard to race, color, or national origin, and that the district shall assign staff so that the ratio of Negro to white teachers in each school and the ratio of other staff are substantially the same as each such ratio is to the teachers and other staff in the entire school system. The decision is troublesome primarily because of misuse and misinterpretation.

**WITH ALL DELIBERATE SPEED**

I think that the judges made a tactical error in that they misjudged the mood of school people when they issued a statement in 1955 indicating that systems need not comply forthwith, but indicated that they could proceed with “All Deliberate Speed.” My own system, and many other systems, had their maps drawn assigning students to the nearest school. They were waiting for the Court to say “Go.”

Most school central office staffs were tired of the dual school system which meant two principals’ meetings, two PTA Council meetings, two teachers’ meetings, two curriculum council
meetings, two textbook committee meetings, etc., etc., etc. They secretly welcomed the 1954 Decision for physical reasons.

After the 1954 Decision, the maps disappeared and many of the dual meetings were restored. By this time, the politicians, governors, senators, and congressmen got into the act, and no superintendent who wanted to work was going to integrate schools in the face of this kind of pressure, Court or no Court, and the move to suburbia was on. (The neighborhood patterns in the South in 1954 made desegregation without busing a very simple matter.)

One problem with desegregation is that by and large many of the same people who were in charge in 1954 are still in charge—"The foxes are in charge of the chickens." So devastation of Black teachers continues in the South in spite of the Guidelines and in spite of the Court Decisions. The foxes have learned how to hide their displacements. They know that they can't overtly discriminate; so they have new ways of displacement.

Black teachers who retired or moved away were either not replaced or replaced by whites. Standardized tests, such as NTE and GRE, were used to evaluate teachers or screen out teachers. Responding to the court requirement that objective criteria be used in dismissing Black teachers under a desegregation order, West Feliciana Parish, Louisiana utilized a form of NTE to dismiss twenty-nine teachers. An injunction was secured by LEA and NEA to prevent their dismissal. In Columbus, Mississippi, ten teachers were dismissed on the basis of NTE scores. The teachers were ordered reinstated with over $100,000 in back pay and legal fees.

Fewer and fewer Black recruits are able to find teaching positions in either rural or city systems in the South. Many tenured Black teachers have been placed in federal programs with contracts that indicate their rehiring is dependent on refunding. Some Black teachers are placed out of their fields so that their dismissal can be justified on the basis of poor performance.

NO MONITORING AND LACK OF INFORMATION

The lack of effective data collection throughout the first fourteen years of desegregation will prevent the true impact of the Brown Decision on Black educators from ever being really known.

Soon after I arrived at NEA in 1964, I heard rumors that large numbers of Black teachers had lost their jobs in Oklahoma and Missouri, and perhaps a few other places, on the basis of desegregation. We also received a number of requests from Black teachers associations in the South asking that the NEA establish programs to prevent such mass dismissals when the expected desegregation came to the eleven Deep South states as a result of implementation of the Civil Rights Act of 1964.

On the basis of this sketchy information, I approached the powers that be in the NEA and requested that programs be instituted. I received a series of questions which I shall never forget. "Where?" "How many?" "What is your source?" "Can't be documented?" "Why can't their placement offices in their Alma Maters find them new positions?"

I assumed that this would be a relatively easy task. I would check with the Department of Education in each state, and it would be a simple matter of computation. I was to receive another rude awakening.

The Departments of Education in the seventeen southern states allegedly stopped keeping school statistics by race after 1954. Thus, it became almost impossible to find out comparative official racial employment figures between 1954 and 1964. The only reliable source of racial data on either faculty or students in the seventeen southern states for the period in question was the Ford Foundation-supported Nashville-based Southern Education Reporting Service. From SERS files we were able to document that approximately 3,000 Black educators had lost their jobs in Oklahoma, Missouri, Kentucky, West Virginia, Maryland and Delaware from 1954 to 1964. Even though the actual number of Black educators was believed to be much higher, these
statistics gave the first credibility to our predictions that many more Black educators might lose their jobs unless HEW and the Courts made special efforts to prevent a rerun of the saga of the border states.

A reporter from one of the major daily newspapers got wind of my concerns and predictions, and in the resulting interview pushed me for a figure. “How many people will lose their jobs?” “I don’t know!” “But what is your best guess?” “5,500 over a period of several years” was my reply, even though I believed strongly that it would be much higher. (But it is my style to err on the side of understatement rather than overstatement.) The 5,500 figure was big enough to capture the imagination of the press and the Civil Rights activists. Soon the 5,500 figure became gospel rather than an educated guess of one person who was willing to express an opinion on the matter.17

The first hard data on the subject was gathered by an NEA Task Force survey on Teacher Displacement, under a grant from HEW.18

Directed by Robert Cousins, coordinated for HEW by Allan Lesser, and coordinated by the author for NEA, the task force of twenty-five researchers and scholars documented through personal interview and inventory 668 cases of displacement of Black educators for the year 1965 alone. Thus, the Congress saw the need for such data. By 1970, the Office of Civil Rights of HEW started to develop nationwide reliable comprehensive racial data by school, district and state.

When these raw data were released in 1972, Don Shire, Boyd Bosma, and I did an analysis of the data and developed comparative losses based on the projected number of teaching positions that would have been available to Black teachers had the schools remained segregated.

At the NAACP Legal Defense Fund workshop, May 19, 1972, the nation was shocked when we announced that 31,584 teaching positions had been lost by Black teachers in the seventeen southern states by 1970, as a result of desegregation.19

Based on the average salary for each state, we computed the loss in income to the Black community in those seventeen states for 1970–71 alone as $240,564,911.00, nearly a quarter of a billion dollars. The cumulative amount is staggering to the imagination.

Two years later, this displacement factor had increased to 39,386 in those states (see Table A5.1). The Black student population in the South had increased from twenty-one percent to twenty-three percent, while the Black teacher population had decreased from nineteen to seventeen percent.20

In 1972, at the annual meeting of the Association for the Study of Afro-American Life and History, I was asked to give equal treatment to the North, the East, and the West on employment discrimination. In response, I reported that the nation needed 210,000 more minority teachers in order to achieve any kind of equity in hiring based on the presence of minorities in the public schools.

“To the 186,000 Black teachers now employed, we need to add another 116,000; to the 23,000 Spanish-speaking, we need to add 85,000 (almost 300 percent); to the 7,300 Asian and Pacific Islanders, we need to add 3,000; and to the 2,900 Native Americans, we need to add another 7,400.”21

The school systems of Boston and New York City stood out as the most flagrant violators. On the basis of statistical projections and evidence of discriminatory hiring practices brought by local groups, judges in both cities have since ordered the school boards in both cities to significantly increase the numbers of minority teachers and administrators.

At the 1975 Southern Christian Leadership Conference in Anniston, Alabama, we projected that the nation would have to employ 5,368 more Black principals to reach equity and parity.22

The estimated loss of Black principals due to discrimination in the seventeen southern and border states is 2,235. This formula takes into consideration the number of schools closed for consolidation and other reasons as well as new schools which have opened. Since Texas had more than 700 Black principals in 1964, we could have used that figure, but we have used a projected number of 581. In 1966, North Carolina had more than 625 Black principals; yet, we

</table>
have used a projected figure of 536. In Kentucky, the actual number of Black principals was over 400, yet we have used a 1972 projection of only 98. If we were interested in rhetoric, we could use the 1954 number of Black schools and show high losses, many of which are due to population decline, shifting population, and school consolidation (see Table A5.2).

San Antonio, Texas is the only large school district in the nation where the Black principal ratio and the Black student ratio are equal (16 percent and 16 percent). But San Antonio has a significant disparity in the ratio of Spanish-speaking principals to Spanish-speaking students. Washington, D.C. is the only other major city which comes close. Boston is consistent in that it is public enemy number one for the Black principal as it was for the Black teacher and, more recently, the Black student.

### NEED FOR MONITORS

As helpful as the Office of Civil Rights data have been in making the judges, news media and the people aware of the inequities in hiring in their districts, there is almost a two-year time lag between the collection and the release of the data in meaningful form.

The NEA Task Force on Louisiana and Mississippi recommended, among other things, that the judges appoint monitors to observe the desegregation process and report back to the judges on progress.

On September 9, 1970, we inadvertently discovered the importance of monitoring after the Attorney General of Mississippi placed an injunction on the NEA Associate Director of the Atlanta Region, Jimmy Williams, and on me, and threatened to jail us because we attempted to monitor the desegregation process in several Mississippi school districts. No doubt, they had something to hide.

Since 1968, it has become a common practice for judges to establish biracial committees and

monitoring groups to help them evaluate the reports supplied by the system. In some instances, judge have dismissed the school board and appointed themselves or someone else to oversee the school operation on a temporary basis. Such practices are long overdue and should be expanded.

1975 DATA ENCOURAGING

Boyd Bosma, in a study for the National Institute for Education, has done an analysis of 1975 OCR data which yields some interesting things. His findings are summarized below:

1 Affirmative action in education seems to be working in some places. Minority teachers (primarily Spanish-speaking) account for nearly 40 percent of the 150,230 new teaching jobs which were added between 1970–71 and 1975–76; but not nearly enough to reach the 210,000 called for on the basis of 1972 data.

2 Nationwide, Black teacher employment increased from 9.4 percent of the teaching population to 10.2 percent. This increase represents a 15 percent decrease in their actual numbers.

3 Hispanic teacher employment increased by almost 15,000, from 1 percent to 1.6 percent of the teaching population. This represents an increase of 79.3 percent since 1972, but is still a long way from 85,500 which I projected at the Tucson Conference.

4 Asian American teacher employment increased by 52.6 percent and First Americans increased by 103.5 percent. But this represents relatively low numerical gains in spite of the impressive percent gains.

Keep in mind that the above figures represent national gains and will be misleading for this paper without some analysis of the data for the South where the Brown Decision had its original focus. Bosma’s summary of the 1975 data for the South is as follows:

1 Approximately 65 percent of the national increase in the number of white teachers between 1970–71 and 1975–76 occurred in the South.

2 The 49,306 white teachers hired during this period were more than the total number (48,444) minorities hired throughout the nation.

3 Six white teachers were employed for every Black teacher employed in the South during this period.

4 In addition to the 39,386 displacement factor shown in the 1972 data in seventeen states, additional 8,430 position losses were projected in the eleven states alone (47,816).

5 In spite of the increase in the teacher population, the total number of Black teachers employed decreased in Alabama and South Carolina. In addition to the above, the ratio of Black to white teachers decreased in Arkansas, Florida, Mississippi, North Carolina and Virginia. Increases in the ratio of Black to white are reported in Georgia, Louisiana, Tennessee and Texas.

I believe that most judges, even those who are hard to convince, are honorable persons and that if the disproportionate burden of desegregation which was placed upon the backs of Black educators and students had been known to them, it would not have been allowed to the same degree.

NOT AN EDUCATION DECISION

As stated at the outset, the impact of Brown v. the Board of Education on Black educators in terms of employment opportunities lost during the first twenty-five years was devastating. If the
Brown Decision was a decision about education *per se*, I would be the first to criticize it. As I view the Decision, it was a decision about rights and in the scheme of things education just happened to come first and took a terrible beating for it.

In my view, it was a decision about the right to the best public education the nation could afford. It was not a desegregation plan. It was about the right to be served a hamburger at any counter in the store. It was about the right to sit or stand in any section of the bus. It was about the right to buy a house and live in it in any neighborhood one can afford.

It was about the right to secure training in any occupation to get a job in it at the end of that training.

It was about the right to vote and the right to run and hold office.

The statistics reveal that the Decision has not been all losses. There have been some gains which were hard to discern at first but now may have some relevance for a reversal of some of the losses in the South and acceleration of gains in the North.

In 1954, there were no Black superintendents, and less than a dozen at the assistant superintendent level. There were approximately 200 Black persons called “Jean’s Supervisors” or “Jean’s Teachers” who could be counted as part of the central office staffs. The 1975 OCR data indicate that more than 1,000 Black educators hold central office jobs, including several superintendents, including major cities such as Richmond, Atlanta and Miami; scores of assistant superintendents and hundreds of directors of various federal programs (see Table A5.3).

Black administrators make up 17.2 percent of the central office staff personnel in Louisiana; 15.5 percent in Mississippi; 14.2 percent in Maryland; 14.1 percent in Alabama; 12.9 percent in South Carolina; 11.7 percent in Georgia and 11.5 percent in North Carolina.
